CHRONOLOGY OF REMARKABLE EVENTS.

JUNE 29, 1851, TO DECEMBER 22, 1851.

JUNE.

29.—Grand banquet at Derby to Mr. Fox, contractor for building the Crystal Palace.

30.—New Church of St. Matthew, Westminster, consecrated.—The Earl of Derby died, aged 77.—Kaffirs defeated in the Amatola mountains; 2000 head of cattle captured.

JULY.

1.—A boy killed, in Hyde Park, by a decayed branch of a tree falling on him.—New Middlesex Lunatic Asylum, Colney Hatch, inaugurated.—Colliery explosion at Cradley, Worcestershire: 9 persons killed.

3.—Foundation stone of a new grammar-school at Ipswich laid by Prince Albert.

4.—Cotton-mill at Hurst destroyed by fire: loss, £7000.—Entertainment, at Willis' Rooms, by Mr. G. Peabody, American merchant, to the American Minister.

5.—A charcoal-dealer, in Paris, committed suicide by throwing himself from the Colonne of July.—The Queen went in state to Her Majesty's Theatre.—Great gathering of juvenile attendants at Edinburgh: 70,000 persons present.—Excess of Government income over expenditure for year ending this date, £3,032,776 7s. 5d.

6.—Dr. M. Moir died.—New law against the press, of extreme stringency, published in Austria.

7.—Mrs. Goode died at Stonelaigh, aged 102.—The steamer *Ewrine* arrived at Southampton with 130 Hungarian and Polish officers and men from Turkey.

8.—Mr. Berkeley's motion, to bring in a bill to vote by ballot, carried in the Commons by a majority of 37.

9.—Grand ball at the Guildhall, London, to her Majesty.

10.—The Parliamentary Income Duty Bill passed in the Commons.—Meeting of the British Association at Ipswich: Prince Albert present: Professor Airey elected President.

11.—Entertainment, at North Woolwich, by Mr. Peto, to operatives of Norwich.—M. Daguerre, inventor of the Daguerréotype, died, aged 63.

12.—Grand entertainment, at Liverpool, on board the steamer *Atlantic*, in honour of the Great Exhibition.—The Emperor Faustin I. of Hayti defeated by the Domiciens at Cotoy, with a loss of 900 slain and 245 prisoners.

13.—Fire in Bush-lane, City: loss £8000.—Two females killed, in a dwelling-house at Pau, by lightning.

14.—Lord Campbell presented a petition, in the Lords, against the permanence of the Crystal Palace.—Lodging-houses Bill passed in the Lords.—The Earl of Charleville died.—Royal Agricultural Society's Show held at Windsor.

15.—General Magnan (Bonapartist) appointed Commander-in-Chief of the army of Paris.

16.—Mr. Baines elected M.P. for Arundel.

17.—Dr. Lingard died, aged 81.—Jewish Disabilities Bill lost in the Lords.—Serious inundation at Philadelphia (U. S.)

—Cholera raging at St. Louis.—Cholera raging fearfully in Jamaica.—Revolution in Equador (South America); General Urbina at the head of affairs.

18.—Lieutenant Salomons appeared in the House of Commons to take the oaths and his seat as member for Greenwich: ordered to withdraw.

19.—French Legislative Assembly rejected the proposal for revision of the Constitution.—Superb testimonial presented to Mr. O'Byrne, author of the "Naval Biographical Dictionary."

20.—Marshal Sebastiani died at Paris, aged 80.—188 monks drowned at the convent of Wladimir, through a bridge breaking, which they were crossing in religious procession.

LONDON: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by WILLIAM LITTLE, 198, Strand, aforesaid.—JANUARY 10, 1852.—SUPPLEMENT.

THE ILLUSTRATED LONDON NEWS.

No. 498.—VOL. XIX.] SATURDAY, JULY 5, 1851. [TWO NUMBERS, 1S. WITH HALF-SHEET SUPPLEMENT GRATIS.

WHAT IS TO BECOME OF THE CRYSTAL PALACE?

SUCH is the question which has been asked of the public within the last few days, by no less a person than Mr. Paxton. A similar question has simultaneously been put by a gentleman styling himself "Denarius," who is understood to be an efficient member of the Executive Committee. If any one person more than another has a right to be heard upon this subject with respectful attention, it is certainly the man to whose creative genius we owe that marvellous and beautiful edifice; but, as the two pamphlets which have been sent forth go over the same ground, we shall consider their suggestions together. Between Mr. Paxton and Denarius there is no difference of opinion. Both desire and strenuously advocate the retention of the Crystal Palace in Hyde Park, and suggest novel and admirable uses for that novel and admirable Building—uses utterly unimagined by every one except by Mr. Paxton himself, when he first drew out the scheme, which, happily realised, made the Exhibition popular.

The Commissioners of the Exhibition, as Denarius reminds the public, have not only solemnly pledged themselves that any surplus remaining in their hands after the whole expenses of the Building and the management shall have been liquidated, shall be applied to purposes strictly in connexion with the ends of the Exhibition, or for the establishment of similar Exhibitions in future, but that the Building shall be taken down. But we should remember, that, at the time they entered into this engagement, Mr. Paxton's Crystal Palace had not been imagined; or, if imagined by Mr. Paxton himself, was as yet a secret idea in his own poetical mind. A huge brick building, or a building half brick and half iron, was the only edifice at that time present to the public comprehension; and when the House of Commons affirmed, in July, 1850, by a majority of 166 votes against 47, that the Building, whatever it might be, should be removed at the end of the season of 1851, it was a large brick building which was contemplated. Will the House of Commons, in July, 1851, with Mr. Paxton's beautiful Palace in existence, an object of admiration to all Europe, affirm its decision of 1850, and insist that the fairy structure shall be removed? That is the question which must be decided before the members of the Lower House shall, a month or six weeks hence, betake themselves to the moors. If, not the New Year will see the sward of Hyde-park as bare as it was before the Exhibition was dreamed of, and Mr. Paxton's fair creation will have vanished like a *fata morgana*—as beautiful, but unfortunately as transient. If public opinion express itself in terms sufficiently strong, the Building will be spared; and to show *why* it should be spared, and to prove at the same time the comfort, pleasure, beauty, and improvement that would result, is the object of Mr. Paxton's earnest little pamphlet, and of the equally well-meant pamphlet of Denarius.

Mr. Paxton expressly declares that the removal of his Building never entered his thoughts "When I determined," says he, "on sending in a design, I had in view quite as much the after purpose for which the edifice could be adapted, as the object then more immediately required; and, in my original prospectus, I prominently mentioned the fact as one which had received a large share of my attention. Since that day nothing has happened to alter my views; but, on the contrary, everything has contributed to strengthen and establish them." He proposes, therefore, that the Building should remain standing, to supply a great public want—a winter park and garden under glass—for the use and enjoyment of London and its two-and-a-half millions of inhabitants."

Denarius proposes, in the title of his pamphlet, that the Crystal Palace should be kept for "riding and walking, in all weathers, among flowers fountains, and sculptures;" a proposition which, with the sole exception of the admission of equestrians, would meet, we believe, with the general and warm support of the community; and which, even as respects the riding, might not turn out to be objectionable. Mr. Paxton's proposal includes the admission into certain spaces of the Building of horses and carriages—and in addition, to the adornment of the whole of the beautiful enclosure with the trees, fountains, and statues which are indissolubly associated with it in the popular mind—suggests various other uses, which, if carried into effect, would make the Crystal Palace more fairy-like and elegant, more useful and ennobling, after the close of the Great Exhibition than it was before. When we say this, we do not know what higher praise it is possible to bestow. But we must quote Mr. Paxton's proposal in his own words:—

"A building like this, if properly laid out, will open a wide field of intellectual and healthful enjoyment; it will likewise, I hope stimulate the wealthy in large manufacturing towns to a similar adoption of what may now be raised so cheaply; and when judiciously furnished with vegetation, ornamented with sculpture and fountains, and illustrated with the beautiful works of Nature, how pure, elevating, and beneficial would its studies and exercises be! At present England furnishes no such place of public resort; for, although Kew has a splendid palm-house, where daily are congregated a great number of individuals, yet its warm and humid atmosphere is only calculated to admit of visitors taking a hasty view of the wonders of the tropics as they pass in their walks through the gardens. On the contrary, in the Winter Park and Garden I propose, climate would be the principal thing studied

GODIVA PROCESSION AT COVENTRY FAIR.—THE PROCESSION FORMING AT ST. MICHAEL'S CHURCH.—(SEE NEXT PAGE.)

all the furnishing and fitting up would have special reference to that end, so that the pleasures found in it would be of a character which all who visit could share. Here could be supplied the climate of southern Italy, where multitudes might ride, walk, or recline amidst groves of fragrant trees, and here they might leisurely examine the works of Nature and art, regardless of the biting east winds or the drifting snow.

"In this Winter Park and Garden the trees and plants might be so arranged as to give great diversity of views and picturesque effect. Spaces might be set apart for equestrian exercise, and for carriage drives; but the main body of the Building should be arranged with the view of giving great extent and variety for those who promenade on foot. Fountains, statuary, and every description of park and garden ornament, would greatly heighten the effect and beauty of the scene. Beautiful creeping plants might be planted against the columns, and trailed along the girders, so as to give shade in summer, while the effect they would produce by festooning in every diversity of form over the Building, would give the whole a most enchanting and gorgeous finish. Besides these, there might be introduced a collection of living birds from all temperate climates; and the science of geology, so closely connected with the study of plants, might be illustrated on a large and natural scale; thus making practical botany, ornithology, and geology familiar to every visitor."

Mr. Paxton enters into a calculation to show at what cost the change might be effected, and the Crystal Palace be kept open to the public for the highly intellectual physical enjoyments which he proposes to afford us. With a view to the more perfect crystalisation of his crystal structure, he recommends the removal of the wood boarding round the bottom tier of the Building, so that it might be made transparent, and that the public without, when passing by, might be tempted by the glimpse to indulge themselves with the luxury of a walk within. He makes the proposal, not simply with the view of increasing the beauty of the Building, but that he may remove the last possible shred of objection that may be raised by the owners of house property and the inhabitants of the neighbourhood. By the removal of the hoarding and the substitution

removed, it became desirable that the House should once more take into consideration the financial position of the country. With respect to the principle of direct taxation, he would say, that, even admitting the principle, he still thought it should be resorted to with great caution—that it should be justly apportioned and placed upon the widest possible basis. The mere fact of asking the renewal of the Income-tax for a fourth time was equivalent (if agreed to) to its perpetuity, and the Minister who proposed it should have taken especial care that its injustice should have been abated—an injustice submitted to only because the tax was believed to be temporary. The Government had never admitted exemption made the tax inequitable, and hence the position in which they were now financially placed. Without deciding whether the Window-tax was or was not the best tax to repeal, he would say if the substitute for the tax—the inhabited House Duty—did not really affect all the faults of the Income-tax. It was a direct tax, and at the same time was limited and unequal in its operation. The results to be anticipated from it to the revenue would be insignificant. No tax should be imposed by Government unless the revenue could be relied upon as positive and permanent surplus. If, however, any tax were to be repealed, it ought to be a tax pressing upon the interest which it was defended on all hands were most oppressed—more agricultural interest. In the early part of the session he had pressed upon the House the case of the agriculturists; but having failed to get his views adopted, he had quietly submitted to the scheme of the Chancellor of the Exchequer. The vote on the motion of Mr. Hume, however, had changed the whole financial aspect of affairs, and left the revenue of the country in a provisional condition. It therefore became the duty of the Government to revise their financial measures, and to endeavour to bring their projects and proposals in closer harmony with each other. The Income-tax was so full of odious qualities that he did not believe it would be renewed, and it was therefore undesirable to abrogate a tax to which the people had become accustomed in the hope of having to invent new ones to supply their place. With respect to the alteration of the timber duties, he suggested that the British shipowner would be largely benefited by being allowed to build ships for a term of years, which, however, with the Government had not granted. With respect to the Window-tax he would say, in the name of the party with whom he acted, that they would support the Chancellor of the Exchequer, provided it were to be really repealed and not converted into a house-tax. The hon. Baronet assumed his seat amidst very general cheering.

The CHANCELLOR of the EXCHEQUER said the motion and the speech of the hon. Baronet were wholly inconsistent, for his proposition went the length of not only submitting that no taxes should be repealed, and yet he tendered his own support and that of his party to repeal the Window-tax, provided it were to be a total repeal. He (the Chancellor of the Exchequer) had never at any time admitted that he was wrong in supposing that his (the Chancellor of the Exchequer's) calculations, as regarded the revenue, were based upon the permanency of the Income-tax, for he never advocated the permanency of that impost. The hon. gentleman professed to be anxious for the repeal of the Window-tax; but if so, he ought, with his present opinions, to have passed before he voted for Mr. Hume's motion, which he now must lead to the defeat of any such measure as the repealing that tax. The question now, however, was as to whether the Window-tax was to be repealed or not? and those who thought it ought to be should oppose the motion of the hon. gentleman, the object of which was to prevent the repeal of a tax which he professed himself anxious to put an end to. The question was—would they have the Window-tax? Ay, or no? and with that understanding he left the motion to be decided by the House.

Mr. NEWDEGATE supported the views of Mr. Disraeli.

Mr. GLADSTONE supported the motion, being entirely opposed to the inequality and injustice of a house-tax, which was, besides, a mode of taxation objectionable, because of its resting upon a limited and an illegitimate basis. The right hon. gentleman proceeded to contend, that it was unlikely the Income-tax would ever be renewed, because of the division of opinion in the House upon the principle which should govern it; and as so large a portion of the revenue of the country was placed in such a precarious position, they ought not to tamper with other portions of the revenue also.

Mr. LABOUCHERE opposed the motion, insisting that the people of England would be deeply disappointed if the Window-tax were not to be repealed.

Mr. HUME, in opposing the motion, said he agreed in the repeal of the Window-tax, and also agreed to the imposition of a house-tax, but not in the shape in which it was proposed by the Chancellor of the Exchequer that it should be levied. The House-tax was a property-tax, and it should apply to all houses, large and small indifferently. There should, in his opinion, be an inquiry into the whole system of taxation in the country, of which inquiry he regarded that relating to the Income-tax as the first step.

The House then divided, and the numbers were—

For Mr. D'Israeli's motion	..	..	..	129
Against it	..	..	..	243
Majority	..	..	..	—113

The Inhabited House Duty Bill was then passed through committee.

BOARD OF HEALTH.

The General Board of Health Bill was read a third time and passed, after a short discussion, on a motion of Mr. FULLER to insert Hastings in the schedule, which was carried upon a division.

MERCANTILE MARINE.

Mr. LABOUCHERE obtained leave to bring in a bill to amend the Mercantile Marine Act.—Adjourned at a quarter past 2.

HOUSE OF LORDS.—TUESDAY.

SMITHFIELD MARKET.

Lord BEAUMONT referred to the rejection of the Smithfield Market Removal Bill by the committee of the House of Lords that morning on the ground of the non-compliance with the standing orders; and he moved the appointment of the following resolution:—"That in considering that the Smithfield-market Removal Bill partakes more of the nature of a public than of a private bill, this House is of opinion that compliance with the standing order of the House should not be required in the case of this bill, but that it should be proceeded with in all respects as a public bill."

Lord REDESDALE opposed the motion, inasmuch as the bill dealt with private property.

After some discussion, in which Lords BROUGHAM and LYNDHURST supported the views of Lord Beaumont, the motion was withdrawn, and

Lord BEAUMONT gave notice that he would again bring it forward on Friday.

THE LAW OF PATENTS.

Earl GRANVILLE, in moving that the House go into committee upon the Patent Law Amendment Bill, explained that its main objects were to remedy the delay and expense now felt in procuring patents, and to remove the inconvenience of granting three patents for the United Kingdom.

The measure met with general approval, and passed through committee.—Adjourned.

HOUSE OF COMMONS.—TUESDAY.

The House met at noon.

The County Court Further Extension Bill passed through committee; also the Ecclesiastical Property Valuation (Ireland) Bill.

At the evening sitting,

CHURCH EXTENSION.

The Marquis of BLANDFORD brought under notice the question of Church Extension, illustrating his views with many details, and moving—"That an humble address be presented to her Majesty, praying that she will be graciously pleased to take into her consideration the state of spiritual destitution existing throughout England and Wales; with a view that her Majesty may be pleased to direct the adoption of such measures as she may deem expedient, for affording more efficient relief to the spiritual wants of the people, and for an increase of the pastoral superintendence corresponding to the growth of a rapidly increasing population, by the help which may be drawn from the resources of the Established Church itself."

Lord ROBERT GROSVENOR seconded the motion.

Mr. HUME moved, not in hostility, but with the view of submitting his views as to the means by which the evils of religious destitution could be best removed as an amendment upon the motion. "That there be laid before this House an account of all lands, houses, mines, tithes, and all property of every sort or kind whatsoever, belonging to the Church of England, or to any bishopric, or any capitular or ecclesiastical corporation, sole or aggregate, setting forth the nature and extent of the property, and where situated; in whose possession or to whom leased, and the date of such lease and by whom held; the period for which the lease was granted, the fine, if any, taken at the time of granting the lease; the names of the parties by whom that fine was received, and the amount paid to each party; also, the rent reserved, and the annual value at which such property is now rated to the relief of the poor; and if tithes, the amount of the same; or if commuted, the annual rent-charge; the return for each bishopric and ecclesiastical and capitular body to be given separately."

Sir B. HALL entered into various details to show that the bishops of the Established Church had revenues more than necessary for their positions, and gave his plan of Church reformation, by which the bishops should not be permitted to sit in the House of Lords, and the whole revenues of the Church should be taken by Parliament, and re-distributed in such a manner as that no bishop should have more than the salary now given to the Premier, and no curate should have less than £300 per annum.

After some observations from Mr. MORRIS and Mr. A. J. B. HOPE,

Sir G. GREY admitted the importance of the subject, but could not see how they could do more by this address than they had already done in committee, and measures already under consideration of both Houses of Parliament. He thought the proposed sale of advowsons of such importance, that it ought to be considered, not incidentally, but as a subject which of itself demanded the most serious attention. Doing all justice to the motive of the most noble Marquis, he yet felt that it was requisite, under the circumstances, to meet it with the amendment of the previous question. With respect to the amendment of Mr. Hume, he thought that if they were to go to it, they must wait for an indefinite period in order to obtain such multifarious information.

Mr. SIDNEY HERBERT supported the motion.

Sir B. HALL replied to the course of argument adopted by Sir B. Hall, which was calculated to cast obloquy on the dignitaries of the Church. He believed that no Church establishment in Europe had done more for the benefit of the middle and poorer classes than the Church of England, and he did not think that her Majesty could do anything in accordance with the address which he had read to any beneficial result.

Mr. ALCOCK opposed the motion.

Mr. GOULBURN deprecated the charges made upon the bishops by Sir B. Hall, which was, he thought, actuated by feelings anything but friendly to the Church.

Mr. HERBERT defended Sir B. Hall, and strongly supported the motion of the Marquis of Blandford; in doing which he severely commented on the conduct of the bishop of Gloucester in reference to the Horfield estates.

Mr. WIGRAM did not at all approve of the sale of the Crown livings, but he should nevertheless support the motion if the hon. gentleman decided upon pressing it to a division.

Mr. BOOKER defended the Bishop of Gloucester from the attack made upon him by Mr. Horsman.

Mr. B. OSBORNE said that the charge was a grave one, and called upon Mr. Goulburn to affirm or deny the charge against the Bishop of Gloucester.

Mr. GOULBURN said he had no means of knowing the facts.

The Marquis of BLANDFORD shortly replied, and, at his request,

Mr. HUME withdrew his amendment.

Sir G. GREY then said, that, if it were to be understood that the sale of the advowsons in the gift of the Lord Chancellor was not to be considered as agreed to by this motion, he would not oppose its being adopted by the House.

Upon this understanding the motion was agreed to without a division.

EQUITY ON CARRIAGES.

Sir DE LACY EVANS moved for leave to bring in a bill to reduce the duty on carriages.

The CHANCELLOR of the EXCHEQUER opposed the motion, as calculated to derange the financial arrangements of the year. At the same time, he was willing to admit that a change might be made without any loss to the revenue.

After a short discussion, the motion was withdrawn.

CLEOPATRA'S NEEDLES.

Mr. HUME moved an address to her Majesty, that she will be pleased to give directions that the granite obelisk, given by the late Mehemet Ali to the British nation, (which obelisk is now lying on the beach at Alexandria), may be brought to England, and that this House will grant such funds as may be requisite to bring it to and erect it in an appropriate situation in England.

The CHANCELLOR of the EXCHEQUER said, that the obelisk had sustained so much injury from the sea air, that it was the opinion of competent judges that it was not worth the expense of removal.

After a short conversation the motion was withdrawn.

Adjourned at half-past twelve o'clock.

HOUSE OF COMMONS.—WEDNESDAY.

The House sat from noon to six o'clock.

The Ecclesiastical Residences (Ireland) Bill, the Churches and Chapels (Ireland) Bill, and the United Church of England and Ireland Bill were each read a second time

PHARMACY.

The second reading of the Pharmacy Bill was moved by

Mr. JACOB BELL, who described it as a measure for improving the qualification of pharmaceutical chemists, and designed to establish the principle that such persons should be duly educated and examined.

Mr. HUME opposed the bill, for which, he said, there would be no necessity, if the Apothecaries' Company would do its duty.

Mr. BERNAL supported it, as calculated to check the sale of drugs by ignorant men.

Mr. HENLEY thought the bill so unskilfully devised, that, if carried, it would be inoperative.

Sir GEORGE GREY thought that the bill could not be passed in its present shape. The profession ought to have full opportunity for considering it. He would not oppose the second reading, on the understanding that, after the bill had been committed, it was not to be carried further this session.

Mr. CARDWELL approved of the object of the bill, but advised Mr. Bell to accept Sir G. Grey's proposal.

The bill was read a second time.

The Public Houses (Scotland) Bill was withdrawn.

Some other measures were advanced a stage, and the remainder of the sitting was occupied by the discussion in committee of the Medical Charities (Ireland) Bill.

HOUSE OF LORDS.—THURSDAY.

The Royal assent was given by commission to several bills, amongst which were the Stamp Duties (Ireland) Continuance, Compound Householders, Court of Chancery (Ireland) Regulation Act Amendment, Highways (South Wales), Process and Practice (Ireland), Prevention of Offences, and Fee-Farm Rents (Ireland).

The Lords Commissioners were the Lord Chancellor, Lord Minto, and Lord St. Germans.

MR. ROBERT OWEN.

Lord BROUGHAM had a petition to present from a very celebrated man and a great public benefactor, he meant Mr. Robert Owen. That gentleman held peculiar opinions, but he was a great public benefactor for he was the founder of infant schools. His petition was for facilities for, bringing forward his scheme for the improvement of society, and he thought that the petitioner should be afforded an opportunity of appearing before a select committee of their Lordships' House. The late illustrious Duke of Kent, the father of her Majesty, had been a patron of Mr. Owen's plan, and a man more religious or more attached to the Church than his late Royal Highness the Duke of Kent it would be difficult to find. Of all men, Mr. Robert Owen was the most moderate, the most tolerant, and the most accessible to reason; and he therefore hoped their Lordships would give a respectful hearing to his petition. He moved that the petition be read at the table.

The motion was agreed to; and the petition, which was of considerable length, was read accordingly.

The Marquis of LANSDOWNE thought it would be impossible that a select committee, appointed at this late period of the session, could enter satisfactorily upon so large a subject.

STEAM NAVIGATION TO AUSTRALIA.

Lord LYTTELTON rose to ask the noble Earl opposite whether it was the intention of the Government to carry out the recommendations of the Committee of the other House for establishing steam communication with Australia?

Earl GREY (who was at first inaudible in the midst of conversation prevailing in the House) was understood to say that the Government were inclined to adopt the plan of steam communication with Australia rid the Cape of Good Hope.

Lord WHARNCLIFFE presented a petition complaining of the adulteration of coffee.

Several bills on the table were forwarded a stage, and their Lordships adjourned.

HOUSE OF COMMONS.—THURSDAY.

OATH OF ABJURATION (JEWS) BILL.

Lord JOHN RUSSELL moved the third reading of this bill.

Sir R. INGLIS said, ever since the first time when a bill on this unhappy subject was introduced, he had always regarded it as one of the most unfortunate measures which had been brought before Parliament. He looked upon it with the greatest abhorrence and the strongest repugnance, and he believed it was both uncalled for and undesired by the great mass of the people. On the present occasion, however, he should not call upon the House to divide, but would content himself with expressing once more his solemn objection to a measure which would have the effect of destroying the Christian character of the House. (Hear.)

Lord J. RUSSELL thought it right to offer a few words in explanation to the observations of the hon. Baronet the member for the University of Oxford. It was well known that a Jew was ready to swear to all the oaths contained in the present oath of abjuration supremacy. That cause the question was the oath of abjuration imposed in order that all members who entered the House should declare themselves Christians? Now, he believed that neither those who proposed or who supported the oath of abjuration ever dreamt of its necessity on that ground. It was introduced solely for the purpose of making persons declare that they would bear allegiance to the family now on the throne, and not to the descendants of James the Second, the representatives, therefore, of the cause of allegiance, supremacy, and abjuration the Jew was ready to swear and subscribe; but no doubt the words at the end of the last oath placed him in a position of difficulty, and precluded it being administered to him in that form. He (Lord John Russell), however, would not but think that on this question the wishes of the people at large ought to be very much consulted, and especially electors of members of Parliament. (Hear.) Within the last few days a second member of the Jewish persuasion had been elected as a representative for a borough by a majority of nearly 900 votes. (Hear.) He was glad to see that the honourable Alderman who had been thus elected had declared it his intention not to come down and offer to take his seat until the other House of Parliament had an opportunity of considering the present bill. (Hear, hear.) He (Lord John Russell) was ready to meet the views of that other House of Parliament in regard to the sentiments which had been evinced upon one clause of the bill, and, if necessary, to withdraw it. Now that the House of Commons was about, for the third time, to declare that Jews have a right to sit in this House, he thought it was quite time that the House of Lords should consider what was due to the people. With regard to popular elections, it struck him that the present state of the case gave Jews a most decided advantage as against Christians, because the Jew was able to hold himself out to the voters as a persecuted man, and one in whom was centered the principle of religious liberty. He did not think, that, even if this bill passed, its effect would extend beyond admitting one or two Jews into Parliament, and would certainly not give them any advantage over Christians.

After a short conversation, the bill was read a third time, and passed without a division.

COURT OF CHANCERY AND JUDICIAL COMMITTEE BILL.

This bill passed through committee, after considerable discussion.—Adjourned.

MARTIN'S REGISTERED NUTMEG-GRATER.—This very useful improvement consists of a pierced tin cylinder (the grater), which is turned by a winch, within a japanned case; and the nutmeg being pressed against the cylinder by a sliding serrated perforated holder, as the former revolves, the grated nut falls out beneath.

NEW CHURCHES.—From a return printed by order of the House of Commons, it appears that the charges and expenses of her Majesty's Commissioners for Building New Churches, from 25th March, 1850, to 25th March, 1851, amounted to £3827.

The Liverpool papers record the loss of the American emigrant ship *Halcyon*, which sailed from that port on the 17th ult., with upwards of 300 passengers, principally Irish and German emigrants, for New York. The whole of the passengers and crew, with the exception of one woman and a child, were providentially rescued from a watery grave, having been humanely taken on board, almost in the last extremity, by the New York ships *Connecticut* (Captain Latham) and the *William H. Wharton* (Captain Gales), laden with cotton, on their passage to Liverpool.

THE GREAT EXHIBITION.

THE past week has been characterised by the great number of excursionists, who have visited the Crystal Palace in large bodies, accompanied by bands of music, in which noise certainly prevailed no harmony. On Monday a building was filled at an early hour. On Tuesday, about 7000 Odd Fellows came up, per excursion train from Southampton; a party of sailor-boys from the *Excellent*, at Portsmouth, and the children of the Gravesend and Milton Sunday-schools.

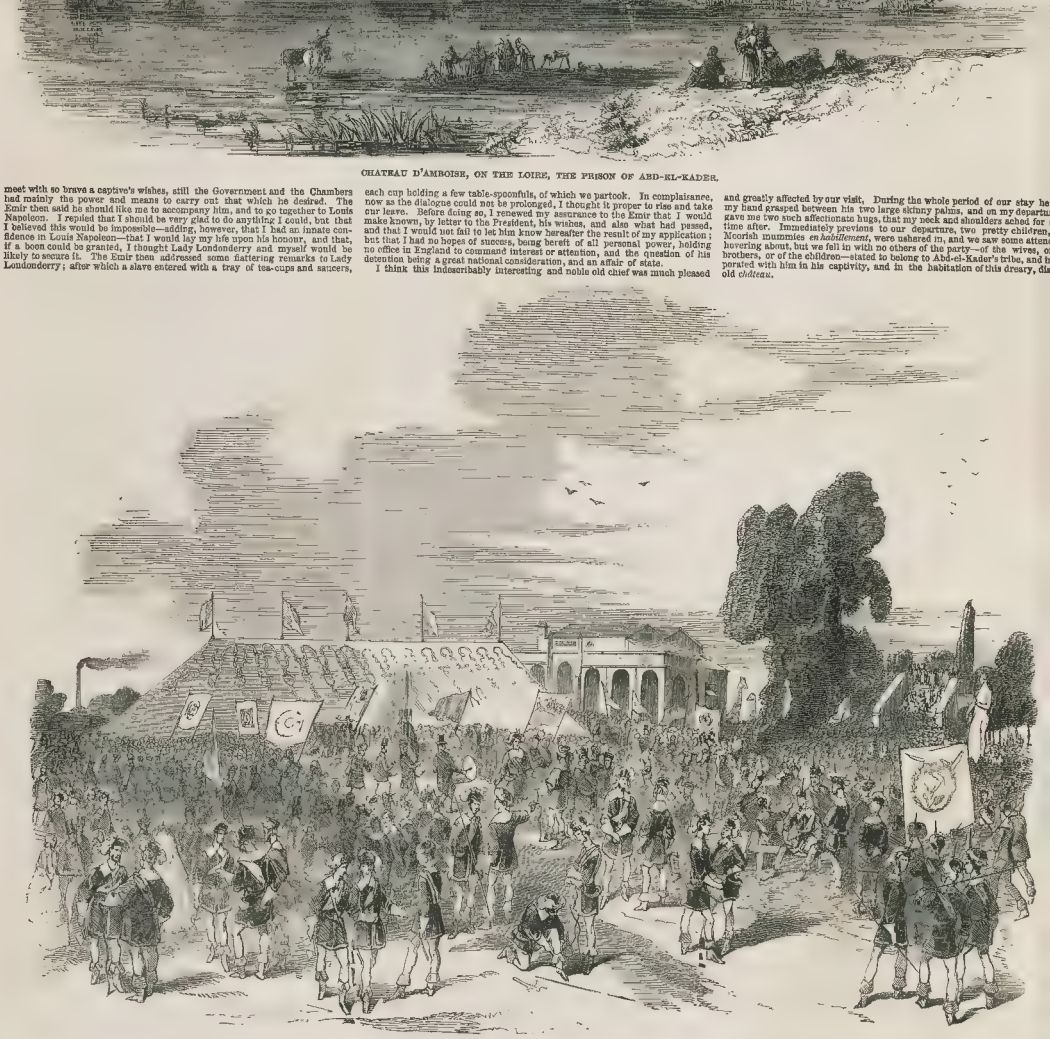
In Russia and Tuscany there have been a few additions during the week. A casket made of service-wood, intended as an emblematic record of the Exhibition, and a representation of England in cotton fabrics thereto, is amongst the articles added to the latter department. It presents in the arabesques which adorn some parts of it, marvellous examples of skill in minute wood-carving.

Her Majesty entered the foreign department on Saturday, prior to her departure for Osborne; and, as usual, her Royal guest accompanied her. On Wednesday morning the illustrious party again visited the same portion of the Exhibition, and minutely examined the productions of the Zollvereign. On Saturday, however, the Queen gave some weeks ago, could have possibly kept the business in a progressive state; and, as it approaches its completion, these difficulties increase, in the knowledge that the exposition of England in relation

CHATEAU D'AMBOISE, ON THE LOIRE, THE PRISON OF ABD-EL-KADER.

meet with so brave a captive's wishes, still the Government and the Chambers had mainly the power and means to carry out that which he desired. The Emir then said he should like me to accompany him, and to go together to Louis Napoleon. I replied that I should be very glad to do anything I could, but that I believed this would be impossible—adding, however, that I had an inmate confidence in Louis Napoleon—that I would lay my life upon his honour, and that, if a boon could be granted, I thought Lady Londonderry and myself would be likely to secure it. The Emir then addressed some flattering remarks to Lady Londonderry; after which a slave entered with a tray of tea-cups and saucers, each cup holding a few table-spoonfuls, of which we partook. In complaisance, now as the dialogue could not be prolonged, I thought it proper to rise and take our leave. Before doing so, I renewed my assurance to the Emir that I would make known, by letter to the President, his wishes, and also what had passed, and that I would not fail to let him know hereafter the result of my application; but that I had no hopes of success, being bereft of all personal power, holding no office in England to command interest or attention, and the question of his detention being a great national consideration, and an affair of state.

I think this indescribably interesting and noble old chief was much pleased and greatly affected by our visit. During the whole period of our stay he my hand grasped between his two large skinny palms, and on my departu gave me two such affectionate hugs, that my neck and shoulders ached for time after. Immediately previous to our departure, two pretty children, Moorish mummies *en habillement*, were ushered in, and we saw some attend hovering about, but we fell in with no others of the party—of the wives, o brothers, or of the children—stated to belong to Abd-el-Kader's tribe, and h porated with him in his captivity, and in the habitation of this dreary, da old *château*.



FETE OF THE ANCIENT ORDER OF FORESTERS, AT THE SURREY ZOOLOGICAL GARDENS, ON MONDAY.—(SEE PRECEDING PAGE.)

THE RECENT FIRE AT MONTAGUE-CLOSE, LONDON-BRIDGE.—(SEE NEXT PAGE.)

HARROW NATIONAL SCHOOLS AND ASHLEY MEMORIAL.

THE foundation-stone of these Schools was laid on Thursday, the 26th ult. (the Harrow speech day), by the Lord Bishop of London, who was surrounded by the Rev. Dr. Vaughan, the Head Master, and the other masters of the Public Grammar School, the Rev. J. W. Cunningham, the vicar of the parish, a large number of the inhabitants of Harrow, and many visitors.

One portion of the building is a memorial of the late Hon. Anthony Francis Henry Ashley, the second son of the present Earl of Shaftesbury, who died at Harrow School, May 31, 1849, distinguished by the beauty of his youthful piety and eminent blamelessness of character. In testimony of such early worth, his masters and schoolfellows determined to erect some monument in the spot where his example had shown most brightly. It was at first intended to place a tablet in the church: but the contributions having reached £600, it was justly felt that a more suitable testimonial might be furnished, by building, with the sum subscribed, a distinct portion of the parochial schools, and connecting it for ever with young Ashley's name.

The Schools just commenced consist of school-rooms for boys and girls, each 41 feet in length by 22 in breadth, with a large class-room, and master's residence. The roofs will be open, all the timbers being stained and exposed to view, with plastering between the rafters. Ventilation has been carefully considered, the arrangements for which, together with the internal fittings, will be very complete.

In addition to nearly £700 subscribed by the inhabitants of Harrow, £300 remains to be collected, which the promoters hope to receive from the known liberality of old Harrovians.

The architects are Messrs. W. G. and C. Habershon, of London.

NATIONAL SCHOOLS AND ASHLEY MEMORIAL, HARROW.

LAUNCH OF THE "AMAZON."

THIS vessel, the largest timber-built steam-ship ever constructed in England, was launched on Saturday from the ship-yard of the Messrs. Green, at Blackwall. The *Amazon* is one of the fleet of new vessel

LAUNCH OF THE WEST INDIAN STEAMER "AMAZON," AT BLACKWALL, ON SATURDAY.

about to be placed by the Royal Mail Steam-Packet Company on the West India service, the steamers at present employed upon that station being found not sufficiently powerful to maintain that degree of speed and regularity which is required by the increased demand for more rapid communication with our West Indian colonies. The *Amazon* is a ship of 2656 tons burden. Her entire length is 300 feet, and her breadth 41 feet. The depth of her hold is 32 feet. The whole period occupied in her construction has been little more than nine months; and in about a year from the time that the keel was laid down, this noble vessel will have been fully completed, and ready to proceed on her first voyage. Her motive force will consist of two engines of 2400 horse-power, which are to be supplied by Messrs. Seaward and Capel.

A large and fashionable company, including several foreigners of distinction, was invited by the directors of the Royal Mail Steam-packet Company to be present on Saturday at the interesting spectacle of the launch, and the river in front of the ship-yard was crowded with small craft, containing numerous visitors from London. Shortly after one o'clock, the signal was given for removing the supports; and after the busy operation of the shipwrights' hammers for a few minutes, the enormous vessel glided with an easy graceful motion into her native element amidst the cheers of the spectators, receiving at the same time from Lady A. Fagot the title of the *Amazon*, according to the usual form. She was immediately taken in tow by a couple of river steamers, and brought to moorings a little above Messrs. Green's yard.

The friends of the Directors of the Company were afterwards received at a hospitable entertainment in the spacious cabins of the *Trafalgar*, which was lying in an adjacent dock.

THE LATE FIRE AT LONDON BRIDGE.

THE Engraving upon the preceding page presents an artistic picture of the conflagration, with some of the striking effects by which such catastrophes are peculiarly characterised. Another Picture, showing the progress in detail, was given in our Journal of last week. We subjoin a few additional particulars.

The flames continued to rage within the ruins on Wednesday evening week, and, up to a late hour on Thursday evening, a quantity of fire continued to exist under the ruins.

In consequence of the great suspicions entertained as to some foul play having taken place with regard to the premises of Messrs. Wigan and Co., one of that firm, supported by Mr. Alderman Humphery, on Wednesday week made a formal request to Mr Payne, City Coroner, stating their wish that he would issue his precept for a jury to inquire into the circumstances, and take place into all the circumstances. To this application Mr. Payne replied that he would most willingly assist the inquiry, but for the reason that the expenses for the inquiries that he had held for a year and a half, in which much useful information had been obtained, and offending parties brought to justice, had been refused to be paid by the Court of Common Council.

Messrs. Wigan then addressed to the Lord Mayor a letter, applying for an inquest to be held. This letter was read to the Court of Common Council, assembled on Thursday, when, after much discussion, the application was ordered to "lie upon the table." The Coroner, however, subsequently consented to dewiate from his former intention, and on Monday held the required investigation, at the Bridge-house Hotel, Southwark.

After several witnesses had been examined, the Coroner addressed the jury, and said that one of the witnesses had given an opinion that the fire was caused by spontaneous combustion, and, speaking hypothetically, that might or might not have been the cause. It had been stated that the rage had been damp, they might have produced this result; but even this suppost ion had no reference to the warehouse D, which appeared to have contained nothing but hops. Mr Braidwood had given his opinion that hops would burn if sufficient heat was applied to them, but how they were fired appeared at present to be a mystery. He thought it was not well to close such an inquiry hastily, but that the best course was to adjourn the inquiry for a certain period; and in the meantime that a reward should be offered by any one who had information in his possession as to how the fire originated; half the amount to be paid on the commitment, and half on the conviction of the offender.

This suggestion was immediately acceded to by the jury, and the inquiry was adjourned.

Mr. Wigan, before the breaking up of the jury, expressed his intention of offering a reward of £500 for the apprehension of the parties by whom the premises had been set on fire.

CALENDAR FOR THE WEEK.

SUNDAY, July 6.—Third Sunday after Trinity.
MONDAY, 7.—St. Thomas à Becket.
TUESDAY, 8.—Duke of Cambridge died, 1850.
WEDNESDAY, 9.—Sun rises 3h. 56m., sets 8h. 14m.
THURSDAY, 10.—London Bridge burnt, 1212; 3000 lives lost.
FRIDAY, 11.—Old St. Peter.
SATURDAY, 12.—Erasmus died, 1536.

TIMES OF HIGH WATER AT LONDON BRIDGE,

FOR THE WEEK ENDING JULY 19, 1851.

MANOR HOUSE, RICKMANSWORTH, HERTS.—The Misses PINEL and Mr. HARRIS, being deeply impressed with the importance and the responsibility of their vocation, in the education of youth, have resolved that the arrangements respecting their classes comprise as far as is practicable the most approved methods of instruction at present in use, with a due and unremitting attention to their religious and moral advancement. Terms may be known on application. Pupils received 24 January, 1851.

FREEMASONRY.—BANQUET to General Sir CHARLES JAMES NAPIER, G.C.B.—The Brethren of the LODGE of RECTITUDE, No. 728, RUGBY, will have the honour of entertaining General Sir CHARLES JAMES NAPIER, G.C.B., &c., late Commander-in-Chief in India, on SUNDAY, the 14th instant, when they will be happy to welcome any members of the craft who will join them in this mark of respect to that highly distinguished Brother. It is requested that applications for tickets may be made to Brother H. B. BINGHAM, W.M., College of the Deaf and Dumb, Rugby, and not later than the 11th instant. The Lodge will open at 2 P.M. Banquet at 4 P.M. Tickets 21s. each. NB The R.W. Brother the Earl Howe, P.G.M. of Warwickshire, has summoned a Provincial Grand Lodge to meet on the occasion. All Brethren are expected to appear in full Masonic clothing.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JULY 5, 1851.

THE cry of "protection to British industry" has, during the present week, been raised on two very singular and very dissimilar occasions. According to Sir Edward Bulwer Lytton, the chairman of a meeting of persons said to be interested in the subject of copyright—among whom we may remark that we were glad to see very few authors—British writers are to be protected by the denial in this country of any right to a foreign author, or the British purchaser of a foreign author's manuscript; and, according to the farmers' friends in the House of Commons, the grower of British chicory is to be protected against the grower of Ceylon and other coffee, by allowing knavish grocers to mix their clear coffee and cheap chicory together, and sell the fraudulent compound at the price of the dearer article. We place both of these questions together, dissimilar as they may appear, not only because they have both been debated during the week, but because they have, in reality, a principle common to them both. Piracy and adulteration are supported by the same mode of argument and by the same false pretence of a regard for the public interest, and by the same species of logic.

And first of the Copyright question. Sir Edward Bulwer Lytton exclaims, that he cannot agree with those who say, "Let this country do what is right, no matter what others may do." On the contrary, to obtain an end which we must confess to be highly desirable—an international copyright, extending throughout all civilised countries—he would, in the interim, commit or sanction a wrong, and would abet piratical English booksellers in preying upon the brains of foreign authors, unless the foreign author should happen to belong to a foreign state which had sanctioned the principle of an international copyright with this country. But in Sir Edward's argument we are at a loss to discover whether he speaks as an author of original books, or as a mere trader in paper and print without reference to authorship. If in the first capacity, we would remark, that, because the Copyright Act of Queen Anne was framed with the object of encouraging men of genius and learning to write books, it does not follow, as Sir Edward Lytton infers, that British authors alone were meant to be encouraged in Britain. As an author himself, Sir Edward Lytton would, we are sure, be one of the least likely of men to dread foreign competition in the book manufacture. If, however, he argue as a bookseller, while we can but regret to see a gentleman of his literary position identifying himself with such a cause, we would ask him to substitute any article of property for the word "book" or "manuscript," and then inquire whether in any honest community a foreigner should not have the same rights as a native? If a foreigner bring here a bale of cotton, or a cargo of tea, or a piece of jewellery, or a watch, and sell it, has not the purchaser a legal right to hold and enjoy such article? Ought there to be any difference—can there be any difference in a moral point of view, if the article to be sold by the foreigner happen to be a manuscript of a book, or a piece of music

intended for publication? British genius does not dread its publication, and needs no protection; but a certain class of English booksellers, affecting to speak in the interest of British authorship, deny the foreigner all right to his literary property in this country; and if any member of his own trade, having a different opinion, purchase the foreigner's book, and publish it at his risk, they coolly pirate it, and assert that the foreigner, having had no right, could not transfer it. Upon this principle, if a foreigner pawned his watch in this country, an English watchmaker might walk into the pawnbroker's office, and make off with the article. And, with all respect for the author of "Paul Clifford," we must say that such a principle is somewhat too much *à la* Clifford, or *à la* Turpin, to suit the notions of any honourable mercantile community. British authorship needs no protection: it will enforce its own right in its own country, and will use all honourable means to induce the United States of American and other countries to sanction the principle of an international copyright; but it will pursue its career in literature as in trade, the right course, notwithstanding all efforts of ignorant or interested parties to persuade it to adopt a contrary course.

The great Chicory question, which boasts the support of the Chancellor of the Exchequer, is quite as simple. The grocers have lately adopted the practice of mixing chicory, worth 3d. or 4d. a pound, with coffee, worth four or five times that sum, and of selling the "half-and-half" as the same price which they would charge for the coffee unmixed. They allege that the mixture is really better than pure coffee, and that the public like it. Perhaps so; and if they would only carry their kindness to the public so far as to sell coffee as coffee, and chicory as chicory, and allow the poor public to mix for themselves, there would be no harm done which could with any justice be laid upon the heads of the grocers. But the grocers persist in clutching the knavish profit on the inferior article; and when the Chancellor of the Exchequer is asked to lend his aid to prevent the fraud by authorising the excise-officers to exercise the same supervision over coffee, as they now do over tea, Sir Charles Wood declines to interfere. His agricultural friends have discovered that one of the best paying crops that can be raised in this country is chicory, and they deprecate all attempts to prevent the fraud of the grocer, lest the consumption of chicory should be diminished, and the British farmer lose a growing market. Sir Charles Wood yields to the soft persuasion, although it is proved that the relative consumption of coffee has largely diminished, to the loss of the revenue. Thus one class of the natives, the chicory growers, are protected, and another class, the knavish grocers, are encouraged in knavery, in order that the foreign article—good coffee—may not find its way to the longing lips of the great bulk of the English people.

The result of the discussion which took place on the subject in the House of Commons is a positive disgrace to us as a people. If the public desire to drink chicory, by all means let them drink it; and we shall rejoice if their predilection for that article should put money into the pockets of the British farmer; but let it be incumbent upon the vendors to vend it as chicory, at the chicory price, and not to palm it off upon the easily-cheated multitude as coffee, at an overcharge of two or three hundred per cent. It is bad enough that such a fraud should be perpetrated; but it is still worse that a man like the Chancellor of the Exchequer should lend all the weight and authority of the Government to support it.

COUNTRY NEWS.

AFFRAY BETWEEN THE MILITARY AND POLICE.

The Liverpool magistrates were engaged on Tuesday in the investigation of a charge of riot, of a very serious character, preferred against twenty-five of the privates of the 91st regiment, at present stationed in that town.

On Saturday evening last, some of the soldiers belonging to the 91st, who were in an intoxicated state, quarrelled with and were rather severely handled by the police. On Sunday evening, the soldiers returned, and the first men they met were maltreated, and the result was, that three of the soldiers were taken into custody, and brought before the magistrates on Monday morning. This seems to have irritated the military, and a body of them succeeded in rescuing their comrades from the cells on Monday night, with the purpose of making reprisals on the civic force for the supposed insult received by them; and some of them were heard to say that the quarrel should not be settled until a policeman's blood had been shed. They met at nine o'clock at Hanover-street, in public-house, in Dale-street, and soon after sallied out into the street. Their first exploit was to attack with their cross-belts police-officer Duggan (419), who was on duty in Dale-street, and they beat him almost to death; they then rushed up Shaw's-brow, making a furious onslaught on every unfortunate policeman who fell in their way. By this time the police had assembled in considerable force, and, attacking in detail the military posters, who had previously detached themselves in small parties, they succeeded effectually in cutting off a junction of the straggling parties; and, although the conflict was kept up with desperate resistance, as each fresh band of soldiers was attacked, and the whole neighbourhood was for nearly two hours kept in a state of the greatest apprehension, captures of more than thirty of the soldiers were effected by the police, who were reinforced by parties of their own body, that were brought by Mr. Superintendent Dowling to the scene of the riot. At length a demand was made at Everton barracks for assistance from the officers of the regiment, who promptly despatched several picquets of thirty men each to aid in quelling the disturbance. Notwithstanding this, however, many of the soldiers were in the barracks, hearing what had occurred, sealed the wall, and proceeded to the rescue of their comrades, about twenty five of whom had by this time been lodged in Rose-hill Bridewell, previous to their being removed to the more secure prison of the borough. Watching, however, the absence of the picquets, who had been engaged in clearing the streets, the scattered soldiers again assembled at Rose-hill just as the van in which their comrades were placed was being driven off, and a renewed conflict ensued, in which the police would beyond doubt have suffered the loss of many of their number, as the soldiers were using their side-arms with horrible impressions, just at the time of the picquets who were recalled and ended the affray. The van was then driven off with great speed, accompanied by a large body of police at double quick time, and the prisoners were ultimately lodged in the main gaol of the town.

Throughout the night (Monday), however, considerable crowds thronged the streets where the affray had been carried on

Upon the application of the commissioners, the men were remanded until the state of the wounded police officers, as well as that of the military at present in the hospital, could be more accurately ascertained.

The soldiers were again brought up on Wednesday; and, after further evidence establishing the charge against those who was taken, they were again remanded until some of the wounded parties can appear.

A petition, very numerously signed by the inhabitants of the town, has been got up, praying for the instant removal of the regiment from Liverpool, it being quite certain that many lives will be lost, and renewed conflicts of frequent occurrence will take place between that regiment and the police, should the former be permitted to remain in their present quarters. The appearance of the soldiers before the magistrates on Tuesday certainly showed that they had met with considerable injury, whatever may be the "set-off" on the other side.

A paper-mill at Manchester, belonging to Messrs. Dickson and Co., was destroyed by fire on Tuesday. The accident is supposed to have arisen from spontaneous combustion.

Rochester Diocesan Female Training Industrial Institution.—The foundation-stone of this institution was laid by the Bishop of Rochester, on Wednesday. The intended building has been designed by Mr. Clarke, of Stratford-place. It is in the Elizabethan or Tudor style of architecture, composed of brick, with Bath stone borders to the doors, windows, &c.; and has a chequered front, similar to the Great Hall in Lincoln's Inn, and the building of Hampton Court Palace. The extreme elevation will be 43 feet; length, 220 feet; and depth, 106 feet. It comprises an infant-school, dining hall, matron's apartments, &c., and will cover an area of 2½ acres. The estimated cost is £9000; towards which the National Society have subscribed £500; and, with the Government grant, the subscriptions amount to £4800. A further sum of £44 12s. 3d. was collected on Wednesday at the church door.

Weighing of Agricultural Produce.—On the 30th ult., a numerous public meeting of 64 more was held at the Castle Inn, Scot-and-yard, Liverpool, at which it was resolved to abandon buying and selling agricultural produce by the long weights, and that 14lb. should in future be considered a stone; that a hundredweight should consist of eight stones, and a ton of 20 cwt.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

The Court has paid a brief visit to Osborne during the past week, chiefly with a view of affording her Majesty's uncle, the King of the Belgians, an opportunity of witnessing the improvements in progress and completed at the Royal marine residence.

Her Majesty and the Prince Consort, with their illustrious relatives, left town on Saturday afternoon, and crossed from Gosport in the *Fairy* Royal yacht, commanded by Lord Adolphus Fitzclarence.

Early on Sunday morning, the Queen and the Prince, with their illustrious guests walked in the grounds and park of Osborne. In the afternoon his Serene Highness Prince Augustus of Coburg arrived at Osborne on a visit to her Majesty and the Prince. His Serene Highness returned to Claremont early on Monday.

Their Royal Highnesses the Duc de Brabant and Comte de Flandres, attended by Col. de Meerkerke and Sir Robert Otway, landed at Portsmouth in the *Fairy* Royal yacht, on Monday, for the purpose of seeing Portsmouth Dockyard.

On Tuesday the Court returned to Buckingham Palace, and in the evening visited the Opera.

On Wednesday the Royal visits to the Great Exhibition were resumed. The Countess de Neuilly, the Duke de Nemours, and the Prince and Princess de Joinville, paid a visit to his Majesty the King of the Belgians, on Wednesday afternoon, at Buckingham Palace. In the evening the Queen had a dinner party, the company at which included his Majesty the King of the Belgians, her Royal Highness the Duchess of Kent, his Royal Highness the Duc de Brabant, his Royal Highness the Comte de Flandres, Highness the Duc de Brabant, his Royal Highness the Comte de Flandres, their Royal Highnesses the Prince and Princess Augustus of Saxe Coburg, his Serene Highness the Prince of Lowenstein, the Earl and Marchioness of Normanby, the Earl of Liverpool, Lady Bloomfield, the Right Hon. Sir Charles Wood, and Lady Mary Wood, the Right Hon. Sir James Graham, Sir Hamilton and Lady Seymour, &c.

On Thursday the King of the Belgians took leave of the Queen and the Prince, on his return to the Continent.

Lord Charles Fitzroy has relieved General Wemyss in the duties of Equerry-in-Waiting to her Majesty; and Lieut.-Colonel Francis Hugh Seymour has relieved Colonel Bouverie in the duties of Equerry-in-Waiting to his Royal Highness Prince Albert.

His Serene Highness the Prince of Leiningen visited and took leave of the members of the Royal family on Wednesday, at their respective residences, on his return to the Continent.

His Excellency the Marquis of Normanby, accompanied by the Marchioness, has arrived in London from Paris, and is staying at the Earl of Mulgrave's mans on in Eaton-place. We understand the noble Marquis contemplates a sojourn of about a fortnight in town.

His Excellency the Earl of Westmorreland (the late British Minister at Berlin) has arrived in town from Hanover, after paying the King a visit *en route* from the Prussian capital

The Earl of Mulgrave has embarked in the *Titania* yacht on a cruise off the Yorkshire coast.

Lord Londesborough has become the purchaser of the fine estate of Escarsdale, in Yorkshire, situated near the the town of Driffield, in Yorkshire, which was sold by auction last week.

The Duchess Dowager of Bedford gave her first juvenile *fête* for the season on Thursday last, at Bedford Lodge, Campden-hill, Kensington. The party was attended by her Royal Highness the Duchess of Gloucester and upwards of 300 of the nobility, &c., with many of its juvenile scions.

CHURCH, UNIVERSITIES, &c.

Preferments and Appointments.—The following appointments and preferments have recently been made: *Deanery Rural:* the Rev. Charles Marine to the Deanery Rural of Lincoln. *Rectories:* the Rev. James Drummond to the rectory of Achurch with Lilford; the Rev. Newton Spicer to the rectory of Byfleet, Surrey; the Hon. and Rev. Mortimer Neville to the consolidated rectories of Heydon and Little Chishall, Essex; the Rev. John Grove to the rectory of Wollaston, Gloucestershire; the Rev. Thomas Boys Ferris to the rectory of Corscombe, Dorset; the Rev. R. Mantell to the rectories of Woolvington and Graffham, Sussex. *Vicarages:* the Rev. J. Carter to the vicarage of Bridekirk, Cumberland; the Rev. George Willcock to the vicarage of West Mersea, Essex; the Rev. David Evans to the vicarage of Aberavon, with Baglan, Glamorganshire.

Testimonials.—The following gentlemen have lately received testimonials of esteem and affection:—The Rev. W. Wright, by his boarders, on resigning the office of principal of Leamington College. The Rev. John his resignation of the office of principal of Leamington College. The Rev. John his resignation of the office of principal of Leamington College. The Rev. John Harvey Knapp, from the congregation of Armley church, Leeds, on his resigning that curacy. The Rev. Theophilus Bennett, of Whittington, Lancashire, from the junior teachers of his Sunday school. The Rev. Charles Frederick Booker, the junior teachers of his Sunday school. The Rev. Charles Frederick Booker, the junior teachers of his Sunday school. The Rev. Charles Frederick Booker, on resigning St. George curacy, Hulme, Lancashire, from the teachers of the Sunday school. The Rev. R. M. Evanson, from the Sunday school teachers, on his resigning the curacy of Christ Church, Accrington, Lancashire. Rev. Charles Hazen Good, from the tract distributors of Boisovar and two of the late candidates for confirmation, on his resigning the curacy of Boisovar, in Switzerland. The Rev. J. H. Kenworthy, of Ackworth, Yorkshire, from his choir boys. The Rev. J. R. Pears, Bath, from some of the inhabitants, and from the Sunday teaching. The Rev. F. Reynolds, of Waterhead, Lancashire, from the Sunday school teachers. The Rev. B. L. Cubitt, late curate of Barkisham, Suffolk, on resigning that curacy. The Rev. C. A. Bellis, on laying the foundation-stone of a new church at Hockerill, Bishop's College.—The *Westmorland Gazette* states that the Bishop of Durham has subscribed £15 towards an Independent chapel in Newcastle-upon-Tyne. The following is a copy of his Lordship's letter transmitting his donation:

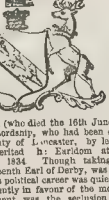
4, Upper Portland-place, June 7.

Sir,—Although with ample means at my disposal, I can scarcely satisfy the demands of my own Church and my own people; yet I have never forgotten that all stands of my own Church and my own people; yet I have never forgotten that all stands of my own Church and my own people; yet I have never forgotten that all Christians are brethren, and that, however we may differ as to the meaning of Scripture Christians are brethren, and that, however we may differ as to the meaning of Scripture in some points of doctrine or discipline, very few Protestants fail to inculcate what is essential in Christianity. I am painfully aware of the spiritual destitution of Newcastle, of its increasing population, and of the pains which are taken to disseminate infidelity and socialism; I cannot, therefore, feel myself justified in resisting your appeal on behalf of a more spacious and commodious place of worship, and especially for a larger establishment of schools in the principles of revealed religion. Towards those joint good purposes, you and the congregation will be pleased to accept the enclosed cheque. I am, Sir, your obedient servant, S. Dunelm.

James Wilson, Esq.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

THE EARL OF DERBY.

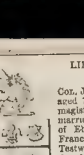


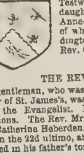
Edward Smith Stanley, thirteenth Earl of Derby, Baron Stanley of Bickerstaffe, and a Baronet, Lord-Lieutenant, Vice-Admiral, and Custos Rotiulorum of the county of Lancaster, and a Knight of the Garter, was the elder son of Edward, the twelfth Earl, and his only son, by his first wife, Elizabeth, only daughter of James 2nd Duke of Hamilton and Brandon. He was born on the 21st April, 1775. His first cousin, Charlotte Margaret, second daughter of the Rev. Geoff rey Hornby, by whom (who died the 16th June, 1817) he had three sons and four daughters, all of whom survive. Lady Stanley, who had been created Baron Stanley, of Bickerstaffe, in the county of Lancaster, by letters-patent dated the 2nd of October, 1832, inherited by Earldom at the decease of his father, the 21st of October, 1834. Though taking no prominent part in public life, Edward, thirteenth Earl of Derby, was a worthy representative of his illustrious house. His political career was quiet and unobtrusive, but his predilections were unmistakingly in favour of the more Liberal side in State affairs. His continual retirement was the seclusion of knowledge and science. He was particularly attached to natural history, and he spared neither pains nor expense in the advancement of his favourite study. He was President of the Linnæan and the Zoological Societies. The Earl's benevolence and hospitality were almost without bounds, and he was very generally and sincerely esteemed and beloved; his demise will be severely felt. His Lordship died at his seat, Knowsley Hall, Lancashire, on the 30th ultimo, in the 77th year of his age. His death-bed was surrounded by his family. He is succeeded in his honours by his eldest and highly distinguished son, Edward Geoffrey, Lord Stanley, who was summoned to the House of Peers in his father's barony in September, 1844, and who is now in the fourteenth year of his parliamentary career. The Earl is in his 52d year, is married to Emma Caroline, second daughter of Lord Skelmersdale, and has issue two sons and a daughter. The elder son, now Lord Stanley, is M.P. for West Cumberland

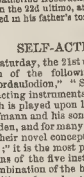
LADY DEANE.

Elizabeth, wife of Sir Thomas Deane, of Dunraven Castle, High Sheriff of Cork, died in Dublin, on the 8th inst., in her 51st year. To all that adorned the Christian character, her Ladyship added the highest intellectual accomplishments: she was well known as a distinguished amateur artist; and, as a practical benefactress to the poor of her district, she will long be remembered and lamented. At the time of the famine in Ireland her exertions were unceasing, and she taught the female poor to earn food by the industry of their own hands. The deep sorrow at her grave of 150 of her crochet workers bore testimony to this fact, as well as to the love of those she had sustained.

Lady Deane was daughter of the late Robert O'Callaghan Newenham, Esq., and grand-daughter of Sir Edward Newenham, of Belcham, co. Dublin.







Lieut.-Col. G. R. P. Jarvis, of Doddington Hall, County Lincoln.

Col. Jarvis, of Doddington Hall, died on the 14th instant, aged 77. He was a Lieutenant-Colonel in the army, and a magistrate and Deputy-Lieutenant for Lincolnshire. He married twice: first, in 1802, Philadelphia, third daughter of Ebenezer Blackwell, Esq.; and, secondly, in 1830, of Frances, sister of the Right Hon. Wm. Sturges-Bourne, of Testwood, Hants. By the former, he leaves, with two daughters, Mary-Ideo, wife of Major Robert Cole; and Anne-Hester, of John Bromhead, Esq., four surviving sons, of whom the eldest, George Knollis Jarvis, Esq., of Doddington Hall, is married to Emily, eldest daughter of the Rev. George Thomas Pretyman, Chancellor of Lincoln.

THE REV. T. GERRARD ANDREWES, M.A.

This gentleman, who was the son of Dr. Andrewes, Dean of Canterbury, and Rector of St. James's, was himself Rector of All Hallows, Bread-street, and St. John the Evangelist. He was also for some time Chaplain to the House of Commons. The Rev. Mr. Andrewes married, on the 10th June, 1819, Martha Catherine Haberden, by whom he leaves three sons and two daughters. He died on the 22d ultimo, at his residence, 8, Sackville-street, Piccadilly, and was interred in his father's tomb at Great Bookham.

SELF-ACTING MUSICAL INSTRUMENTS.

On Saturday, the 21st ult., at St. Martin's Hall, there was a private exhibition of the following new instruments—The "Orchestrion;" the "Chordaulodion;" "Symphonion," and "Trumpet Automaton," four self-acting instruments. There was also exhibited the "Harmonichord," which is played upon like the organ with manuals and the pedals. Herr Kaufmann and his son, the inventors of the above instruments, are from Dresden, and for many years have been unremittingly occupied in perfecting their novel conceptions. Our artists have illustrated the "Orchestrion;" it is the most picturesque in appearance, and most complete in its actions of the five instruments. It will be seen from the Engravings it is a combination of the brass and wood instruments; for every one of those metallic and wooden tubes has an eloquent speaking voice. The front of the lower portion of the case being opened, discovers the percussion instruments, the kettle and military drums, and triangle. The Orchestrion was invented by Herr Kaufmann, jun.; it was five years before he had completed this marvellous mechanical contrivance, as a substitute for a full military orchestra—the tones of flutes, flageolets, clarionets, cornets, bugles, trumpets, bassoons, horns, oboes, trombones, drums, &c., being most successfully imitated. There can be no mistake—all the instruments depicted in our Illustration actually emit sound, and are by no means decorative. How the maker has so ingenously contrived that the cylinders move with such mathematical exactitude, and that the supply of wind (of course, varying for each tube) should be so precisely regulated, is scarcely to be conceived even by the thoroughly so precisely regulated, is scarcely to be conceived even by the thoroughly initiated in matters of mechanics and acoustics. For instance, it is almost miraculous to hear the light and shade of this invisible instrumentation, to mark the just gradations of crescendo, diminuendo, and sforzando, besides the usual fortes and pianos. We never heard anything so perfectly astounding as the *finale* of the "Don Giovanni:" shutting one's eyes, it seemed as if the famed vocal and orchestral forces of Costa were exclaiming at one time, with portentous effect, the three different times going on in "Trema!" In the dance music, the three different times going on in the *finale* were observed with unerring precision, the mechanical agents doing what the living artists will rarely accomplish—keep together. Nothing could be finer than the Coronation March from Meyerbeer's "Prophète." Godfrey's Coldstream band must look to their playing, for the Orchestrion is a formidable rival.

Perhaps the most practical instrument for general purposes is the Harmonichord, deliciously soft and mellow in tone; it is in the form of an upright grand pianoforte, and it is stated that its action arises from the friction of a cylinder against wire strings. For small churches and chapels, and for a chamber organ, the harmonichord is most desirable. Herr Kaufmann and Fraulein Kaufmann played on it in turn with delicacy and skill.

Furstenau's variations on themes from "Il Flauto Magico," of Mozart, on the Symphonion, was another triumph of mechanical skill, containing flutes, piccolo, clarionets, cymbals, and drums, with pianoforte accompaniment: the precision with which the chromatic scale, ascending and descending is attained, would dismay a bandoon or a Rémusat. This Chordaulodion comprises flute and string play.

The Trumpet Automaton is a figure not unlike Mario in the "Puritani," with the instrument at its mouth. It was invented many years ago by Herr Kaufmann, and won the admiration of Carl Maria Von Weber. What is most remarkable and inconceivable in this exceedingly piece of mechanism, is, that it produces double sounds of equal strength and purity, and flourishes in octaves, tierces, quints, &c., are heard. Perhaps this acoustic curiosity may afford some key to Vivier's wonderous horn effects, certain notes accompanying particular chords. If this discovery should be established, that one instrument can do the same with equal perfection as two instruments, it may lead to something, as natural intonation may surely effect what a piece of machinery can do.

We have as yet referred specially to the execution of each instrument, but the greatest marvel was when the Harmonichord, played by Herr Kaufmann, an i the four mechanical instruments, all were heard at one time in a fantasia on our national melodies. This is truly a miracle of mechanism, each instrument is heard as a solo, and the other relieves it at the exact stand; then two go together, and finally all the works are in movement, keeping exact time, and each one having its part to perform. The triumph of the mechanical agents was no special duty to perform. The triumph of the mechanical agents was no further go, and their visit of Herr Kaufmann and his son to this country will no doubt be patronised largely. Their difficulties must have been enormous; first, in the just investigation of sound; and, secondly, in its application by mechanical means. To construct such instruments without models, for they are quite original, the maker must be a musician, a mechanic, a mathematician, and a philosopher.

The first public performance was on Tuesday, the 24th ult., the instruments having been exhibited on the 11th ult. at Buckingham Palace in the presence of her Royal family. On their way before her Majesty, Prince Albert, and the Royal family. On their way to the country, Herr Kaufmann and son gave concerts, with the greatest success, at Leipzick and Hamburg.

There was to have been a second concert at St. Martin's Hall, on the 27th ult., but her Majesty having been graciously pleased to command a second performance, at Buckingham Palace, on the morning of that day, the entertainment was postponed to last Monday, a notice of which will be found under the head of "Music."

Our artists, in addition to the Orchestrion described above, have depicted the execution of the Self-acting Instruments before the Queen and Prince Albert, the King of the Belgians, and the Royal Family, on Friday. The Royal amateurs expressed their high gratification at the quality and ingenuity of the inventions, and complimented Herr Kaufmann and Son on their success.

MONSTER RHODODENDRON.

In the beautiful "American Garden" of the Royal Botanic Society, Regent's-park, is now to be seen a magnificent example of skilful cultivation, viz. the large standard Rhododendron belonging to the collection of Mr. John Waterer, of the American Nursery, Bagshot. This plant, or rather tree, is about forty years old, twelve feet high, and thirty feet in circumference. When in its greatest beauty it is literally covered with delicate rose-coloured blossoms. Foreigners who have seen it, state that, were such an object exhibited in St. Petersburgh, Berlin, or Vienna, it would of itself attract crowds of admirers. The remarkable incident in its history is, that only a few weeks ago it was luxuriating in Mr. Waterer's beautiful grounds at Bagshot, about thirty miles from London; yet it looks as if it had grown without interruption in its present position for several years.

In connexion with the subject of our Illustration, a few words on the "American Plants" exhibited at the Botanic Society's Gardens here may not be out of place. Many persons are under the erroneous impression, that these plants, instead of having been raised and grown in the country in its history is, that only a few weeks ago it was luxuriating in Mr. Waterer's beautiful grounds at Bagshot, about thirty miles from London; yet it looks as if it had grown without interruption in its present position for several years.

In connexion with the subject of our Illustration, a few words on the "American Plants" exhibited at the Botanic Society's Gardens here may not be out of place. Many persons are under the erroneous impression, that these plants, instead of having been raised and grown in the country of Surrey, are a direct importation from our Transatlantic friends; and there are even instances of the exhibitors themselves having been taken for genuine citizens of the great Western Republic. It may, therefore, be desirable to state, for the information of the general reader, that many of the plants of which the exhibition is composed were originally obtained from North America. The greater number of the best varieties of Rhododendron have, however, been raised in this country, through the process of hybridizing, from those species which were first introduced into England from the same quarter. But various countries in Europe have also had a share in enriching our lawns and shrubberies with these showy plants; and many very choice sorts have been raised in English gardens during the last few years. The more conspicuous, besides the Rhododendron, are the Kalmia and Azalea, both for the

HERR KAUFMANN AND SON'S GRAND MUSICAL PERFORMANCE AT BUCKINGHAM PALACE.—(SEE PRECEDING PAGE.)

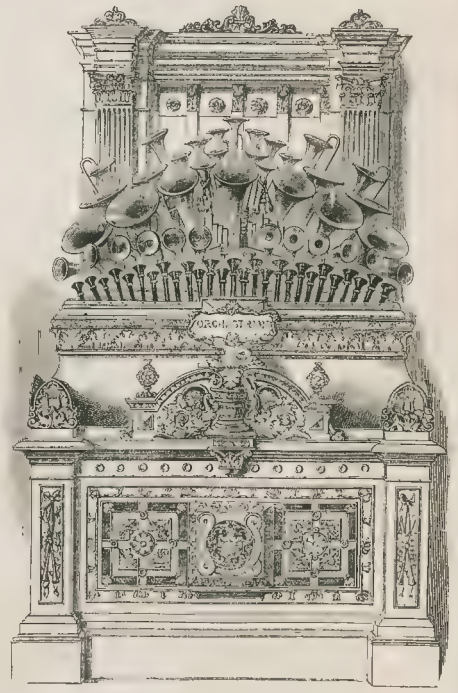
'most part indigenous to different places on the American continent. The Kalmia is a plant of rare beauty; the flowers are much smaller than those of the other two genera named, and also later in opening: though less gorgeous, they are, perhaps, more admired, for their delicate tints and singular form. The hardy Azaleas (are distinguished from those of Indian origin by the term *pontica*. Their more common colours are orange and white, and nothing can well be more effective for a rich and varied display. Some of the white sorts are also deliciously fragrant—a property which the others do not possess.

Several other genera belonging to the same natural order are also represented in the different collections here; but the grand display is essentially formed by the Rhododendrons.

The whole exhibition is under canvas, and occupies about three-quarters of an acre; and the plants, which are arranged in an easy and natural manner, are supplied fresh from the nurseries at Bagshot on every occasion. The exhibitors are Mr. Waterer, Mr. Baker, and Messrs Standish and Noble, whose united collections, about the middle of June, form a display of the most magnificent character.

This exhibition has been visited by her Majesty, Prince Albert, and the King of the Belgians.

MONSTER RHODODENDRON, GROWN AT THE AMERICAN NURSERY, BAGSHOT.—(SEE PRECEDING PAGE.)



THE ORCHESTRION.

GRAND NATIONAL ARCHERY MEETING AT LEAMINGTON.—SHOOTING FOR THE LADIES' PRIZE

GRAND NATIONAL ARCHERY MEETING AT LEAMINGTON.

WITHIN the last seven years the attempts to revive the public taste for archery have been very successful. In 1844, 1845, and 1846, assemblages of archers from various counties took place at York; in 1847, 1848, and 1849, the scene was changed to Derby; and in 1850 to Edinburgh, where it was determined that the next great gathering should take place at Leamington, in compliance with a requisition presented from the county of Warwick to the committee of the National Society.

During the two years since which steps were first taken to secure to Leamington this distinction, the local committee have displayed great energy in the prosecution of their object, as is strikingly shown by their having obtained a list of patrons, containing the names of upwards of one hundred of the nobility and gentry of the county; amongst the most distinguished of whom we find those of his Excellency the Lord Lieutenant of Ireland, the Earl of Aylesford, the Earl and Countess of Bradford, the Earl of Denbigh, the Earl of Buchan, Earl Somers, Countess of Farnham, Lord and Lady Leigh, Viscount and Viscountess Lifford, Viscount Newport, Lord and Lady Somerville, Lord and Lady Guernsey, Lady Emily Harding, Lady Charlotte Palmer, Lady Elizabeth Boultbee, the Hon. Charles and Mrs. Bertie Percy, the Hon. Charles Lennox Butler, Sir William and Lady Hartopp, Lady Mordaunt, Lady Cave Brown Cave, Lady Dubcrly, Sir Gray Skipwith, Bart., Sir Robert Throckmorton, Bart., Sir Theophilus Biddulph, Bart., Sir Robert Peel, Bart., M.P., and Sir Charles Douglas, M.P.

Few places offer so many objects of attraction as Leamington; the facilities by railway from every part of the kingdom—the numerous and various conveniences in hotels, boarding-houses, and private apartments—the beauty of its scenery, with its delightful walks—the interest of its neighbourhood, and easy access to Warwick Castle, Kenilworth Castle, Guy's Cliff, Stratford-on-Avon, Coombe Abbey, Stoneleigh Abbey, Charlecotte, Hampton Lucy, and a host of other places of like interest, all contributing to the amusement of its visitors. To archers there was the additional recommendation that the local committee had succeeded in obtaining a county subscription of nearly £400—being at least three-fourths more than was ever contributed in any previous year from such a source—and thus enabled the committee to announce a list of prizes of about £300 in value, to be distributed in plate or jewellery, and to be selected by the winners. There was also the champion's gold medal, as heretofore; besides four local prizes offered exclusively for residents in the county of Warwick.

The meeting was fixed for Wednesday and Thursday week; and, after a meeting held at the Regent Hotel, on Tuesday evening, where the lots for the target tickets were drawn, it became known that eighteen targets would be pitched for 36 gentlemen, and six for 33 ladies, making in the whole 126 competitors—a number greater than any preceding year had witnessed, except 1846, when the principal prize at York was valued at 100 guineas. There was this year also a considerable increase in the amount of the rewards of honour, compared with those given at Edinburgh, where the total value of the prizes was £341; and a larger number of ladies were to contest for the honour of the field than had ever before been witnessed at such a festival.

The prize jewellery and plate, exhibited at Messrs. Bright's establishment, in the Lower Parade, consisted of solid silver corner dishes, in sets of four, silver tea-kettles, with lamps and stands, and silver tea and coffee services. There were also silver waiters of every pattern, from eight to twenty-four inches in diameter; claret jugs, some entirely silver, and others of Bohemian glass and crystal. To these may be added tankards and cups, chased and engraved with rural, agricultural, and vexophobite subjects; copies of Benvenuto Cellini, &c.; silver caster frames, inkstands, cake-baskets and fruit-dishes, cream-ewers, toast-racks, egg-frames; clocks and candelabra, in or-molu and bronze, &c.

For the Ladies' Prizes were tastefully arranged a rich selection of gold bracelets, set with diamonds, pearls, carbuncles, and ruby garnets; gold and enamelled watches; jewel-caskets in buhl, sacre, and oxidised silver work; tables and jardinieres in buhl, together with an endless variety of brooches.

"The Ornamental Wooden Spoon" was also shown at this establishment. The stem of the spoon is a clown's figure, with fool's cap and bells, terminating at the bowl, which is formed of the body of a goose; the head of the goose is pierced down by an arrow, and forms the centre of the stem. The clown is decorated with a medal engraved "Grand National Archery Meeting, 1851."

The arrival of visitors commenced on Tuesday evening, when the principal hotels received archers and other visitants from Edinburgh, Glasgow, and many parts of Scotland; from Ireland and Wales; from London, Yorkshire, Durham, Lancashire, Kent, Devon, Norfolk, Berkshire, Sussex, Derbyshire, Nottinghamshire, Oxfordshire, Staffordshire, Bucks, Northamptonshire, and other provinces, whose names included some of the most expert and influential bowmen of the day. Their numbers were still further augmented throughout the following day, when the special trains from different parts brought into Leamington several thousand persons.

FIRST DAY'S SHOOTING.

The spot selected for the long-expected fête was Messrs. Parr and Wisden's cricket-ground, comprising an area of eight acres. Around a spacious inner inclosure for the archers were ranged, north and south, eighteen targets for gentlemen and six for ladies; and to this inclosed space the subscribers to the meeting were admitted by ticket. The remainder of the ground was so arranged that the spectators obtained a very excellent view of the whole of the shooting. On the east side, to which admission was obtained at a very moderate price, were erected three tents, in front of which were hoisted the Royal standard and union-jack. There were, also, various other tents, and the German band enlivened the scene by their performance.

About twelve o'clock the bugle signalled the gentlemen to their targets, and the shooting of six dozen arrows at 100 yards commenced; one of the Honorary Secretaries occupying a place at each of the extreme targets, as leader. Henry Peckitt, Esq., of the Thirsk Bowmen, officiated as judge.

The weather was most propitious. At first, the wind was considered unfavourable to the well-directed arrow; but, as the day progressed, some close shooting ensued, and many feats of skill and dexterity were performed, especially at target 18, between the champion, Mr. Ford, with Mr. W. Peters, and Mr. C. Garnett (Royal Toxopholites), Mr. Muir (Salisbury Archers), and Mr. A. F. Moore (West Norfolk Bowmen), all distinguished archers.

About two o'clock the shooting of the first six dozen arrows at one hundred yards having been completed, luncheon was served. At the conclusion of the collation, the archers re-assembled to the targets, the ladies commencing at sixty and the gentlemen at eighty yards.

The shooting by the ladies, of four dozen arrows at 60 yards, was succeeded by two dozen at 50 yards, and each was pronounced by the best judges to be of a superior description.

The sport terminated shortly before six o'clock. The shooting of the gentlemen, taken as a whole, was of a very excellent character. Several very central hits were made at 100, 80, and 60 yards.

In the evening there was a grand display of fireworks by Darby, in the Jephson Gardens.

SECOND DAY.

The weather on Monday was again favourable. As soon as the gentlemen had concluded the discharge of their six dozen arrows at 100 yards, and luncheon had been served, the usual meeting of Archers was held in the Visitors' Tent, to make arrangements for the ensuing year; and the motion, "That their meeting be held in Leamington next year," was carried by acclamation.

After some resolutions had been passed complimentary to the gentlemen who had conducted the business of the meeting, the shooting was resumed by the gentlemen at eighty and sixty yards, and by the ladies at fifty and sixty yards. The graceful style in which the ladies discharged their arrows, and the excellent manner in which they made their "hits," rendered their shooting throughout the day much superior to that of the gentlemen.

In the afternoon, the band of the 4th, King's Own Regiment, played several pieces. The shooting did not terminate till near six o'clock.

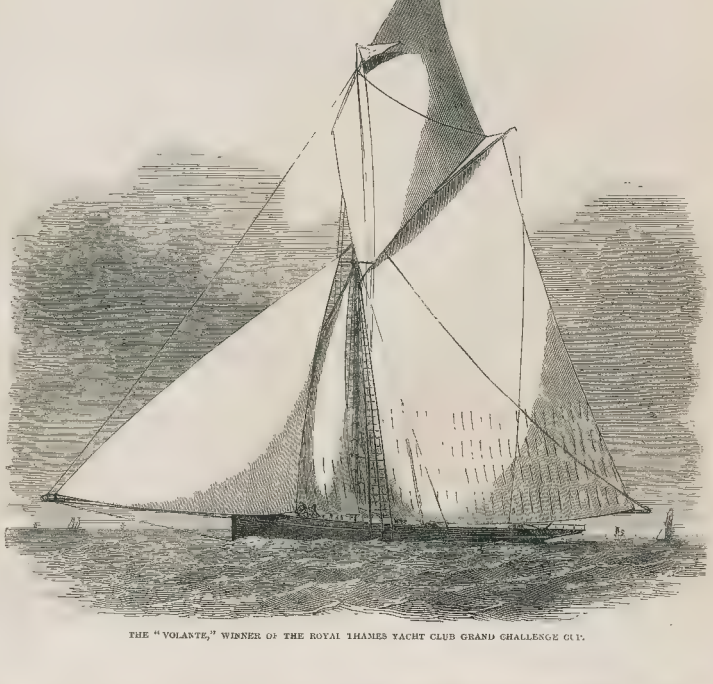
In the evening there was a Grand Dress Ball at the Royal Assembly-Rooms, which was attended by about 300 persons, among whom were many of the most distinguished county families, and some of the leading competitors in the archery amusements of the National meeting.

The prizes were declared in the ball-room, about two o'clock, by Mr. Luard, hon. secretary.

The principal prizes for ladies were gained as follow:—25l., Miss Villers, Worcestershire Archers. 20l., Miss Thursfield, Stour Vale Archers. 15l., Miss Harding, Warwickshire. 10l., Miss Pyal, Worcestershire Archers; 8l., Mrs W Miller, Oxfordshire; 8l., Miss F Palmer, Warwickshire. Gentlemen's Prizes:—45l., Mr M A Ford, Royal Toxopholite Society; 40l., Mr Bramhall, West Norfolk Bowmen; 31l. 10s., Mr Heath, Fraternity of St George; 30l., Mr P Muir, Salisbury (Edinburgh) Archers. 21l., Mr Henry Garnett, Lichfield Archers. 20l., Mr W Peters, Royal Toxopholite Society; 17l. 7s., Mr H Steward, York Archers; 17l., Mr Holland, Pickington Archers; 15l. 10s. Mr Heath, Jun.; 15l., Mr Hillyer, Cheetham hill Archers; 15l. 1os., Mr Hutchens, Camden Archers; 15l., Mr Wills Queen's Park (Brighton) Archers; 12l., Major Nixon, 3l., Major Clowes Worcestershire Archers; 10l., Mr A F Moore, West Norfolk Bowmen; 10l., Mr Bedford, Woodmen of Arden; 10l., Mr Davison, Worcestershire Archers; 10l., Mr H Clark Salisbury Archers; 10l., Mr W W Hargreve, York Archers; 10l., Mr Graham More, Salisbury Archers. An ornamental wooden spoon for the greatest number of whites, to Mr G Giller, Cheetham-hill Archers. Local Prizes:—12l., Mr Garnett, woodman of Arden; 8l., Mr C Williamson, Neville's-cross Archers. The Champion's Gold Medal is still retained by Mr H A Ford.

ROYAL THAMES YACHT CLUB.

The race for the Grand Challenge Cup on Wednesday (last week) created, as usual, considerable interest among yachtmen, and the extreme fineness of the weather rendered the day's trip most pleasurable to visitors, a vast number of whom were present. The *Ruby*, chartered by the club for the occasion, was thronged with a fashionable assemblage; besides which, the Marquis of Anglesey's *Pearl*, with her noble owner on board, to whom the customary honour



THE "VOLANTE," WINNER OF THE ROYAL THAMES YACHT CLUB GRAND CHALLENGE CUP.

were done by the club, and duly responded to, the *Nancy Dawson*, the *Jno. Paragon*, *Fleur de lis*, *Romulus*, *Cynthia*, *Frolic*, and other celebrated yachts, accompanied the race.

The following are found at their moorings at Erith to sail to the Nore Light and back—half a minute per ton being allowed by the larger to the smaller craft:—

Yacht.	Tons	Port.	Owner's Name.	Flag.
Scud	75	Cowes	Mr R Bell, jun.	Blue, diagonal red cross
Heroine	34	Cowes	Mr R Stoddart, sen.	Red and white stripes
Cygnet	30	Southampton	Mr H Lambton	Blue pennant, with a head yellow
Medusa	80	London	Lord Londesborough	Blue pierced white, rn: Maltese cross
Volante	30	London	Mr J L Craigie	White flag

The qualifications of the first four of these are well known. The *Volante* is what in racing phraseology is termed a "dark boat." Her spirited owner, Mr. Craigie, within the last six weeks availed himself of the services of Mr. Harvey, of Ipswich, a producer unknown, save by the praise of the experienced yachtmen, and the *Volante*, the offspring of his labours, on this day made her *début*. That she is extremely fast in a light wind, both in running and beating, the result clearly shows.

The start took place at 11h. 59m. 32s., there being a light wind from W N W. As the wind was right abaft immediately they swung, there was but little or no advantage in the starters. All carried away in the same moment, and, although the usual alacrity was displayed in setting their canvas on all hands, the *Secret* was a trifle quicker than the others, and, consequently, led out a trifle in advance. The others were all in a cluster, but we did not get well under weigh the *Volante* began to look very lively, as also did the *Cygnet*, both of which displaced the *Secret*, the *Heroine* being astern of all. At Purfleet, the *Volante*, *Mosquito*, and *Secret* literally ran abreast of each other on the Kent side, when the *Heroine*, bringing down a nice light breeze with her, added her presence to the *tableau*. In a few minutes the *Volante* began to steal away, and on reaching Gravesend Reach showed a good lead, which she retained all the way down, the *Heroine* running into a second place, the others astern not being quite so well favoured. They rounded the Nore Light in the following order:—

	H.	M.	S.
Volante	2	21	24
Heroine	2	24	30
Mosquito	3	19	25
Secret	3	20	0
Cygnet	3	32	21

The boats turned into the slack as the tide was still ebbing, and in the first or second short-board on the Kentish side the *Mosquito* went to leeward of the *Heroine*, and took the second place. The *Volante* shifted her topsail with a smaller one, and pressed to her quad. In the third board, after rounding, the *Secret* went by the *Heroine* to windward, and the *Cygnet* came up to the latter, and challenged her. Some very smart sailing followed, which elicited much praise. The *Cygnet* passed the *Heroine* to leeward, and then, with a front of only a few yards, we observed, the *Heroine* unsuccessfully followed suit, as a tide-waiter would otherwise, in all probability, have resulted, and the *Heroine* still kept the windward position; but, after a few more minutes of very interesting work, made a long board to try her fortune with "the breeze," and upon again nearing the shore, where she had left the others, found herself astern. The wind in coming up so died off as to read the match very much towards the finish. The *Volante* retained her lead throughout, although menaced by the "time scale." They came in thus:—

	H.	M.	S.
Volante (winner)	9	31	0
Cygnet	10	9	17
Mosquito	10	9	57

Immediately after the conclusion of the race the steamers returned to London.

THE THEATRES.

HER MAJESTY'S.

Bellini's "Norma" was performed, for the fifth time, on Saturday night, followed by the second representation of the selections from Gnecco's "Prova d'un Opera Seria," Mdlle. Ferraris and Marie Taglioni were the stars of the ballet.

The eighth performance of Auber's grand opera, "Il Prodigo," with its powerful cast, and magnificent *mise en scène*, on Tuesday night, by special desire, filled the house with Royalty, rank, and fashion Her Majesty and Prince Albert, who arrived from Osborne during the day, were present, accompanied by the King of the Belgians, and his sons the Duc de Brabant and the Comte de Flandres. The Duchess of Kent, accompanied by Count Otho and Count Rodolph de Stolberg, and the Duke of Cambridge, also visited the theatre. Madame Sontag and Madame Ugalde, Signori Gardoni and Coletti, and M. Massol, with the extensive pantomime and elegant dancing of Mdlle. Rosati, formed a fine ensemble for this beautiful work.

Owing to the necessity of the long rehearsal on Wednesday, for Thalberg's new opera, the *soirée extraordinaire* did not take place, and last night the announced performance was given up, on account of the extensive preparations for her Majesty's State visit, this evening.

On Thursday night was produced the *sixth* novelty of the present unparalleled season of activity by the management, namely, "*Florinda*; or, the Moors in Spain," the music composed by the renowned pianist, Sigismund Thalberg, and the libretto written by the famed Scribe; Giannone, the Italian poet, having supplied the sweet Tuscan language. Mr. Charles Marshall has also exhibits some beautiful scenery; and the discriminating taste and judgment of Mr. A. Harris have been admirably exercised in the action of the opera and in the processione and groupings. The following are the distinguished characters which Mr. Harris was by power and strength:—*Count Julian* (Governor of Ceuta), Sig. Lablache; *Florinda* (his daughter), Mdlle. Sofie Cruvelli; *Rodrigo* (King of the Goths), Sig. Calzolari; *Teodomiro* (his page), Mdlle. Marietta Piccolomini first appearance in England on this stage); *Favilla* (an of Count Julian), Mr. Sims Reeves; *Munuzza* (Chief of the Moors), Sig. Coletti.

The opening scene is an encampment of Moors under the walls of Ceuta. The sentinels announce the approach of Moors, before whom is brought a warrior who declares himself to be *Ben Amet*, chief of the Abencerrages. *Munuzza* avows his projects for the subjugation of Spain, and bloody plan to acquire Ceuta, during a three days' truce with *Count Julian*, its governor. After *Munuzza's* exit, we learn that the unko wn is *Rodrigo*, disguised as *Ben Amet*, whom he has slain. The page *Teodomiro* accompanies the King, who has seen a lady from a mountain fortress. The temperate character of *Munuzza* is about to commence; *Count Julian* sends his son, *Favilla*, to the military festival *Rodrigo* recognises in her the lady he has saved; and her brother is displeased at the notice of her lifting an Arab warrior. A quintet of mingled emotions, cleverly constructed, ensues. The declaration of *Munuzza*, that *Ben Amet*, the destroyer of the Christians, is present, terrifies *Florinda*; and a warm altercation takes place between her brother and *Rodrigo*, the assumed Arab, forming the subject of the finale; a march to the tourneyconcluding the first act.

The second act begins with a chorus of nuns in the convent of St. Irene, to which *Favorita* has retired, on the discovery that her affections are placed on one of the Mohammedan faith. Her father, in a duo, vainly strives to change her resolution, but applauds her lofty purpose. *Florinda* has a grand *scena*, which is relieved by the sudden entrance of *Rodrigo*, who is resolved to carry her off. When he states that he is a Christian, she declares her love for him at once; but when he hints that there is a fatal obstacle to prevent their marriage, she bursts forth into exclamations of contempt and abhorrence. During the stormy conference, the brethren and nuns enter and anathematize the infidel intruder, and a finale of imposing effect ends the act, *Rodrigo* carrying the Castilian maiden despite of all opposition.

The third act opens in the chamber of *Count Julian*, who is in deep affliction at his daughter's abduction. *Munuzza* has an interview with the Governor of Andalusia and the African possessions of the Goths The Chief of the Moors places in *Julian's* hands a letter from the *King*, appointing him successor to the government of Andalusia; but the Count refuses to join *Munuzza*, although shocked at his Monarch's ingratitude. *Favila* announces *Rodrigo's* arrival at Ceuta; but during the heroic and loyal appeal to the son of Goths, but the Moors are at the gates of Ceuta, and *Julian's* treason is irreparable. The concerted piece is here again replete with the conflicting emotions of the principals, the rescue of *Florinda*, and the discovery of his subject's treason. *Florinda's* and *Favilla's* repudiation of their father's crime. *Rodrigo* rushes to the conflict, followed by *Count Julian*, and *Florinda* describes, from a loop-hole, the deadly struggle between the Moors and Christians, the former led by *Munuzza*. The brother and sister sing a prayer for the victory of the cross over the crescent; but the battle is renewed, and she sees the Moor h fall, to rescue whom *Favilla* resolves to perish. *Munuzza* enters in triumph with *Count Julian*, who sees his son die, and in an agony of shame and desperation falls on the lifeless body, having rejected the presents of the Moors for delivering the gates of Spain. Whilst the Moors chaunt their victory, *Rodrigo* and *Florinda* escape in the background, and the curtain descends.

Thalberg's composition must be heard more than once to appreciate its attributes. Our present impression is, that he shines more in concerted pieces than in single airs, that he has higher skill to construct dramatic and massive situations than to describe individual emotion. As might have been anticipated, the orchestration is that of a thorough master; he has studied the peculiar characteristics of each instrument carefully. To combine large orchestral masses in one whole can only be acquired by a long experience. He has studied to invest the music with a *couleur locale*; but in doing this he has, perhaps, been at times monotonous, on account of the constant use of the minor key: the national melodies of the Moors are melancholy in their imagery.

The overture was encored: it has three movements, and is more symphonic than dramatic in form. The oboe is much employed, as indeed throughout the opera. The quartett in the first act, sung by the sisters Cruvelli, Calzolari, Reeves, and Coletti; the duettino in the second act, "O luce," a charming composition, sung by Mdlle Sofie Cruvelli and Calzolari; the aria, in the third act, the appeal to arms, vigorously rendered by Mr. Sims Reeves; and the quartett, in the last act sung by Mdlle. S Cruvelli, Calzolari, Sims Reeves, and Lablache, were the encores. Lablache's *Count Julian* is one of his finest creations; it was remarkably grand, dignified, and touching. His air "Ah! ciel! ciel!" was exhibitedly sung; and his share of the quintett in the finale of the fourth act was wonderfully delivered. Mdlle. Sofie Cruvelli's *Florinda* has much merit; but it is more a bold sketch, at present, than a finished picture. Her attitude in the recognition of *Rodrigo* in the convent scene, was her best point, and was deservedly applauded. Coletti, Calzolari, and Sims Reeves exerted themselves successfully. Her Majesty and Prince Albert were present, and applauded throughout when recalled at the end of the third act. The composer was again led forward at the end of the opera by his father-in-law, Lablache, and was much cheered. Her Majesty has commanded "Florinda" for this evening's State visit.

ROYAL ITALIAN OPERA.

Bellini's "Norma" was represented for the third time on Saturday night, with Grisi's sublime impersonation of the *Priestess*, Tamberlik's *Pollio*, and Formes's *Oroveso*. Mdlle. Marai made her *début* in the part of *Adalgisa*; but she proved to be such a thorough novice, and so perfectly inadequate to fulfil the part, that it is quite useless to dwell on the failure, for such it was. A good *comprimario* and efficient chorus are two absolute wants at this establishment. the three *artistes* engaged for these duties not being such as the subscribers have a right to expect. The giving of one act of Beethoven's "Fidelio" after "Norma" was a great mistake. Even in certain works, we do it is utter profanation to meddle with in the way of excision; and the "Fidelio" and "Don Giovanni" are of this class. Beethoven has, unfortunately, only left one opera, and it should not be treated by a Direction with profound respect, and should be presented in its entirety or not at all. It is an act of positive vandalism, in the worst taste, suggested by the most mercenary spirit. that could think for a moment of rendering a single act of "Fidelio" and this damning the unity of the musical ideas so wonderfully conceived by its immortal writer.

On Tuesday night, Meyerbeer's "Prophète," adjourned through the illness of Mario, was presented for the second time. The tenor is not yet himself, and was certainly not in a condition to do justice to the character of *Jean of Leyden*. The text was twisted, turned, and transformed to suit the exigencies of the singer's lack of physical power, and the wonderful music was mutilated and disfigured. *Fidès*, as still as perfect as ever in the hands of the gifted child of genius, Madame Viardot. Tuis great *artiste*—in every phasis of the drama, in every bar of the music indicated that her great musical gifts and vocal attainments, surveyed as a whole, are unrivalled on the lyric stage. Nothing that the oldest opera frequenter may recollect, can surpass in sublimity her *Fidès*. It is altogether matchless in conception and in wondrous execution: from the earliest arrival of *Fidès* on the stage, full of maternal joy at the approaching union of her son, *Jean of Leyden*, with *Bertha*, down to the agonising climax of the last scene, Viardot fixes the attention and secures the sympathies of her auditory. Whether she be in more or less voice, she never fails to excite her hearers to an extraordinary degree: nothing but exalted genius could accomplish such thrilling effects, for Viardot, physically, has everything against her. Youth we cannot boast of personal attractions, nor of a naturally fine organ, should indeed be endowed with the divine spark within her to cause the most exciting emotions. Her style is more formed for callowed every eye and ear amusement, of watching her statuesque attitudes, nor the ear fatigued by listening to those soul-stirring tones, in which the trials and griefs of the lofty-minded mother of the false prophet are depicted. Her acting and singing in the coronation scene are the triumph of dramatic and vocal art. No description can render adequate justice to the points of beauty in this act—every look, tone, and gesture is followed with breathless attention, the audience fear to interrupt some exquisite phrase; and it is only when the curtain falls that the partial enthusiasm of the house breaks forth with a vehemence of welcome at the vocal and histrionic display of the most consummate artiste of the period.

The choral and orchestral execution deserves every eulogium, under Costa's skilful direction; but a few more supernumeraries in the coronation act, and better dancers in the skating scene, would be desirable.

On Thursday night, Meyerbeer's "Huguenots" was repeated, for the sixth time, a novelty in which was the return of Tamburini in *St. Bris*, a character which he represents with his accustomed power. Grisi's scene of the blessing of the daggers, in his hands, becomes doubly interesting.

Her Majesty's State visit will take place next Thursday, on which occasion Meyerbeer's "Il Pianto Magico" will be produced, with Grisi, Castellan, and Mdlle. Zerr, Mario, Stigelli, Tagliafico, Ronconi, and Formès, in the chief characters.

OLYMPIC

"The Fire-Eater" is the name of Mr. Selby's new farce produced at this theatre on Monday: the hero, a certain one *Jeremiah Goxley* (Mr. Compton), who entertains a fine hatred against the Roundheads, and by enlisting with the Royalists put his courage to the test. He is forewarned by his intended fatherin-law that the experiment will fail, but he has not any fear of such a result. Terrified for a while on finding himself in battle, but the natural want of heroism at last assumes its proper ludicrous shape. The farce was successful.

THE GUILD OF LITERATURE AND ART.

The third performance, at the Hanover-square Rooms, of Sir Edward Bulwer Lytton's amateur play took place on Wednesday, before a numerous and distinguished company. The characters now sit easily on their different representatives, and the scenery has become the source of general admiration. Not an unimportant part of the performance is the excellence of the orchestra. The farce, by Messrs. Dickens and Mark Lemon, of "Mr. Nightingale's Diary," improves on acquaintance. The two authors enact the heroes for this clever little piece has two—and rival in fun Mr. Maclaws and Mr. Wrighi.

MUSIC.

CONCERT AT HER MAJESTY'S THEATRE.

The second and last grand morning concert took place on Monday. The house was very well attended; and the programme, put being overcrowded, as on the first occasion, afforded much more satisfaction. The overtures were Beethoven's "Egmont" and "Prometheus," and Weber's "Ruler of the Spirits," conducted by Balfe. Sivori was the solo instrumentalist. He played two of Paganini's pieces—one exemplifying "perpetual motion," and the other "The Witches' Dance." Both were singularly well executed.

The vocal gleanings were not distinguished by much novelty, each singer selecting the piece best calculate t for individual display. Mdme. Sontag, as usual, carried off the honours. She sang a piquant bolero by Becczi, the ballad of "Home, sweet home" (re-demanded), and Haydn's "On mighty pens." Mdlle. Dupeez, Mdme Flo santini, Mdme. Guiliani, Mdlle. Clayton, Mdlle. Ida Bertrand, and Mdme. Ugalde; signori Gardoni, Belletti, Coletti, the two Lablaches, and Mr. Sims Reeves, were the other vocalists. Mr. Reeves was encored in Purcell's "Come if you dare," which he sings with much animation; and the Lablaches had to repeat the last movement of the duet by Rossini. Signor Ugalde's brilliant vo alisation in Masset's bolero, "La Chanteuse voilée," was also greeted and applauded. The sisters Cruvelli were announced in the bills to sing in certain pieces, but did not appear.

THE MUSICAL UNION.

It is highly creditable to the artistic feeling of Viennatemps, that he has come to this country, at an absolute pecuniary loss, only for the sake of keeping his word with Mr. Ella, the director of the Musical Union. The eminent violin ist, now a resident of St Petersburg, being permanently attracted to the Russian court. Having received a command to play before the royal family, in Paris, and other great towns, his playing created a prodigious sensation; his magnificent tone and thorough mastery of all difficulties being unsurpassed. To the grand elements of a violinist—science and breadth of style—he possessed by very many in an unrivalled degree. He had the first violin part in Haydn's Quartet in G, No. 81, and in Beethoven's quintett in C, Op. 29, in which Mr. Hill was the second violin, Hill and Webb violas, and Piatti violoncello. Mr. Vieuxtemps also executed one of his own works, "Souvenir du Bosphore." It was in the quintet of Beethoven that Vieuxtemps' grandeur of style was most apparent—nothing could be finer than the delicacy of the final movement, descriptive of a storm. The sensation he created was immense; his mechanism in the fanciful solo, which in France was always enthusiastically received, was faultless; and the *tours de force*, as novel as they were elegant, were vehemently applauded by the aristocratic amateurs. Haïde's reading of the sonata was also a rare treat.

MUSICAL EVENTS.

In our notice of the eighth Philharmonic Concert, in last week's Number, there was an accidental omission of a passage, which had the effect of our appearing very unjust towards a young and highly-accomplished pianist, Herr Pauer, from Vienna, who made his appearance on that occasion. We, however, did ample justice to Herr Pauer for his most fly rendering of Hummel's concerto in A minor, only with the drawback of dragging the measure at times. He was immensely applauded by the audience; and, as he left town on the Wednesday following the concert, for Frankfort, where he is about to produce a new opera, we are anxious to make this spontaneous *encomio* to a gifted artist, and not to allow it to be supposed that such an honourable *début* as that of Herr Pauer at a Philharmonic Concert should be passed over by us in silence.

M. Billetta, an Italian composer of much merit, gave a *matinée musicale*, last Saturday, at the Queen Anne-street Rooms. Miss Catherine Hayes sang exquisitely a ballad, "Weep, weep, willow wreep." Miss Dolby rendered a song. "Past hours with thee," most artistically; Mdlle. Graumann warbled a barcarola, "Vola, vola," and sang "The Shepherdess of the Alps;" the Misses Birch gave a duo, "O, come gli è bello;" Mdlle. Graumann, Miss Dolby, and Herr Stibulini a terzetto, "O come è dolce;" and Miss C Hay s, Miss Bassano, Herr Stiteilli, and Herr Stockhausen sang a quartett, "I Poveretti," all composed by Billetta: Reichart, Gardoni, Calkatta, and Bemberini, jun., were the other Billetta: Reichart, Gardoni, Calkatta, and Bemberini, jun., were the other Soloists. Regondi, Pinsuti, Paoli, Germani Taylor, and Miss Goddard the solo instrumentalists; Alary, Piloti, Pinsuti, and Billetta were the accompanyists.

Mr. John Parry presented his "Notes" last Monday at the Hanover Square Rooms, to a numerous and fashionable audience, entertainment, "Our Village Poetry," at Sadler's Wells Theatre, on the same evening.

Herr Kaufmann and Son, assisted by Mdlle. Kaufmann, gave their second concert at the Beethoven Rooms, last Monday night. Amongst the pieces on their newly-invented self-acting instruments that had not been heard before, were the "Mesanello" overture of Auber, on the symphonium; a scena from Donizetti's "Lucrezia Borgia," on the harmoni-ord and chordaulion; Meyerbeer's glorious march from the "Prophète," and Reissiger's march, "Rauh der Heimat," and Mendelssohn's Wedding March, on the orchestrion; Meyerbeer's "Huguenots" overture, on the harmoni-ord and chordaulion, and symphonion. The repertoire is rich and varied, and the combinations of instruments are inexhaustible

Mr. Bridge's third and last *matinée* of classical pianoforte and vocal music was given at the Hanover Rooms last Monday. He played Hummel's Sonata in F minor, Op 20, and other pieces by Mendelssohn, Hiller, S. Bennett, E. Loder, Chopin, Billet, and Thalberg. The vocalists were Madame Macfarren and Herr Reichardt.

Miss Anna Pelzer, pianiste and concertanist, had a *matinée musicale*, at the Queen Anne-street Rooms, last Monday, assisted by Mr. Cudlipp (the gentlemanlike). Herr Ernst (violin), Herr Hausmann, and Mr. Withers (violoncello). M. Szekeley (piano), Remenyi (violin); Misses Lanza and Fyne vocalists, with Herr Schmidt as accompanyist.

Master Alexander Ramsbergye, the clever violinist, had an evening concert on Thursday last, at the Queen Anne-street Rooms, with the aid of Cittadini (piano), Mr. Withers (violoncello), Schmidt (accompanyist). Miss Dolby, Mdlle. Johannsen, Mrs. A. Newton, Signor Marchesi, and Mr. B Richardson.

Messrs. Land and E. Blagrove held their third quartet meeting on Thursday morning, at the Mortimer-street Rooms, aided by Messrs. W. S. Bennett, C. Severn, Lazarus, Horton, C. Harper, Waelsig, Clementi, Pratten, Horncastle, and Mrs. Anderson.

The Cecilian Society, on Thursday, at Albion Hall, performed Handel's "Saul," under the direction of Mr. Shoubridge, with Mr. J. G. Boardman organist.

Ribas, the clever flautist, had a concert on Friday, at the Queen Anne-street Rooms.

Such has been the deserved success of the novel musical entertainment at Willis's Rooms, of giving a programme exclusively filled with English Glees and Madrigals, by a distinguished body of executants, that a fresh series began on Wednesday afternoon at the same locality, and will be continued every succeeding Wednesday, until further notice, under Mr. Pearsall's able direction. The singers are Lockey, Hobbs, Land, Francis, and Phillips. We strongly recommend a hearing of this unequalled glee party, as a great musical treat.

The Sacred Harmonic Society, at Exeter Hall, in the performance of the great oratorios, under Costa's direction, have had enormous audiences ever since the opening of the Exhibition. Mendelssohn's "Elijah" was repeated last night, with Miss Catherine Hayes, Miss Eliza Birch, Miss Dolby, Miss Williams, Mr. Sims Reeves, and Herr Formès as chief vocalists.

This morning will be the fourth and last concert of the Royal Academy of Music, and Miss Kate Loder's concert. Next Monday, Mdlle. E. Krinitz, the pianist, will have a *matinée*, and Madame Sala a concert. The last meeting of the Musical Union will be on Tuesday. On Wednesday, in Exeter Hall, the

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

The Berlin Post-Office, contrary to the assurances in a communication addressed some days back to the British legation, continues, and has declared that it must continue, the surcharge on English journals.

The Stockholm journals announce that the King of Sweden has issued orders to the Post-Office department to get ready the packet steamer *Nordstjerna*, for the purpose of conveying between seventy and eighty manufacturers and intelligent workmen to the Thames, in order to visit the Crystal Palace. The vessel is to sail from Gottenburg upon the 16th instant. The travellers will be allowed a fortnight's time for their excursion, exclusive of the voyage.

Forged Bank of England notes have recently been largely circulated at Norwich by some London swell-mob men.

His Royal Highness the Duke of Cambridge has presented a free site for the Cambridge Military Asylum at Kingston; and the Marquis of London derry will preside at a public dinner in its aid on Friday, the 11th inst., supported by a host of noble stewards.

An order of the House of Commons, with the consent of the parties promoting and opposing the Metropolis Water Bill, has been issued for printing *de die in diem* the evidence taken before the committee. Petitions against the bill have been presented from the Metropolitan Sanitary Association, and from the commissioners for paving and lighting from Woolwich; also from St. Anne, Limehouse: with one from Westminster in favour.

On Saturday, the half-yearly general meeting of the members of the College of Preceptors took place at their offices, 36, Bloomsbury-square; Mr. T. C. Freeman in the chair. There was a full attendance of gentlemen of the scholastic profession, and the meeting was addressed by several gentlemen, all of whom bore testimony to the usefulness of the institution, and the praiseworthy manner in which it was conducted. The report gave a general view of the proceedings during the past half-year, and, among other circumstances, related a new feature recently taken up by the college, viz. that of examining the schools of those principles who may desire it, and giving certificates of proficiency to those pupils who have attained a certain amount of information.

A "climbing boy" was suffocated in a flue, last week, at Leeds.

The Liberals of Bath, in consequence of the loss of names of intimidation which came under their notice at the recent election, have drawn up a petition to the House of Commons in favour of the ballot.

On Friday morning week, a young man named Stephen, an assistant to a timekeeper in Compton-street, Soho, went to the Serpentine for the purpose of bathing. He made an attempt to swim to the model frigate, but when within a short distance of the vessel he suddenly disappeared. He was found in about ten minutes, but life was extinct.

A large number of working men, inhabitants of the town of Kingston-upon-Hull, and personally interested in the maintenance of its trade, have successfully memorialised the Corporation of that borough to call a public meeting of the working classes of the borough at his earliest convenience, for the purpose of urging upon the Municipal Corporation, the Corporation of the Trinity House, and the Dock Company, the necessity of taking into consideration the charges upon shipping and merchandize at that port, so as to correspond with the charges of neighbouring ports.

Capt. Comstock, of the *United States* mail steam-ship, has placed in the Liverpool Exchange Rooms the model of a rudder, constructed by Captain Lawton, of the ship *Warren*, bound from Glasgow to New York, and by which that vessel, with a valuable cargo and 150 passengers, was steered safely to her port of destination after having lost her rudder 2000 miles from New York. It is constructed chiefly of rope, with lashings of wood and iron, and was attached to the tiller by a series of chains, with a couple of blocks and ropes.

The Irvingite chapel, or meeting, established in Berlin, and frequented by sectarians of that profession, was closed by order of the police on Sunday last.

The railway facilities for conveyance of fish were illustrated on Friday week, in the Committee of the House of Lords on the bill of the Great Northern Railway Company for communication with Grimsby Harbour, by the statement of an extensive dealer in the London fish market, that, by means of the railway communication between London and Grimsby, he had received 8000 lobsters that morning, and sold them for the supply of the metropolis, the cargo leaving Grimsby at 8 p.m., and arriving in London at 4 a.m.

On Sunday last, being the Sunday within the octave of Corpus Christi, was observed with great solemnity in the Roman Catholic Church. A grand solemn high mass was celebrated at St. Augustine's, Granby-row, Manchester, which was splendidly decorated with flowers and other devotional emblems, and the nave thronged. Whilst Mr. Bardsley (the organist) was playing, and the full choir singing the "Domus nobis pacem," Mr. Bardsley fell back from his seat at the organ, and was conveyed from the choir to the sacristy, where he died on Monday morning at half-past five, having never spoken after his attack. The coincidence of the chorus "Domus nobis pacem" with the death-strokes of the organist whilst playing it, was exceedingly affecting. Miss Bardsley (one of the deceased) was in the choir singing at the time.

Ram Lall, the famous Muttra banker (India), who recently gained the great opium case on appeal to the Privy Council, has just presented a thousand rupees (£100) to the Bombay School of Industry.

On Saturday afternoon, about four o'clock, a fire broke out in the workshop of Mr. Middleton, carver and gilder, Woolpack-lane, Nottingham. By six o'clock the fire was extinguished, but not before the building was much gutted. The loss altogether, including the building, is estimated at nearly £1000.

On Saturday, the Leicester auxiliary branch of the National Association for the Protection of British Industry and Capital held its first annual meeting at the Crown Crowns Hotel, Leicester; Lord Berners in the chair. A deputation from the National Society in London, consisting of Mr. George Frederick Young and other gentlemen, attended.

On Saturday evening the Lord Mayor gave a grand banquet to the Royal Commoners, in celebration of the Great Exhibition of the Industry of All Nations. Covers were laid for above 200 guests in the Egyptian Hall, which was tastefully decorated for the occasion with a variety of flags and banners. The original scene in Nash's pictures of the opening of the Great Exhibition were placed in the saloon by the express permission of her Majesty, to whom they belong. They attracted great admiration, both on account of their artistic merit, and faithfulness as delineations of this remarkable event. Amongst the distinguished guests present were—Lord J. Russell and the Hon. Miss Elizabeth Lyster, Earl and Countess Rosse, Earl Granville, Lord and Lady Londesborough, Lord and Lady Overstone, Baron Duplin, and M. Buffet, Minister of Commerce of France

Mr. Edward Jesse, a gentleman who has held the important offices of Surveyor of the Royal Parks and Palaces for the long period of 34 years, and who is now about to retire, was waited upon at his residence at Richmond, on Thursday, last week, by a deputation from the Queen's tradesmen, who presented Mr. Jesse with a handsome piece of plate, and an address, signed by nearly 60 Royal tradesmen, eulogising that gentlemen for his honourable and disinterested conduct during so long a period of service.

The wife of William Salsbury, labourer, residing in a village near Coventry, has given birth to triplets.

A case has been submitted to counsel, Sir Fitzroy Kelly, Mr. Walpole, and Kenyon, by the Cape delegates, on the question of the legality of the instructions under the sign manual sent out by Earl Grey in May last to the colony, and these learned gentlemen have pronounced those instructions "illegal and invalid."

Among the visitors at the Exhibition on Saturday were the French ecclesiastic, the Archbishop of Bordeaux and the Bishop of Nevers.

From Rome we learn, on the 16th ult., the anniversary of the creation of the present Sovereign Pontiff, high mass was sung at the Sistine Chapel by his Eminence Cardinal Fornari; all the cardinals and prelates present who usually attend that ceremony were present. The Castle of St. Angelo announced he event at break of day by a salvo of artillery, and Pontifical banners fluttered in the breeze from the battlements of the city. At night there were illuminations.

An order of the French Government has arrived at Toulon for the arming of three war steamers, which, it is said, will cruise on the Italian coast.

The Republican party at Rome, after having tried almost every expedient in order to vex the Papal and French Governments, has now hit upon a new plan of prosecuting the no-smoking crusade by mixing exploding cigars amongst those sold by the patented shops.

The weather in Paris this week has been excessively hot. At the review in the Champ de Mars on Thursday, eight soldiers died in consequence of the heat.

Three fine milch cows belonging to Mr. J. Phiraclea, of Pennington, near Ulverston, have been poisoned by manure which had been spread on the field where they were grazing. Their stomachs were found to contain particles of paint, window lead, and glass, from which death is supposed to have resulted. The manure was procured from a painter's ash pit twenty-two months ago; and the land was ploughed down with wheat, sown with seed the same season, and pastured this summer with milch cows.

On Wednesday (last week), nearly sixteen years after the departure of William Motherwell, the Glasgow poet, from the busy scene of life, the reproach to the surviving friends of that gentleman was removed, by the erection of a handsome tomb over the resting-place of the remains of the poet in the Necropolis of Glasgow. As a work of art, the monument is highly creditable to the genius of Mr. Mil.ans.

A few days ago, a man named Matthews, a glazier, of Walton-on-the-Wolds, was brought up before the magistrates at Melton, charged with "witchcraft," and was fined 13s. It appears his practice was to "charm away the yellow jaundice?" for which, in cases of cure, he charged the sum of one shilling!

The Lord Mayor and the Court of Common Council, upon the recommendation of the City Lands Committee, to whom the application was made, have granted the use of the Guildhall for the 23rd instant, for a grand Highland dress and fancy ball, for the benefit of the Scottish Hospital and the Caledonian Asylum, in precisely the same state as when her most gracious Majesty will honour that ancient hall with her presence upon the 9th July."

M. and Madame Poitevin last Sunday ascended from the Champ de Mars, at Paris, in a phaëton and pair attached to a balloon, and effected their descent safely. The French authorities have, however, forbidden such ascents in future, and none but experienced aëronauts are to direct balloons, and no one may accompany them unless it be for scientific purposes.

CHESS.

TO CORRESPONDENTS.

A LOOKER-ON—THE CHESS TOURNAMENT.—Pressed as we are for space at this busy moment we must decline the needless task of refuting the non-reasible mis-statements which the well-known writer on Chess in *Bell's Life* in the habit of publishing on the subject of the Chess Tournament has made. The impossible demands and moderations cannot we hope be the fact, but the understanding has brought together the finest body of players ever congregated, and called forth the largest assemblage ever seen ever called for Chess; numbers have arrived from over one so many foreign player, it has been the means of assembling all the best players of Europe, and, in place of raising on y a few pounds among the members of a single club it has called forth upwards of £500 from the members of every club of note (including the St George's, the Liverpool, the Edinburgh, the Nottingham, the Oxford, the Cambridge, the Berkshire, and the Glasgow) in the kingdom

E H.—We have received at least a hundred games, that a player may have two Bishops of the same colour, or two Queens on the board at the same time

NEW RUGBY.—It should be 1. Kt to K 5th.

J. Ashford.—They shall appear in due time. You must bear in mind that we have at least two hundred problems on hand which equal claim to publicity 7. No. He might play the pawn where he pleases!

J H. Salisbury.—You are quite wrong

HG. MALA.—We are pleased to see work from our old Corresponde nt again. His seven-move problem shall be reported on very shortly

R J M. Glasgow.—There is no decided advantage in the first move; but most players prefer having it

DAN ANTEN—Impracticable according to the terms, since Black on his third move may take the Queen's Rook

A TOURNAMENT SUBSCRIBER.—With our limited space, it is quite out of the question to enter into any long analysis of so difficult a position. Work is out with some strong player, and you will soon find that White can win. The game in question was not given as one of the Tourney games at all

F G. Wake Newington.—A player cannot take an adversary's men in the act of castling

HG, Ha!—We have heard of his work on openings (mind not), but cannot on any account spend so much time about it

ANXIOUS.—Anxious of engaging in a correspondence game of chess, for a two guinea set of staunton chessmen, may hear of a competitor by addressing "H J Harding, Dockstreet, Hunter

SOLUTIONS OF PROBLEM No. 386, by Strickland, F G H, Dereon, Judy, St Edmund, J E, and Rice of Stuttgart, are correct

THE CHESS TOURNAMENT.

(To the Editor of the ILLUSTRATED LONDON NEWS*)*

SIR,—Have you seen a certain scurrilous article, entitled "THE MOCK NATIONAL CHESS TOURNAMENT," which the proprietors of a well-known sporting paper have had the bad taste to admit into their columns? People will tell you that it refutes and obscures itself by the cloud of wanton misrepresentations which it makes, and which are rendered incongruous by facts known to all; that no gentleman should notice misstatements, which are neither supposed from a gentleman, nor are couched in the terms current in decent social intercourse; misstatements which, in a great measure, even contradict themselves, and are as remarkable for bad logic as for good round unmistakable vulgarity and slang. This is all very true; but, as the observations I wish to make on this article will occupy but little space, and, I flatter myself, may be of service in showing the character and spirit of the opponents of the Tournament, I do trust you will give insertion to the following remarks:—

First of all, no one can point, as far as I am aware, to any "Mock National Chess Tournament" now existing; and certainly the Chess Tourney at Cavendish-square is not a mock National Tournament, because it is not a "National" Tournament at all, and never professed to be. It is a Tournament in which players of all nations and nationalities were admissible. What is national is confined to a nation. This passage of arms was from the first thrown open to all the world: it never was, or was intended to be National, and therefore never could be "Mock National." To contrive to infuse a travestie even into the title of an article, is beginning badly, and is like writing false on one's own forehead, which this writer never need be told was not to do. Comparing small things with great, a man might exclaim against the Exhibition as "Mock National," for it is just as little national as this fourney of Ches. In either case, it is like accusing a man of having a mock gold snuff-box, when in truth it is platinum, and not gold.

In the second place, in this same quarter, it was asserted formally—all Chess-players must remember it well—that the writer had made inquiries, and that it was an assured fact, on which his readers might rely, that no foreign player of eminence, except Kieseritzky, would attend the Tournament. I would merely ask, did he speak truth? Has it been as he said, with so much gratuitous formality, it won d be? Yes, it now seems he was quite right. His logic is this: Jaenisch was announced as having promised to come from Russia, if he could get away, and he did not in the first instance appear in the lists. As if a person several thousand miles away, and in a country like Russia, where leave of absence from the Emperor himself must be obtained before the meanest subject can depart, might not meet with unforeseen delays! No: it must have been that you were guilty of wilfully deceiving the public when you announced Jaenisch's expressed intention. But, after all, Jaenisch has arrived! and, besides him, Szen and Kieseritzky, and Lowenthal and Anderssen; and Elephant himself is here, or I mistake, by this time. How much for the prophecies! In the third place, the writer asserts no money was received from abroad for the prizes of the Tournament; therefore, the Tournament is a worthless thing. Now, the promoters not only did not solicit foreigners for subscriptions, but their secretary was expressly instructed in a contrary sense. So much for the alleged canvass for pence abroad—*a canvass that was never contemplated or occurred.* Ay, but then the French subscribed only £5! For the private expenses of Kieseritzky, which is, of course, a glaring instance of illiberality on the part of the English committee. Such is the logic of this scribe! Once more, Mr. Williams, from the Divan, was "pressed" to enter the lists in order to make up the requisite number of combatants. By whom pressed? Perhaps by the calumniator himself. Certainly not by the Committee, who never held communication with him or any other player in the same quarter.

Mr. Mucklow, a member of a provincial club, was also "pressed." Nothing can be more untrue. "The number of players who entered the lists was but thirteen, till three other players were induced to add themselves." Again. The number of players who inscribed their names and paid their subscriptions would nearly double thirteen. "But *Mr. Bradle at the very last moment was attracted to join.*" Once more, false! It was with some difficulty he was admitted at all, and then only with Mr. E. S. Kennedy, in the place, provisionally, of Schumoff and Jaenisch, who were expected before the play began. Well, but *the games are played with locked doors, no one being present but the two antagonists*; and *the richer of the two may obtain the victory by other means besides check-mate!!* How much lower would this writer degrade the game of Chess? Would he have the public believe that it is habitually played only by persons of his own stamp? But the shortest answer and the best is—false again. The games are not so played. Subscribers to the Tournament may, and do enter; and, besides the players, those who take down the games are always present. I have no wish to pursue this head-roll further. As for the flowers of congenial rhetoric which are poured forth in teeming affluence from the rank soil of the writer's mind, one can make no return in kind; and I shall, therefore, conclude by assuring you I am, very truly yours,

A LOVER OF THE GAME OF CHESS.

MEETING OF THE BRITISH ASSOCIATION.

(From our own Correspondent.)

APPROACHING TOTAL ECLIPSE OF THE SUN.

The British Association may now be considered as of age, having reached its majority and 21st year. In 1831 it sprang into existence at York, and has ever since gone on in so efficient a manner, that it may not be out of place to observe how many of the men of activity and science, who have contributed and are contributing so much to the triumph of the grand international Exhibition, made their *débût* on the stage of the British Association, whilst even the elder members have owed much of their advancement in scientific fame to the same source As a public field, therefore, it has been of manifest importance; and, on a retrospect, the distinguished names of Herschel, Airy, Brewster, Faraday, Green, Owen, J. and E. Forbes, Robinson, and Robison, Jameson, Sedgwick, Whewell, Buckland, Murchison, Reid, Sabine, Phillips, Royle, Henslow, De la Beche, Yarrell, Thompson, Patterson, Ramsay, R. Hunt, Graham, Playfair, Ibbetson, Porter, Mantell, Wheatstone, Rawlinson, Talbot, Greenough, Sykes, Powell, Strickland, Danbeney, Lindley, Allman, Lloyd, Hamilton, Ansted, Ball, Lyell, Brisbane, Nasmyth, Fairbairn, Whitworth, Roberts, Hodgkinson, Mallet, Stevenson, Osler, Jardine, Johnson, Ramsay, Scrresby, Henfrey, Carpenter, Lankester Latham, Prichard, Peacock, Rennie, Lubbock, Russell, Harris, Lardner, Hodgkin, and others, will be found in close connection with its parentage, not to specify the illustrious foreign philosophers and those of our own country who have been taken from us, to swell the list which reflects so much honour on the institution in every branch of intellectual progress.

Our readers are aware that on the 28th of this month there will be a total eclipse of the sun, which will afford peculiarly favourable opportunities for observations to elucidate most important phenomena, viz. applying specially to the physical structure of the sun and moon, as those of the corona and of the rose-coloured prominences (seen so markedly in the eclipse of 1842), photo-metric, thermometric, and actino-chemical radiations from different parts of the sun's disc, and particularly the state of polarisation of the light in different phases of the eclipse, and the irradiation generally, and the distortion of a dark limb by the formation of beads or threads. It is gratifying to know that arrangements have been made by a committee of the British Association, in conjunction with Struve, with foreign astronomers in Russia and elsewhere, to combine their observations with those to be made in England; and we have no doubt but that the extraordinary nature of the red prominences as well as other desiderata will be ably noted and considered on this occasion. Various instruments have been recommended to ensure the extent of information required, and it is considered that telescopic images of the obscured luminary will be taken at different stages, and as accurately as the transitory changes of the object will allow. The naked-eye observers need only use a dark glass; and to have the four or several shades will be of great advantageous. Among the commoner kinds of observation, many of our readers may be advised to look for the following, which they can easily do:—Whether there is a red band of light near the horizon, or in any part of it; whether the outlines of hills can be seen; whether the smoke of chimneys can be seen; whether any plants (as the sensitive plant, the convolvulus, or the silk-tree Acacia) close their leaves or petals; whether animals appear frightened; whether any dew or fog is formed; and whether there is any fluctuation of light on the ground or walls.

It is only possible in a total eclipse to ascertain the interesting phenomena which have been indicated for the general watchfulness of astronomers, especially throughout the north of Europe; and years will elapse before another such opportunity will occur.

TUESDAY Evening.

The town is already stirring with the assemblage of the Association and the preparations for the reception of Prince Albert to-morrow forenoon. Triumphal arches are preparing at the railway terminus and in the principal streets, and loads of laurel branches, oak and other boughs, and floral embellishments are profusely scattered about. The section-rooms are close together, which is a great convenience, and they appear to be also well adapted for the accommodation of the meetings. In the eleven o'clock train was a sprinkling of the "eminences," and others had arrived yesterday. Lord Rosse, the Bishop of Oxford, Mr. Hallam, Mr. Lyell, Mr. Airy, Mr. Grove, M. Dumas, Mr. Horner, Mr. Barlow, Mr. Sedgwick, Profe-sor Henslow, Sir J. Clarke Ross, Sir Charles Lemon, Professor Allman, Sir R. Murchison, the Astronomer Royal, Mr. Scott Russell, Mr. Babington, Professor Owen, and Lieut.-Colonel Sabine.

By the evening train, fresh accessions appeared, and the Prince's splendid carriage excited quite a sensation as it passed through the streets.

Three sections were appointed for the dinner parties, instead of one numerous assemblage; the whole attendance, however, was scanty, and exceedingly quiet.

The general Committee met at one o'clock, but there were many active members absent, and their final elections were incomplete till to-morrow.

The officers for this year are:—

President—Rev. B Airy, Astronomer Royal

Vice Presidents—Lord Bexdesham, Lord Bishop of Norwich, Profe-sor Sedgwick, Professor Henslow, Sir John Herschel, Sir W F W Middleton, F C Calvert, M P; Mr T Hurst Western.

General Secretaries—Lieut.-Colonel Sabine, Mr J Forbes Royle.

Assistant General Secretary—Mr John Phillips

General Treasurer—Mr John Taylor

Secretaries—Messrs Charles May; Dillwyn Sims, G A Biddell, George Bansome, and the Rev S J Jackson.

Treasurer—Mr J B Alexander.

The applications for admission at Bishop Hatfield's Hall being greatly in excess of the accommodation it affords, the warden and senate contemplate the opening of a new hall, for the reception of students, in October next. Two Fellowships are to be filled up in November.

A letter from Rome, of the 24th ult., states that Girolametto, Carbonaretto, and several other persons, accused of having had a hand in the assassination of Count Rossi, have been set at liberty.

SANITARIUMS, FOR EXERCISE OF INVALIDS AND OTHERS IN ALL WEATHERS.

(To the Editor of the ILLUSTRATED LONDON NEWS.*)*

SIR,—For many years it has been my decided conviction that all public hospitals, and other buildings erected for the recovery of the sick afflicted, are defective in construction, from the want of suitable accommodation, a healthy climate, and sufficient space for exercise to their numerous inmates, without exposure to the open air.

All must acknowledge that the variableness of our climate, the humidity of our atmosphere, and its murkiness and impurity in the neighbourhood of large towns, and especially in London, is so great during the winter season that open-air exercise for invalids often proves the reverse of being conducive to health.

On turning my attention more particularly to the subject, I am the more convinced of the importance of having Sanitariums for exercise connected with public hospitals in all large towns: nor do I think it necessary even to confine such structures to the use of invalids or of hospitals; but, on the contrary, I would advocate their adoption as promoters of public health, combined with pleasing instruction; and by this means some of the squares of London might, by being covered with glass, form the most delightful and interesting places of resort at all seasons.

To render, however, such buildings in every way efficient, the following requirements should be supplied:—

The dimensions ought to be sufficiently ample to admit of persons taking full exercise.

The benefit of the sun's rays ought to be always, when possible, secured.

The climate should be temperate, pure, without undue humidity, and with a sufficient supply of oxygen to render it healthy.

The ventilation should be constructed to afford a free circulation of air without any currents; and a cool, equable temperature should enter the building until it has been warmed, purified, and rendered fit for easy respiration.

The preceding remarks embodying my views on the subject, I felt more than ordinary pleasure on receiving, six weeks ago, an intimation that some of the gentlemen connected with the new hospital now in course of erection at Victoria Park wished to consult me respecting the propriety of having a Sanitarium attached to that building. The result of the interview with the deputation was a full investigation, and, on the 25th of June (the day on which his Royal Highness Prince Albert laid the foundation-stone), were submitted to his Royal Highness and the gentlemen connected with the institution, and received their cordial approbation.

The proposed building (represented in the next page) is intended to be 200 feet in length and 72 feet in width; and, although standing apart from the hospital, is to be connected with it by two corridors. In this design I have considered and secured all the properties necessary to render such a place suitable for the purpose intended.

By covering the building with glass, placed in an angular form, the sun's rays (so important to health) will be freely admitted. The dimensions, after the interior is laid out, will afford a good space for exercise and recreation. The outer air, before it is dispersed through the interior, undergoes a process of filtration. Being admitted through tunnels to the centre of the building, it is there modified by heat, ascends a shaft 12 feet in height, and is thence distributed, some to re-appear and undergo another filtration, and the remainder to escape from the roof. The plants which will decorate the interior will be such as are known not to emit unhealthy exhalations, and that give out a large quantity of oxygen. Thus the air will be rendered and kept pure and exhilirating, and the tender lungs of invalids will be stimulated and fed.

I am, yours, &c.,

JOSEPH PAXTON.

DESIGN FOR "A CRYSTAL SANATORIUM," BY JOSEPH PAXTON, F.L.S.—(SEE PREVIOUS PAGE.)

THE EXETER DIOCESAN SYNOD.

IN the Postscript to our Journal of last week, we reported the proceedings of the Synod to Thursday evening. We now engrave the Bishop's Throne; and the Chapter House, in which the Synod was held.

The Bishop's throne is of dark oak, about 53 feet in height. The canopy is composed of pointed arches, columns, niches, pinnacles, and foliated ornaments, tastefully and delicately carved, rising in a pyramidal form, and finishing in a series of ascending spires. It was erected by Bishop Bathe, in the year 1470. During the Commonwealth it was taken down and concealed, but replaced at the Restoration, and now remains almost as perfect as when first erected. It stands on the south side of the choir, and immediately opposite the pulpit. The Illustration shews the lower portion of this beautiful work.

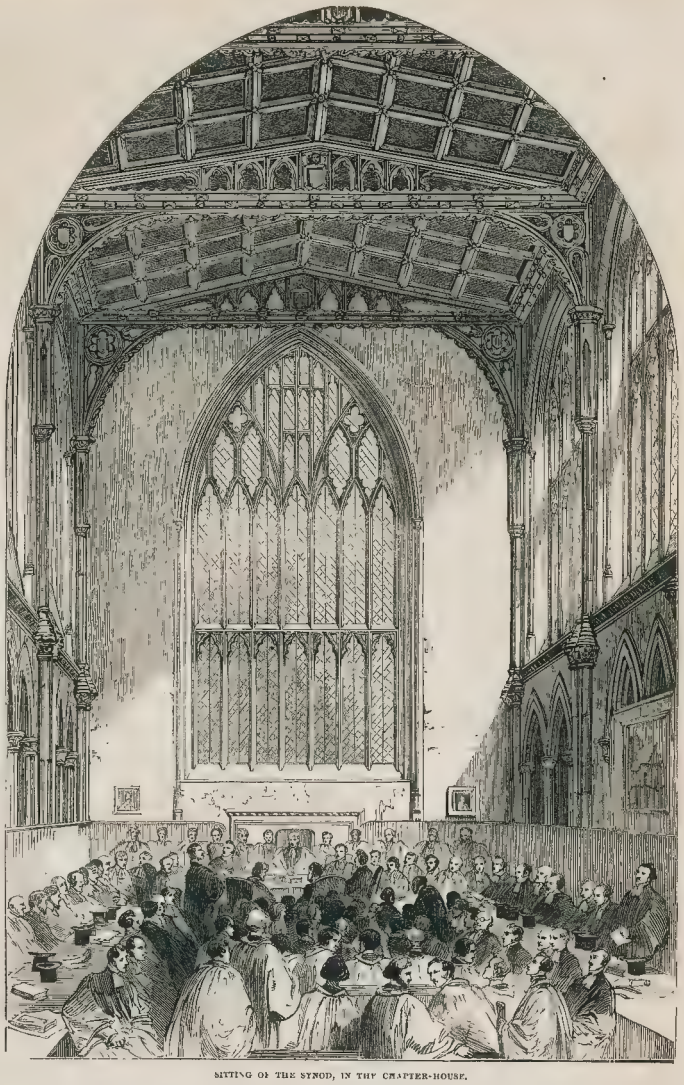
THE BISHOP'S THRONE, EXETER CATHEDRAL

The Chapter-House stands in the cloisters, adjacent to the south tower of the Cathedral, and is said to have been built by Bishop Lacy (consecrated 6th April, 1420); but the lower part being different in style from that of the superstructure, and so much resembling the church, it is probable this portion was the work of Bishop Quivil. It consists of a splendid room, measuring, with its vestibule, 75 feet by 30 feet. Its richly ornamented roof and general design will be found exceedingly interesting. The library, which used to be kept in the Lady Chapel, has been removed here. It contains about 8000 volumes, among which are many valuable and scarce books. The oldest printed book in the collection is a folio edition of "Cæsar," printed in 1471, in a very good state of preservation. Among the Cathedral MSS. (not shown without express permission) are some of genuine Saxon origin; a perfect series of accounts of the building of the Cathedral; the episcopal registers from the time of Edward I.; and a volume of the "Doomsday Survey" of William the Conqueror, relating to the counties of Devon and Cornwall, of the size and style of the small Exchequer volume. A curious circumstance occurs relative to the Exeter "Doomsday:" a leaf was missing, and a few years ago it was discovered by a gentleman in the country and restored to its place.

Our Illustration shows the interior of the Chapter-House: it is of the Perpendicular period of Gothic architecture. The books are ranged round the room under the arcades beneath the windows. On the occasion of large meetings like the present, the shelves are protected by canvas.

On Thursday morning the Bishops and clergy attended divine service at the Cathedral, and afterwards proceeded to the Chapter-house, where the discussion on the declaration touching the Sacrament of Baptism was resumed; and, after the delivery of several addresses to the Synod, the declaration was unanimously adopted.

The Synod then proceeded to the consideration of the subject of Education according to the principles of the Church of England, and passed, again unanimously, a series of resolutions in support of the Diocesan Training College, the enlargement of which is contemplated, and of an efficient system of diocesan inspection. An adjournment then took place for the purpose of attendance on the afternoon service at the Cathedral; and, on the Synod re-assembling, the subject of public catechising on Sundays and holydays, after the second lesson at evening



SITTING OF THE SYNOD, IN THE CHAPTER-HOUSE.

TRIAL TRIP OF THE "BARON DOSY," IRON STEAM-SHIP.—(SEE NEXT PAGE.)

prayers, was considered, and a resolution passed expressing the opinion of the Synod:—

That the practice of catechising is binding upon "the curate of every parish," and should be carried out so far, at least, as each, in his discretion, shall judge to be most edifying to the congregation wherein he ministers.

The Synod was then adjourned, at six o'clock, to the following day.

The following are the resolutions agreed to on Friday:—

That the continued pastoral superintendence of the young who have left school is a subject deserving the most mature consideration; and that the whole matter be referred to a committee to be forthwith nominated by the Lord Bishop, and to report to his Lordship; and that the committee be requested to confer with the diocesan and local boards in this diocese on the subject.

It was next moved—

That this Synod believes that the restoration of a permanent, or comparatively permanent, order of deaconship, under proper restrictions, would be highly advantageous to the Church; and that the Bishop be respectfully requested to consider under what regulations such an order can be best established.

[This resolution was not carried unanimously, there being five dissentients.]

That it is desirable for the parochial clergy to obtain, as far as possible, the aid of their lay parishioners, especially by encouraging voluntary associat on for good works, provided always that care be taken not to transgress the discipline of the Church.

That this Synod do invite the earnest attention of the clergy of this diocese to the several orders of the Church in the Book of Common Prayer, and in the canons respecting the saying daily of the Morning and Evening Prayer; also, that the earnest attention of the clergy of the diocese be invited to the 13th and 14th canons as to the due observance of holydays, and that it is the firm opinion of this Synod that the due observance of Ascension Day includes the celebration of Holy Communion, a special preface being provided for it

The proceedings having been brought to a close, the bishop offered up a prayer, and the Synod was dissolved.

It has been announced that the acts of the Synod will be published by authority.

THE "BARON OSY" STEAMER.

THE *Baron Osy* iron steam-ship, of 600 tons, and 230 horse-power, has just been constructed, by Messrs. Robinson and Russell, at Millwall, for the Antwerp Steam Navigation Company, to trade between Antwerp and London. The *Baron Osy* has been so named in honour of one of the most eminent citizens of Antwerp, long a banker and merchant, and now a distinguished member of the Belgian Chambers. The ship is 200 feet long, and 25 feet beam; has accommodation for 120 passengers and 20 horses; and carries 60 tons of coals and 300 tons of goods. The *Baron Osy* has been found to have a speed of 12½ miles an hour, and performed the first voyage from London to Antwerp in 16½ hours against tide, under the command of Captain Jackson, so well known on that station as an able and experienced commander. The cabins have been elegantly decorated by Mr. Crace; and there has been added to the usual accommodations a large poop-deck, which is a great luxury to passengers.

As we stated on the occasion of the launch, the *Baron Osy* is the handsomest model of a steam-ship that has for many a day been seen on the river. She is built on the wave principle of Mr. Scott Russell, and is a curious example of the advantages which a good shape of ship possesses over a bad one. It has been matter of doubt to many whether the great advances made in steam navigation with respect to velocity within the last 10 or 15 years are to be attributed mainly to improvements in steam-engines or in ships. What is certain is, that since the introduction of the wave form generally, or of approximation to it, the velocity of ships has much increased. The *Baron Osy* is an example which seems to settle the question of the very great advantage which the new form possesses over the old. A pair of old engines have been taken out of the *Princess Victoria* steam-ship, and have been placed in a vessel of equal beam, and greater capacity and displacement; and whereas the vessel of the old shape never exceeded 10 miles an hour, or 22 strokes of the engine per minute, the new has exceeded 15 miles an hour, and with 29 strokes per minute of the same engine propelling through the same wheel! It is plain that, with every allowance for efficiency of boiler and engine, the improved form of the ship has been established as a most important element of speed.

At the trial trip of the *Baron Osy*, on Friday (last week), we present a large and distinguished company, including many eminent foreign men of science and engineers. The trip down the river was rendered very interesting by the excitement of a race. One of the most recently constructed and fastest vessels trading out of the Thames was observed passing the *Baron Osy* when off Erith, and a public speed, as if to challenge a trial. Captain Jackson accepted the challenge, and ordered the engines to go half speed, until his rival had passed him and gone considerably ahead. Full steam was then put on, and after a sharp contest the *Baron Osy* won an exciting race.

NATIONAL SPORTS.

The racing fixtures for next week are, with one exception, of small interest. The exception is Liverpool, which always provides a good bill of fare, and rarely fails to come up to the mark. The sports commence on Wednesday, and terminate on Friday. Worcester offers some moderate sport on Monday and Tuesday, Jersey on Wednesday, and Plumstead on Friday.

The only aquatic appointments of any interest are the Royal Thames Yacht Club Match for the Queen's Cup on Wednesday, and the Royal Mersey Yacht Club Match on Saturday.

The Cricket fixtures are as follow:—Monday, at Lord's and Wolverhampton; Wednesday, at Beckenham-place, Kent; Thursday, at the Oval and Brighton; Saturday, at the Oval.

TATTERSALL'S.

MONDAY.—The betting this afternoon was dull, and noticeable only for the general anxiety to back Sreba, The Baron, Presto, Desdichado, Nancy, and Young Idlestone, for the events in which they are respectively engaged.

THURSDAY.

HANDICAP.—Longinus, 1. California, 2.

PLATE of £30.—Manilla filly, 1. Distance, 2.

The CHESTERFIELD STAKES.—Bay Rosalind, 1. Lapidist, 2.

CARLISLE RACES.—TUESDAY.

The FREE HANDICAP.—Emilius filly, 1. Jack Leaming, 2.

The HUNTERS' STAKES.—Kirk, 1. Maley, 2.

The CORBY CASTLE STAKES. T.Y.C.—Mr. J. Osborne's Merry Bird, 1. Mr. Meikham's Evadne, 2.

WEDNESDAY.

The CUMBERLAND PLATE of 100 guineas, added to a Handicap Sweepstakes of 10 sovs. each.—Mr. Wrather's Maid of Masham, 1. Lord Stanley's Legerdemain, 2

The SPECULATION PLATE of £25, added to a Sweepstakes of 5 sovs. each.—Fifty-three. 1. Gulliver, 2.

The CARLISLE STAKES won by The Collier, beating High Pressure.

On Tuesday the standing orders committee of the House of Lords, to which the Government bill for the removal of Smithfield Market was referred, decided that the standing orders had not been complied with, and that they would report their opinion that the bill ought not to be proceeded with.

Mr. Bouverie and Sir G. Grey have brought in a bill, which has been printed, to continue till October 1, 1852, and to the end of the then next session of Parliament, the act (3 and 4 Vict., c. 110) to amend the laws relating to loan societies.

From a return which has been printed by order of the House of Commons, it appears that the law charges incurred by the Office of Woods and Forests in law and surveying charges on account of the land and works at Birkenhead in 1844, 1845, 1846, 1847, 1848, 1849, and 1850, were—Law charges, £2350; surveying charges, £1922.

On Tuesday, the *Kaseid Hir*, steam-yacht, built for the Pacha of Egypt, was launched from the premises of Messrs. Joyce and Co., opposite the *Dreadnought* hospital ship. Her dimensions are—Length, 153 feet; beam, 18 feet; depth, 11 feet, builder's measure. Old measure, 239 52-74 tons. She is to be fitted with a screw-propeller and a pair of vibrating engines of the collective power of 80 horses.

METROPOLITAN NEWS.

ROYAL BOTANIC SOCIETY.—The last show of the season took place on Wednesday, and was very brilliantly and numerously attended. Indeed, the flower-shows seem to be the species of exhibitions which make most head against the Crystal Palace—the beautiful grounds of the latter being crowded with one of the gayest assemblages of the season. The fruit show was really splendid—the peaches, nectarines, grapes, and strawberries especially so. Indeed, the wonderful size and exquisite flavour of the fruit appeared to make no little impression upon many foreign ladies and gentlemen who were present, and who probably little expected to see in England a display which France, Italy, and Spain could not, for all generally, equal. The pines were also very fine. The shrubs themselves are now planted in the rose garden, instead of being shown as bouquets—a happy idea, adopted this season for the first time. The Crystal Palace—the beautiful grounds of which are much admired. The gaiety of the promenade was enhanced by the a tenate music of the bands of the First Life Guards, Royal Horse Guards, and Grenadier Guards. The following is the prize list:

Extra Gold Medal: Mr May, gardener to Mrs Lawrence, Ealing-park, for thirty sbove and orchidee plants; Mr Mylam, gardener to S Hooker, Wandsworth, for twenty-five exo te orchids

Large Gold Medal—Mr Cole, gardener to Mr H Collyer, Dartford, for thirty-two and greenhouse plants.

Medium Gold Mr Smith gardener to Mr Quilter, Sorwood, Surrey Cape heaths Messrs Fraser, nurserymen, Lea-bridge-road, for twenty-three stove and greenhouse plants; Mr Turner gardener to Mr J Coster, Streatham, for twenty stove and greenhouse plants; Mr Franklin, gardener to Mrs Lawrence, Ealing-park, for twenty-five exotic orchids; Messrs Rollinson, nurserymen, Tooting, for twenty exotic orchids; Mr Blake, gardener to Mr. J S Saunder, Stratford-green, for fifteen exotic orchids.

Gold Medal—Mr Gaines, gardener to Sir S Anirobus, twenty stove and greenhouse plants; Mr Speed, Edmonton, for ten stove and greenhouse plants, Mr Cole, gardener to Mr H Colyer, Dartford, Kent, for fifteen Cape heaths; Mr Rack, Chewer Manor, Windsor, for twelve pelargoniums; Mr Turner, Royal Nursery, Slough, for twelve pelargoniums.

CONSECRATION OF ST. MATTHEW'S, WESTMINSTER.—The new church erected in Great Smith-street, in the parish of St. John, Westminster, was consecrated on Monday, by the Bishop of London. At about eleven o'clock a large number of ladies and gentlemen had assembled in the church; and at about half-past eleven the ceremony was commenced, and lasted till nearly two o'clock. The right rev. prelate preached an impressive sermon upon the occasion, taking for his text the verse "Let the brother of low degree rejoice in that he is exalted" (Jas. Epist. James, chap., i. v. 9). From a printed statement distributed throughout the church, it appears that the total amount of subscriptions was £11,412, and the total amount of expenditure £11,862, leaving a deficit to be supplied of £360.

THE RELIGIOUS REVIVAL IN STEPNEY.—On Sunday afternoon the parishioners of Stepney were much surprised at the closing of the ancient parish church. There was a notification on the doors, stating that the Bishop of London had requested the Rev. Mr. Poole to preach at Bethnal-green Church, not to preach, and in consequence the church would be closed until further notice of proceedings in the Ecclesiastical Court against several of the persons who made a disturbance in the church on Sunday last. To prevent a repetition of that disturbance, the bishop requested the Rev Mr. Poole not to preach.

NEW QUEEN'S COUNSEL.—The long expected appointment of additional Queen's Counsel at the Equity bar will, it is understood, take place forthwith. The learned gentlemen mentioned as likely to receive the honour on this occasion are Mr. Willcock, Mr. Chandless, Mr. Follett, Mr. Campbell, Mr. Daniel, Mr. Glasse, Mr. Craig, Mr. Headlam, and Mr. Baily. These elevations to the Inner Bar have become necessary in consequence of the contemplated increase of the sittings before the new Court of Appeal, and the recent addition of Vice-Chancellor Turner to the Equity Bench.

THE METROPOLIS WATER BILL.—An influential meeting, comprising magistrates, members of Parliament, and other persons locally or officially connected with the metropolis, was held at the Ship Tavern, Charing-cross, on Monday, to consider measures for a general and organised opposition to the Government bill for supplying the metropolis with water. Mr. B J. Armstrong, a Middle-ex magistrate, was in the chair; and there were present Lord D Stuart, M.P.; Sir James Duke, M.P.; Mr. Mowatt, M.P.; Mr. W. Williams, M.P.; Mr. Alderman Humphery, M.P.; Mr. L. Heyworth, M.P., &c. Several resolutions condemnatory of the Government bill were adopted, and energetic measures were determined upon to oppose the bill at all its stages. The bills in combined opposition to the measure, for which £500 were subscribed at the meeting.

SOCIETY FOR IMPROVING THE CONDITION OF THE LABOURING CLASSES.—The seventh annual meeting of this society was held on Monday at the Freemasons' Tavern. The Earl of Shaftesbury took the chair at two o'clock. Amongst the noblemen and gentlemen on the platform were the Marquis of Westminster, Lord Ashley, Lord Lincoln, Lord Grosvenor, M.P., the Bishop of Manchester, Vi count Ebrington, M.P., the Hon. W. Cowper, M.P., Rear Admiral Bowles, M.P., the Earl of Feversham, Sir Thomas Hastings, R N., Hon. and Rev. G. Courtenay, Rev. Sydney Smith, Rev. Dr. Hook, Rev. Dr. Stanley, Rev. J. M.P., Montague Gore, Esq., the Rev. Dr. Cumming, &c. The secretary read the report, in which the committee congratulated the society on the success of its labours, on the great increase in the number of allotments and cottages and garden allotments, and on the prosperity of its affairs in detail. The Marquis of Westminster moved the adoption of the report, and passed a warm panegyric on Lord Ingestre, who had died in the interval since the last meeting, and supported by the Hon. W Cowper, M.P., and unanimously adopted. The meeting was also addressed by the Hon. and Rev. S. G. Osborne, Dr. Cumming, Lord Ebrington, &c.

THE ALLEGED LUNATIC'S FRIEND SOCIETY.—The annual meeting of this society was held at their offices, 44, Craven-street, Strand, on Monday; Captain Digby, R N, in the chair. Mr. Perceval read the report, which set forth, that, in April, the society had only 249 members, and £73 18s. 8d. in subscriptions, donations, &c., received since that period to June 1, in the present year, amounted to £263 2s. 6d., making in all £373 18s. 2d.; out of which they had expended £309 11s. 3d., leaving a balance, less outstanding accounts, of £64 6s., which left a balance of only £4 2s. 11d., which sum had gone towards defraying the expenses of the present meeting, so that the society is now entirely without cash in hand. The report went on to state that many cases of cruel confinements were as much needed as ever, owing to the cruel and oppressive manner in which patients were treated in private asylums in England, compared with what they were in France and the Continental States.

THE PEEL STATUE IN THE CITY.—On Monday, the committee assembled at the Mansion House, for the purpose of selecting one from the number of sculptors who sent in models for a statue to be erected in the City, in memory of the late Sir Robert Peel, Bart., and deciding upon a site; Sir Peter Laurie in the chair. There were present the following gentlemen:—Sir J. W. Hogg, Bart., Sir Moses Montefiore, Bart.; Baron Goldsmid, Mr. John Dillon, Captain Shepherd, Mr. Bennoch, Mr. T. Hankey, Mr. John Pelly, Mr. John Dixon, Mr. Phillips, Mr. Donald Nicol, Mr. Rawson, Mr. R. L. Jones, Mr. Gladstone, Mr. Cobden, Sir E. N. Buxton, Mr. Dallas, Mr. David Salomons, M.P. for Greenwich, Mr. B. L. Solomon, Mr. Twining, Mr. C. Mills, Alderman Wire, and Sir T. F. M'Lean. The committee proceeded, soon after the chair was taken, to ballot, and the successful candidate was Mr. Behnes. After a short discussion upon the site, it was decided that the statue should be placed in the area at King William street and Princes-street was decided upon as the most eligible by a large majority. It was subsequently stated, that Mr. Behnes had intimated that if his model should be approved, he would execute it at his own cost.

THE GARDENESS' BENEVOLENT INSTITUTION.—Her Majesty has kindly consented to become the patroness of this excellent charity for the benefit of indigent governesses, and the Duchess of Kent has signified that she will have lately been also pleased to present to it a donation of fifty pounds. When we consider how much of domestic comfort, and, still more, of refined enjoyment, we owe to the services of our working gardeners, and the meritorious nature of their employment from the variations of season, the discriminating support of her Majesty and her illustrious consort is worthy of imitation.

THE MILLINERS' AND DRESSMAKERS' PROVIDENT AND BENEVOLENT INSTITUTION.—The third annual meeting of this association was held at Will s's Rooms, King-street, St. James's, on Monday; Mr. Stephen Lewis, of the firm of Lewis and Allenby, in the chair. A large proportion of the meeting consisted of ladies, patronesses and members of the Institution, which has been formed to enable those engaged in the various branches of the millinery and dress-making business to secure medical aid and pecuniary assistance in time of distress or sickness, by the payment of a nominal annual subscription. From the report read by the secretary, it appears, that, although established only three years, it has a fund invested amounting to £3680; which, added to the balance at the banker's, and other resources, makes the total sum of £3688 7s. 4d. The receipts of the past year, from donations, subscriptions, and various other sources, are £924 16s. 3d., of which £360 have been invested; the current expenses of the institution have been only £105, leaving a balance in hand of £318. There are now eighty-eight members, most of whom are under thirty years of age. Mr. Grainger moved the adoption of the report, and referred to the success which has attended the efforts of a kindred society for the benefit of milliners, of which he was honorary secretery.—Mr. Redmayne expressed his gratification at the favourable position of the society after so short a period, and said that a subscription of 2s. per month entitled any member to relief, in case of necessity or misfortune, while in sickness the first medical aid was gratuitously afforded. After the age of fifty-five the assistance given was of a permanent character.—Mr. Pocock, Mr. Rogers, and the Rev. Mr. Cumming, other gentlemen followed in support of the objects mentioned in the report; and several resolutions, in accordance with the views enforced by the speakers, were unanimously adopted. The usual vote of thanks was given to, and acknowledged by, the chairman, which concluded the proceedings.

FLOODS IN WESTMINSTER.—On Tuesday afternoon considerable alarm was occasioned to the inhabitants in the immediate vicinity of Westminster abbey, by a sudden and extraordinary inundation of water in their dwellings. In Charles-street, Gardiner's-lane, King-street, &c., it poured in steadily and uninterruptedly for more than an hour; the areas, courts, and basements of the buildings were quickly flooded, and laid several feet under water. The police-station and barracks in Gardiner's-lane were quite swamped, the men driven out of the mess-room, and the fires put out. This sudden visitation was occasioned by the waters of the Thames forcing the flood-gates of the recently constructed great Westminster sewer, up which it ascended, penetrating the houses on either side. Considerable difficulty was experienced in getting rid of the water; in some instances engines had to be got to pump it out.

ROBBERY AT THE LONDON AND WESTMINSTER BANK

A very cleverly planned and executed robbery was detected, at the moment of its commission, on Saturday last, at the West-End branch of the London and Westminster Bank, in St. James's-square.

For some weeks previously Inspector Lund and Sergeant Whicher, two very active officers of the detective police force, had been watching the movements of two men named William Canty and John Tyler (the latter an old returned convict), who were in the habit of prowling about and entering the bank on Saturdays, in the afternoon. The prisoners generally met daily, and frequently at the same spot—the mile-stone in the Uxbridge-road, in Hyde Park. From this place they were repeatedly watched to the London and Westminster Bank; and Mr. Commissioner Mayne having been made acquainted with the circumstances, he advised that the parties at the bank should be put upon their guard. Mr. Inspector Lund accordingly waited upon Mr. Oliver Vile, the manager of the west-End branch, and acquainted him with all the facts which had come to his knowledge. Mr. Vile was naturally much alarmed, and having informed Mr. Lund that on some occasions the bank cash-box contained more or less than the amount of £100,000, and that it was open to the reach of any person in the bank when his back was turned, an arrangement was made to place the moneys of the bank in security, and to allow the cash-box still to remain open for the transaction of business, and there accredit them. Both prisoners strenuously denied any knowledge of each other.

It is thought that the crime was conceived and carried out with the collusion of some parties in the bank

The prisoners were brought up for examination on Monday, at Marlborough-street police office, and were committed for trial on the charges.

There is another charge against Canty, for stealing a cash-box containing £40.

The teetotalers are about taking advantage of the unusual numbers of foreigners at the moment drawn to our metropolis for the purpose of visiting the Exhibition, and have announced a "Grand Teetotal Demonstration of All Nations" for the 5th of August, when they are to assemble in Hyde Park, decorated with white rosses, and march in procession to Kensington.

ROYAL PARKS AND PALACES.—A Parliamentary return printed on Wednesday, that the total expenditure on account of Royal palaces and gardens, and the appurtenances thereof, during the year 1849-50, was £92,329 11s 5d; including £2,000 for Buckingham palace, £1653 for the Royal Mews, £13 366, for Buckingham Palace, £6782 for Hampton Court, £1207 for the gardens to ditto, £1479 for Kew, £16,700 for Windsor Castle, £713 for Frogmore. £1625 for the garden of Buckingham Palace, and £2,000 for Brighton Palace. These charges are exclusive of the usual disbursements for the maintenance of the parks, payable out of the land revenues of the Crown.

REMOVAL OF OF TEMPLE-BAR.—On Monday morning, before the traffic of the day began, a number of workmen arrived at this ancient entrance to the City, with scaffolding, ropes, and tools, and in a short time were seen busily engaged removing the accumulated incrustations of years from its exterior. The stone-work is to be scraped and the wood painted, so as to present an aspect approximatively clean when her Majesty passes through to the entertainment at Guildhall.

ROBBERY.—On Monday night the station of the South-Western Railway, at Vauxhall, was broken open, two cash drawers forced, and £5 taken from one of them, which had been left on the overnight as change for the early down train. Early on Tuesday morning a window communicating with the booking-office was found wide open; one of the thick panes of glass had been starred with a bradawl or a nail at one corner, by which a piece of glass had been taken out sufficiently large to admit a man's hand, and by that means the catch of the window was unfastened, an entry effected, and access obtained to the cash drawers, which were lined with iron, and secured by Bramah's patent detector locks, which had been forced open. Both drawers had their safety-springs, and the one belonging to the drawer in which the cash was had been entirely removed, with the bolt in the position it would be when locked, and placed on the counter. Another drawer, containing a number of nine copies of age, was discovered under the staircase, and when found said, "It was not me, I didn't do it," though at that time no one had informed him that a robbery had been committed. He was taken before Mr. Beadon at Lambeth police-court, when the above facts were stated. The prisoner was remanded for a week.

BIRTHS AND DEATHS.—Births registered in the week ending Saturday, June 28th:—Males, 716; females, 703: total, 1439. Deaths during the same period:—Males, 919; females, 813: total, 1732. In the corresponding weeks of the years 1841-50 the average number was 924; if, for the sake of better comparison, this average be raised in the ratio of increase of population during the last ten years (which is at the rate annually), it will become 1016—an amount which differs not materially from the number now returned. It will be observed that there is an increase of more than 60 on the week under consideration. The increase is not, however, all due to cases which are the effect of increased mortality: it is due to cases where coroners have held inquests, in many of which, though they occurred at earlier dates, the registration had not been completed till the returns were compiled last Saturday. Under which designation in the table are classed cases in which persons have been found dead, or who have died suddenly, and the fatal disease has not been ascertained—these, which form the average by only 8, have risen last week to 29. But the great majority of inquests is on deaths from violence, privation, intemperance, &c., and in this the number has been in each of the last two returns above the average; in the former week amounting to 99, in the latter to 85. In the latter list the deaths of two persons are ascribed to privation, of 2 to intemperance, 2 to want of breast milk or inanition, 3 to poison, 7 to burns and scalds, 4 to hanging or suffocation, 16 to drowning, 41 to fractures and contusions, 2 to premature interment, 1 to cold, and 5 to wounds and other injury. The present return shows that the mortality from diseases of the organs of respiration continues to exceed the usual amount at this period; the deaths in this class were 124, while the corrected average is 98. Phthisis was fatal to 145 persons, which differs little from the estimated number The fatal cases included in the zymotic or epidemic class have risen from 205 in the preceding week to 218 in the last. In the aggregate 35 more than the average, though measles and hooping-cough are apparently rather prevalent. It was mentioned above that two persons died of privation. The following are the particulars of the cases:—At the workhouse, Whitechapel, on 21st June, a labourer, aged 60 years, died of "starvation." He was brought by the police from Angel-alley. At the London Hospital, on the 21st June, a labourer, aged 42 years, died of "exhaustion from privation." He was brought in by the police on the 19th inst. The following are the particulars of a case of cholera which was registered last week:—At 54, Hill-street, Walworth, on 20th of June, a carpenter, aged 60 years, died of cholera (14 days), chronic disease of the stomach (2 years). Certified by medical attendant

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean daily reading of the barometer was above 30 in. on every day after Sunday; and the mean of the week was 30 032 in. The mean daily temperature was below the average of corresponding days as derived from the observations of ten years, on Sunday, Monday, and Tuesday; and on the four following days was above the average, the excess on the 26th being 6 deg. above the respective averages. The mean temperature of the week was 62·3 deg. The wind was for the most part in the north-west on the first three days: it then changed to south-west, but was frequently calm during the rest of the week.

The Royal Thames Yacht Club's match for a very handsome silver cup, and highly prized by the members, to support the colours of this distinguished club, will take place on Tuesday next, the 8th instant, instead of the 9th, as originally announced, owing to the grand City entertainment.

On Tuesday, a poor little boy, caught by the morning shower in Hyde Park, took shelter under one of the old trees in the park, near the east end of the Crystal Palace, and one of the decaying branches giving way, and falling on him, he was struck down and dreadfully crushed. He was immediately taken up by the police, and conveyed in a cab to the Middlesex Hospital.

On Monday, an old man, named Thomas Cross, formerly a farmer, being destitute, went to the house of his daughter, at Warton, Westmoreland, and as they were unable to find room for him to sleep in, upon which he left the house, and drowned himself in a canal over which he had to cross.

It has hitherto been the custom for the anniversary of the Watermen and Lighterm'n's Asylum to be celebrated in the second or third week in June; but, on account of the great influx of visitors to the City on the Lord Mayor's show, owing to the great influx of strangers to London, and the Great Exhibition, he has been unable to fix a time for the festival prior to the 1st of August, when Doggett's coat and badge will be rowed for.

By this week's arrival from the United States, we have advices from Jamaica of the 13th ult. We regret to learn that the cholera had broken out again, particularly in the neighbourhood of Westmoreland and Falmouth, and that the deaths resulting therefrom were numerous in other respects the islands were healthy, and much rain had fallen.

The new Middlesex Lunatic Asylum at Colney Hatch, of which the first-stone was laid on Wednesday, the 15th May, 1849, by his Royal Highness Prince Albert, was inaugurated on Tuesday by the Lord Bishop of London, assisted by some of his clergy, and in the presence of several magistrates.

It is stated that the Messrs. Fairbairn are constructing the engines which are to run express trains between London and Birmingham in two hours and a half. The driving wheels are to be seven feet in diameter, and the tanks of the tenders are each to hold 2000 gallons of water; so that, if necessary, the engines can run sixty or seventy miles without stopping for water.

Several new cabs, with "*Cab de sureté, breveté*," conspicuously painted on the panels, made their appearance on Tuesday, for hire, in the neighbourhood of the Crystal Palace.

SAN FRANCISCO IN 1851: WITH YERBA BUENA ISLAND.

FIRE AND EARTHQUAKE AT SAN FRANCISCO.

During the brief period of the organized existence of the Californians, their history has been a constant succession of checks and catastrophes, all of which they have undergone and overcome with a patient energy which nothing seems able to subdue. We have now to record a most destructive calamity which has just befallen the city of San Francisco, and laid 1000 of its buildings in ruins. The details of the catastrophe were received by the *Pacific* on Tuesday.

The *Alta California* says:—"About eleven o'clock on the night of May 3d, a fire commenced in a paint-shop on the west side of Portsmouth-square, adjoining the American. It was but a slight blaze when first seen, but in five minutes the whole upper story was full of flame. Before the engines could get upon the ground and commence playing, the American on one side, and a store occupied by Messrs. Rhodes as a furnishing establishment, were in flames. The buildings in the vicinity being all of wood and extremely combustible, the fire spread up Cary-street back towards Sacramento, and down Clay towards Kearney, with fearful rapidity. It soon had full command, and the fire department could only work upon the borders, and endeavour to check its progress by anticipating it. In this they succeeded on the north side before it reached Dupont-street. But in every other direction in which it could spread it took its own course. To the south, it spread to Bush-street; and all five o'clock A.M., it passed Jackson-street, sweeping everything from a little east of Dupont to the wharves. The blocks between Dupont and Kearney-streets, west of Portsmouth-square, as far as Bush-street, three in number, are in ashes. Between Bush and Jackson, Kearney and Montgomery-streets, five in number, all down. Beside these thirteen blocks, almost every building of which is destroyed, there are many others. More than three-fourths of the business part of the city is nothing but smouldering cinders. Scarce a fire-proof building in the whole burnt district has stood the test. Such as have, are the California Exchange, El Dorado, Verandah, in Portsmouth-square; and the buildings of Captain Howard, in which was the United States Assaying Office, of Moffat and Co., in Montgomery-street.

"The shipping in the harbour escaped providentially the fate which for hours seemed inevitably to await them. But, by breaking up the wharves, and cutting off the connexion, the progress of the fire was checked at Battery-street. The only vessels burnt were the *Niantic*, the *Apollo*, and *General Harrison* storeships, which were a long time ago hauled in, and built upon close to high-water mark. The city has since extended far beyond them, and had left them, as it were, in the heart of the town.

"Almost everything seemed to combine to effect the ruin of the city. The chief engineers and numbers of firemen were at Sacramento; there was almost an interregnum in our city government; the old council had adjourned, and felt no disposition to assume any responsibility in tearing down buildings; the new council had not been sworn into office, and had no power; some of the engines lacked sufficient hose; water was not abundant; the winds blew like furies, and in various directions; and there was generally a want of concentrated effort.

"Nearly every building within a distance of over a mile north, east, and south-west, by half a mile from north-west to south-east, is destroyed. Eighteen large squares, except a few buildings, and large portions of five or six others, have been completely destroyed. Several persons fell dead from over-exertion and excitement during the fire."

The energies of the people have not, however, been depressed by this great calamity. Within a week the buildings began to rise upon the burnt district, and every portion was alive with mechanics. "Instead of gazing at the ruins, and mourning their losses," says the *Pacific News*, "our business men generally have again entered the lists of competition for trade with all the energy of former times. The appearance of our city was never more animated, though the ties is of a somewhat different character from that which marked it ten days since. But we are going forward, and but a few months will elapse before nearly every trace of the recent disaster will have disappeared."

To this frightful catastrophe we have to add, that on May 15 the whole city of San Francisco was startled, about twenty minutes past eight o'clock in the morning, by a low rumbling sound, accompanied by a shaking and trembling of the buildings, caused by a severe shock of an earthquake. Some of the houses were thrown back and forward a distance of one foot. For a minute the central part of the city presented a scene of confusion. Thousands ran from the buildings into the street. The Plaza was covered with persons from the surrounding buildings. Many of the brick houses also were violently shaken, as were the *adobes*. The shock was felt most sensibly at the Lagoon, a distance of nearly two miles. In some instances, so great was the vibration, that persons in attempting to run found the same difficulty as is usually experienced on shipboard at sea."

The accompanying View we have just received by favour of a Correspondent. It shows San Francisco, with Yerba Buena Island in the distance.

This island is 2½ miles distant from the main land. It is a lovely spot, and clothed with wild verdure and luxuriant flowers, goats in great numbers, and romantic nooks and bays. It is proposed to convert Yerba Buena into an elegant watering-place, between which and the city there is to be a ferry steamboat.

NAVAL AND MILITARY INTELLIGENCE.

His Excellency Lieut.-General Sir Richard Armstrong, C.B., lately appointed Commander-in-Chief of the Forces at Madras, included by Major George Talbot, of the 43d Light Infantry (Military Secretary). Lieut. Robe ts, A.D.C., and suite, left town at an early hour on Monday morning, by the South-Western Railway, for Portsmouth, and embarked immediately on board the ship *Barham*, for that Presidency. Major Talbot only arrived in England on the previous Monday from Canada, having been in that country since 1839, without coming home on leave.

TROOPS FOR THE CAPE.—The authorities at the Horse Guards have forwarded instructions to Madras and the Mauritius for the embarkation of the 31st Light Infantry, and the reserve battalion, 12th Regiment, for the colony, along of her Majesty can spare that he requires further reinforcements to act on the offensive against the Kaffirs.

THE COMMAND IN THE MEDITERRANEAN.—The report that Admiral Dundas is to take the first command in the Mediterranean is said to be unfounded. Rear-Admiral Sir Edmund Lyons, at present Minister at Stockholm, is stated to be the fortunate rival of Admiral Dundas. Admiral Harvey, superintendent of Malta Dockyard, being senior to Sir Edmund Lyons, will probably be appointed to the command in the Baltic, Sir James Stirling obtaining the command at Malta vacated by Admiral Harvey.

MILITARY ESTABLISHMENTS IN THE ISLAND OF CEYLON.—The total amount advanced from the Colombo Treasury to the Deputy Paymaster-General of Queen's troops in Ceylon, in the year 1849, was £51,698; and the total expense incurred in the department of her Majesty's Ordnance during the same period was £15,597.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The comparative novelty of a loan on behalf of the Sardinian Government was published on Monday. Hitherto, the French Bourse has furnished the loans required, and the dividends have been paid with punctuality. The amount of the loan is to be £3,600,000, at 5 per cent. Interest, to commence from the last of June, with a redemption fund of one per cent., beginning in 1860. The proposed price is 85; and instalments at 20 per cent. will be payable on the 21st of July, August, September, October, November; and 15 per cent. on the 1st of December.

The Money Market has been easier within the last few days, and discounts, consequently, are a turn lower.

Payment of the dividends to the public will commence on Wednesday next, the 8th instant.

The Consol Market has not been firm during the week, although money is more plentiful, and the amount will be shortly increased by the payment of the dividends. On Monday the opening quotation was 97½ to ¾, but a decline of ¼ was afterwards marked, which was followed by a heavy market on Tuesday, and a further decline. Increased confidence gave, however, a better tone to dealings on Wednesday, and 97 to ¾ was quoted. The market on Thursday was firm, but not so good as on the previous day. In the price of the Unfunded Debt an improvement will be remarked, and Indian Bonds have also shown an upward tendency. With Reduced and New Three-and-a-Quarter per Cents business has been limited. At the close of the week the Market was firm, at the following rates:—Reduced, 97¼; New 3½ per Cent. Annuities, 98¼; Long Annuities, to expire January, 1860, 7 7-16; Ditto, 30 years, October 10, 1859, 7 4-16; India Bonds, under £1000, 50 pm.; Ditto, for Account, 97½; Exchequer Bills, £1000, 50 pm.; £500, 50 pm.; Small, £50 pm.

Business in the Foreign House has been limited. Spanish Five per Cents have, however, improved in price, and a rise of 3 per cent has occurred in Peruvian. Mexican has not materially varied, Danish and Russian Stock continue firm. The market at the close of the week was dull from absence of transactions, quotations being, for Brazilian Bonds, Five per Cent, New, 1839 and 1838, 89; Ceylon Bonds, Six per Cent., 105; Danish Bonds, 1825, Five per Cent., 103; Mexican Five per Cent., ex Jan. Coupons, 24½; Ditto, Account, 24¼; Peruvian Bonds, Five per Cent., Account, 90½; Ditto, Deferred, 43½; Portuguese Five per Cents, 86¾ x d.; Ditto, four per Cents., 34½; Russian Bonds, Four-and-a-Half per Cent., 100¾ x d; Spanish Five per Cent., 1840, 21½; Ditto, Account, 21½; Ditto, Passive, 6½; Venezuela Bonds, Two-and-a-Quarter per Cent., Account, 33; Dutch, Two-and-a-Half per Cent., 12 Guilds, 59¾.

Railway stocks continue heavy, and the dealings few. On the leading lines the increased traffic of the week has again been very large, but without having the slightest effect in checking the downward tendency of prices, which, at the close of the week, are for—

ORDINARY SHARES AND STOCKS.—Aberdeen, 11¾; Ambergate, Nottingham, Boston, and Eastern Junction, 4¼; Caledonian, 7¾; Eastern Counties, 1¼; Chester and Holyhead, 17; East Anglian (£25 paid), 3; Eastern Counties, 0¾; East Lancashire, 14¾; Edinburgh and Glasgow, 20½; Great Northern, 17⅝; Great Western, 53¾; Do., £17, 18½; Lancashire and Yorkshire, 92; Do. Fifths, 9¾; Leeds and Thirsk, 13; London, Brighton, and South Coast, 94; London and North-Western, 122½; Quarters, 20¾; London and South Western, 83¾; Manchester, Buxton, and Matlock, 1¾; Manchester, Sheffield, and Lincolnshire, 26½; Midland, 45¾; North British, 6¾; North Staffordshire, 8¾; Oxford, Worcester, and Wolverhampton, 18¾; Shrewsbury and Birmingham, Class A, 8¾ ex. Shrewsbury and Chester (Oswestry), 10; South-Eastern, 23; York, Newcastle, and Berwick, 19¾; Ditto, Extension, 14¾; Ditto, G.N.E., Purchase, 6¾; York and North Midland, 19.

LINES LEASED AT FIXED RENTALS.—Buckinghamshire, 18; East Lincolnshire, 93¾; Gloucester and Dean Forest, 21½; West Valley Guaranteed, 24¾; Wilts, Somerset, and Weymouth, 40¾.

PREFERENCE SHARES.—Eastern Counties Extension, New Six per Cent. Stock, 10¾

FOREIGN.—Boulogne and Amiens, 10¾; Namur and Liege, 6¾; Northern of France, 15¾.

THE MARKETS.

CORN EXCHANGE.—Owing to the favourable accounts in reference to the crops, and the continuous arrivals of foreign wheat and flour, the demand for all kinds of wheat of home produce in our market has ruled heavy this week, at a decline in the quotations of from 1s to 2s per quarter, at which clearances have not been effected. Foreign qualities have sold heavily, at the same amount of depreciation; whilst the supply for floating cargoes has fallen off. No high-bch barley has come forward, and the supply of foreign has not been large. The business has been confined to retail parcels, at late rates. In oats, we have very few transactions to report. Oats have moved off slowly, but no further decline has been submitted to in value. In beans and peas, no change has taken place; but Indian corn has given way fully 1s per quarter. The flour trade has ruled tolerably firm.

English Wheat, Essex and Kent, red, 38s to 42s; ditto, white, 39s to 43s; Norfolk and Suffolk, red, 33s to 42s; ditto, white, 35s to 45s; rye, 24s to 27s; grinding barley, 21s to 23s; distilling ditto, 23s to 25s; malting ditto, 25s to 31s. Norfolk and Lincoln malt, 46s to 54s; brown ditto, 41s to 47s; Kingston and Ware, pale malt, 54s to 56s; Chevalier, 54s to 58s; Hertford and Lincolnshire feed oats, 19s to 21s; potato ditto, 21s to 23s; Yorkshire and Cork, black, 19s to 21s; ditto, white, 20s to 22s; tick beans, new, 27s to 29s; ditto, old, 29s to 31s; grey peas, 27s to 29s; maple, 28s to 31s; white, 27s to 29s; boilers, 29s to 31s per quarter. Town-made flour, 32s to 37s; sacks, 24s to 28s. Stockton and Yorkshire, 27s to 31s per sack.—

Foreign. Danzig red wheat, —s to —s; white, —s to —s; barley, —s to —s; oats, —s to —s; beans, —s to —s; peas, —s to —s per quarter. Flour, American, 20s to 23s per barrel; Canada, —s to —s per sack. French, 29s to 31s per sack.

Seed Market.—So little business is doing in this market, that the quotations are almost nominal.

Linseed, English, sowing, 60s to 63s; Baltic, crushing, 56s to 59s. Mediterranean and Odessa, 54s to 57s. Hempseed, 35s to 36s per quarter. Coriander, 16s to 24s per cwt. Brown mustard-seed, 8s to 10s. white ditto, 9s 6d to 12s 6d. Tares, 4s 6d to 4s 6d per bushel. English rape-seed, new, £25 to £27 per last of ten quarters. Linseed cakes, English, £7 0s to £7 10s; ditto, foreign, £6 0s to £7 5s per 1000. Rapeseed cakes, £4 5s to £4 10s per ton. Canary, 50s to 56s per quarter. Rape oil, extra, new, 36l; ordinary, —l to —l; extra, —l to —l; white, —l to —l; extra, up to —l. Foreign, red, —l to —l; extra, —l to —l; white, —l to —l; extra, —l per cwt.

Bread.—The prices of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5½d per 4lb. loaf.

Imperial Weekly Average.—Wheat, 42s 4d; barley, 25s 2d; oats, 18s 3d; rye, 28s 11d; beans, 34s 1d; peas, 29s 2d.

The Six Weeks' Average.—Wheat, 40s 9d; barley, 24s 5d; oats, 20s 7d; rye, 28s 3d; beans, 30s 6d; peas, 27s 7d.

Duties.—Wheat, 1s 0d; barley, 1s 0d; oats, 1s 0d; rye, 1s 0d; beans, 1s 0d, peas, 1s 0d.

TEA.—About 800 packages have been disposed of by public sale this week. Most black qualities sold at previous rates, but low green parcels appear to be 1d per lb. Privately, common sound congou is quoted at 9½d to 10½d per lb, with a full average supply on offer.

SUGAR.—Fine grainy raw sugar has sold at previous rates, but the middling and inferior samples have had a downward tendency. Low middling to good yellow Mauritius has realised 35s 6d to 36s; low to fine Benares, 36s to 42s 6d; fine pearly yellow Madras, 44s 6d to 45s 6d per cwt. Refined goods have had a dull inquiry, at 47s per cwt for brown lumps.

COFFEE.—About 500 bags good ordinary native Ceylon have sold at 32s per cwt, but the business done is unimportant. Most parcels kinds move off slowly, at late rates.

RICE.—Nearly 2,000 bags fine new sold to the trade, now held at 11s per cwt; good ordinary white, 10s 6d per cwt.

PROVISIONS.—Irish butter is very low in cask, at in most instances, a decline in the quotations of 2s per cwt; Waterford, 62s to 72s; Cork, 70s to 78s; Limerick, 60s to 68s per cwt. Dutch butter, 8s per cwt lower. English qualities are dull at late prices, fine weekly. Bacon, 54s to 56s mid, 60s to 70s; Jowls, 46s to 50s per cwt fresh, 7s to 10s per dozen lb. Irish bacon supports last week's currency. Waterford singsdoe, 48s to 56s; heavy, 36s to 42s; middle sides, 36s to 50s per cwt. Lard firm, at 56s to 61s for Waterford, Bandford, and 48s to 50s Cork kegs.

Potatoes.—For the time of year, our market is steady, at full prices. P Y C, on the spot, is quoted at 37s 6d per cwt. Town ta-low, 3s 6d per cwt, no cash; rough fat, 2s per 8lb.

Oils.—General y speaking, the demand is in a very inactive state, but no further decline has been submitted to in the quotations.

Spirits.—East India rum is in fair demand, at 1s 3½d to 1s 4d proof. Leewards, 1s 4d to 1s 5d proof, with a steady inquiry. Brandy comes off freely, but no advance has taken place in prices. Geneva dull, at 1s 7d to 1s per gallon.

Hay and Straw.—Meadow hay, £3 5s to £4 0s; clover ditto, £3 10s to £4 10s; and straw £1 to £1 15s per load. *Trade firm*.

Coals.—Hadlow's West Hartley, 12s 6d; Cleaver Main, 12s 6d; Redheugh Main, 12s; Wylam, 13s 3d; Braddyll, 14s 6d. Eden Main, 12s 3d; Ke hoe, 14s per ton.

Hops.—The demand has slackened, and most qualities are offering at less money. Duty £100,000

Wool.—Our market still rules are a singly inactive, and low parcels of both foreign and colonial are easier to purchase.

Potatoes.—The season for old potatoes is now closed. New ones are steady, at from 6s to 13s per cwt.

Smithfield.—On the whole a fair amount of busine s has been transacted in fat stock this week, on the following terms:—

Beef, from 3s 4d to 3s 6d; mutton, 3s 6d to 3s 10d; lamb, 4s 0d to 5s 6d; veal, 2s 6d to 3s 6d; pork, 3s 4d to 3s 8d per 8 lb, to sink the offals.

Newgate and Leadenhall.—Owing to the hot weather, the markets have been very scantily supplied, whilst the demand has ruled inactive, at but little alteration in prices per

Beef, from 2s 8d to 3s 6d; mutton, 3s 4d to 3s 8d; lamb, 3s 8d to 4s 10d; veal, 3s 6d to 4s 6d; and pork, 3s 2d to 3s 6d per 8 lb by the carcase.

H. HERBERT.

ADVERTISEMENTS.

ALYESBURY PARISH CHURCH.—The Committee for the Restoration of this Venerable Church feel themselves compelled to appeal for further aid in completing their undertaking, which is now in a state of forwardness. A sum of £4000, chiefly raised by parish rate, and partly by voluntary subscription, has now been expended; but a further sum of £700 is required to complete the work in hand, which includes the provision of additional church accommodation in a populous town, and the due restoration of a noble monumental edifice. Subscriptions for this purpose are very earnestly requested, and may be paid into the Oxford, Aylesbury, or the London and County Bank, Aylesbury, and London (see next at Messrs. Prescott, Fleet-street, to the account of "The Aylesbury Church Restoring Fund." Aylesbury, June 19, 1851.

The German Language—Herr Löwenstein
Landscape Drawing—Monsieur D F Surenne.
Fencing and Gymnastic Exercises—Monsieur Dancing—Mr John Syrotti.
The above Institution has been established expressly with the view of affording to a limited number of Pupils an education equal in all respects, and, in many, superior in some to that of the Public Schools of England; nor has any care or expense been spared to secure the establishment of this object.
Pupils destined for the Universities are trained thoroughly in Classical Literature, while the education of others is considerably modified with a view to their future pursuits. Parents and Guardians being paid to be particularly of Pupils for the Army.
The study of the Modern Languages forms a prominent feature in the general course, and is taught on the Conversational Method.
Dr Humphreys, Author of the "Exercitatio ne Iambico," &c., has had arranged with Ministers of other Churches in Edinburgh to attend, at the request of their respective parents, Pupils of Presbyterian Parentage.
The entire system of the School has been arranged with a due regard to each of the three great elements of sound education, so that while the Intellectual is duly put position, the Moral and the Physical are also carefully attended to.
Posts of honour, good and Rabbit-houses are allotted to each of the Pupils as their own.
The Pupils are at all times under the super-intendence of the Masters, at the Hours of Meals, Recreation, and Study, and for the sake of health, the establishment being supplied with hot, cold, and shower-baths, and with patent conveniences in the rooms.
Vacations Three Weeks at Christmas, Ten Days at Easter, and Six Weeks at Midsummer.
Prospectuses and further particulars to be had on application to the Head Master, Salisbury House, Edinburgh.

METCALFE and SON'S NEW PATTERN DOUBLE-BED SPRING MATTRESS, with Patent Tie-in-Sprah searches thoroughly into the divisions, and cleanses them in the most effectual manner; it has never come under the notice of the public, uniting Hair-brushes, with the durable and elastic Russia Bristles, which will not entangle the coverlet, and the Patent Cocoa-nut Fibre that cleans harmlessly from the Bristles. An extensive stock of genuine and unbleached Russia sponges, at METCALFE, BINSLEY, and SON'S, 97, Regent-street, corner of Vigo-street, and 57, Cornhill. Metcalfe's Alkaline Tooth Powder 2s per box.

THE PRICE of ARTIFICIAL TEETH, 1851, is now changed and will be as follows:—Messrs. GABRIEL, Dentists, of 15, Finsbury-square, Regent's-park, are very easy to wear: his charge for any number, only 10s 6d per tooth not two for 20s: they should be strongly recommended to all who have lost their teeth (as they are of beautiful colour and break—an endless expense). Mr. B. sees patients every day from One o'Clock.

BEECH and BERRALL, 63 and 64, EDGEWARE-ROAD, will offer for Inspection, during the next ten days, a Limited Number of Pieces of SWISS and INDIA MUSLINS, BALZARINES, BAREGES, &c., at little more than half price Patterns sent to all parts (free of postage).—Address, BEECH and BERRALL, 63 and 64, Edgeware-road, London.

GRAND EXPOSITION of RICH and COSTLY SILKS, &c.—Chanticleer Stock.—2000 yards of rich Glacé Silks, Flounced Pieces of SWISS and INDIA MUSLINS, BALZARINES, BAREGES, &c., at little more than half price Patterns sent to all parts (free of postage).—Address, BEECH and BERRALL, 63 and 64, Edgeware-road, London.

GRAND EXPOSITION of RICH and COSTLY SILKS, &c.—Chanticleer Stock.—2000 yards of rich Glacé Silks, Flounced Pieces of SWISS and INDIA MUSLINS, BALZARINES, BAREGES, &c., at little more than half price Patterns sent to all parts (free of postage).—Address, BEECH and BERRALL, 63 and 64, Edgeware-road, London.

NEW MUSIC.

ENGLAND'S INVITATION to ALL NATIONS.—The SONG of the EXHIBITION Poetry in English, French, and German, with a beautifully Illuminated Title-page The charming and appropriate composition is universally admired, and dedicated by the Song of the Season
Sold by CRAMER and Co, Regent-street; and all the principal Musicsellers.

BELLINI'S "SONNAMBULA," Pianoforte Solo.—A new and complete edition is this day published, beautifully engraved and printed, price 4s., forming No. 8 of BOOSEY'S ILLUSTRATIONS of OPERAS, by permission and dedicated to [illegible] "Sonnambula" are those published by BOOSEY and Sons, whose name has been instituted against the publishers and vendors of all others.—28, Holles-st.

SOVEREIGN OF ALL!—Now ready, price 2s. Fourpence, handsomely printed in Gold and Colour, HYMN for the QUEEN, and HOMAGE to all NATIONS: a contribution to the Great Exhibition of 1851. Dedicated to JOSEPH PAXTON, Esq., by the Author. Published by JAMES NISBET and Co., Berners-street; and sold by JOHN MASON, 66, Paternoster-row, and all Booksellers.

Music to the Hymn, by H. L. LAVENU, price 2s.; CRAMER, BEALE, and Co., Regent-street.

Profits in Lieu thereof to the aid of Ragged Schools.

GREAT EXHIBITION MUSIC.—L'Enfant Prodigue, Fadaise, Sonnambula, Norma, La Figlia, each 2s; Le Prophète, Huguenots, Lucia, Favorita, each 4s; Zauberflöte, Don Giovanni, each 2s; and Rossini's Overtures for Piano, 4s each; Grand Exhibition Quadrilles, and Quadrilla of all Nations (two sets) and Paxton Polka, all for 2s; also, the Twelve Crystal Fairies, Waltz, 2s.—"This music—so excellent, yet so cheap, so correct, and so beautifully engraved and printed—surprises and delights all who see it."—Globe. Sold wholesale and retail at the Office, 97, Paternoster-row, and 16A, Argyll-street, Regent-street. Catalogues gratis

MISS CATHERINE HAYES and Mdlle. JENNY LIND.—The most favourite ENGLISH BALLADS sung by these accomplished artistes "I'll be always with me," by Maynard; "Why do I weep for thee?" by Wallace, and "Oh, my home," by Balfe, "Memories," sung by Miss Dolby; "Home, sweet home," by Bonedict; "Grummer morn," by Meyerbeer; and "The Lonely Rose," by Balfe, may be had of Miss Dolby.
CRAMER, BEALE, and Co., 201, Regent-street.

OPERA.

OPERA.—Her Majesty's Theatre and the Royal Italian Opera, Covent Garden.—The Opera Hats, and Boxes at CLARK'S, 49, Bedford-st, and CO 'S, 201, Regent-street.

PIANOFORTES.—CRAMER, BEALE, and Co. have the best of every description, English and foreign, new and second-hand, for sale or hire.—201, Regent-street, and 67, Conduit-street.

PIANOFORTES at Manufacturing Prices.—Messrs. HOLDERNESS and Co., 444, New Oxford-street. Lists sent free by post. Pianofortes for hire, for three years, with option of purchase. Every description of Pianoforte in rosewood cases, 7½ octaves, and warranted, 18 guineas. Ditto, with the new check action, 20 guineas. Ditto, with the new check action, and fluted cases, 22 guineas. Ditto, with the same case and 6 octaves, but less height and consequently more convenient for cottages, 25 guineas. Ditto, with the new check action, and fluted cases, 27 guineas. A variety of second-hand by Broadwood, Collard, Allison, and other makers from £16 to £40. Ditto, with portable Harps, by Erard, from £10.—N.B. Every description of music, instrument tuned, repaired, and taken in exchange.

GREAT EXHIBITION, Central Avenue.—An Illustrated Priced List of CHURCH FURNITURE published by GILBERT J. FRENCH, Lancaster, transmitted free by post, on application. Parcels delivered in London daily

CARRIAGE DRAWINGS.—WILLIAMS and SON, 3 and 4, Long-acre, having engaged upon their own premises some years, and under the immediate superintendence of a practical coachmaker, are now enabled to offer the public the result of their labours, combining, as they conceive, all other makers from £16 to £40. Ditto, with bugle 5 0 0 Ditto, with bugle 5 0 0 beauty, durability, and elegance of construction, at moderate charges. Their Carriages are now exhibiting in the Great Exhibition, Class 5, No. 37 in the Catalogue, and may be viewed only at Charles Gleiny's Balbriggan Warehouse, 83, Cornhill-street.

NUMBER ONE, ST. PAUL'S CHURCHYARD.—Purchasers of GROUND COFFEE are most respectfully informed that the Public Analysts continue to supply it pure, or mixed with chicory, as may be desired: and that, in order to prevent the fraud of substituting spurious packages of ground coffee is marked "Pure Coffee."—Dakin and Company, Tea Merchants and Importers Roasting Coffee in Silver Cylinders, Number One, St. Paul's Churchyard. Sold in packets, and on commodious terms, for consumption in their railway expenses by purchasing their teas and coffees at Number One, St. Paul's Churchyard.

ANCIENT and MODERN COINS, MEDALS, &c.—Mr. C. R TAYLOR solicits the attention of Collectors and Others to his extensive Stock of the above Articles, which may be purchased at his residence, 3, Keppel-street, Russell-square. Coins, Medals, &c., purchased for London-bridge; Jersey, Castle-street, Liverpool; and all Ironmongers.

IMPROMPTU DINNERS.—At Ten Minutes' Notice, a first-rate Dinner, consisting of Soup, Fish, a Rôti, and a Pudding, may be had at the Establishment of MESSRS. CROSSE and BLACKWELL, Purveyors of Sauces and Pickles, and manufacturers of HOUSEHOLD PROVISIONS, which are the closest productions of the Laboratory that the Chemist can produce, and put up in gum-cannisters, so as to retain their freshness and flavour for an indefinite period. Soups, Gravies, Sauces, Pickles, Potted Meats, and nearly a hundred different Articles, &c., always on sale To be had of Porters and Mason; Morel, Brothers, Piccadilly; Crosse and Blackwell, Soho-square; Fortnum and Mason, Piccadilly; and Grocers and Oilmen generally. Purveyors to Her Majesty, Their Royal Highnesses Prince Albert, Prince of Wales, Princess Royal, Duchess of Kent, Duke of Wellington, Cavendish-square, C. Wix and Sons, Londonbridge, J. Whitmell and Co., corner of Peascod-street, York; and of the principal Italian warehousemen and grocers throughout the kingdom. Sample Dinners, for each, containing one ingredient, forwarded to any part of the kingdom by Messrs. Ritchie and M'Ca, 1, Princes-street, Edinburgh, on receipt of a post-office order for the sum of 1 Price Lists forwarded post free on application.

GRAND EXPOSITION of RICH and COSTLY SILKS, &c.—CHANTICLEER STOCK.—2000 yards of rich Glacé Silks, Flounced Pieces of SWISS and INDIA MUSLINS, BALZARINES, BAREGES, &c., at little more than half price Patterns sent to all parts (free of postage).—Address, BEECH and BERRALL, 63 and 64, Edgeware-road, London.

JEWELLERY.—DODD BROTHERS, 40, CORNHILL, Mansion House side, beg to solicit an inspection of their extensive assortment of GENTLEMEN'S and other articles in Jewellery, forming a Class of the Chalybeat Exhibition, Crystal Palace, Machinery, Bracelets, Hoop Ear-rings, &c., to be met with in London.—Watchmakers and Silversmiths in general, 40, Cornhill.

OAK CHESTS of Warranted CARPENTER'S WORK, 2 feet 6 inches wide, 2 feet 3 inches deep, and 3 feet high, at the following reduced prices. A printed list of the contents of each chest may be had on app lication.—No. 1, Fee: No. 2, 30s. No. 3, 40s. No. 4, 50s. No. 5, 60s. No. 6, 70s. No. 7, 80s. No. 8, 90s. No. 9, 100s. Strong Kuitgrass' Chests, complete, 47 10s. Kuitgrass' mattresses, 10s. Kuitgrass' Pillows, 2s. Kuitgrass' Bolsters, 4s. Hundles of every description.—Address, S. and J. S. BLIGH, 7, Barrett-lane, Wood-street, London (established 1805). Post Cash Orders promptly executed

IMITATIVE CAMEO WAFERS.—By constantly using these Wafers, the eye becomes familiar with the use of forms of a beautiful character, and the taste is refined. They are copies, sold in sealed boxes, containing 50, 5s. May be ordered of all Stationers, &c., and of the Inventor, Mr. Jaygood, 4, Mansfield-street, A fact Cottage, Weybridge Common, Surrey. No. 509, Class 29, Miscellaneous, bought last Tuesday, Exhibition for 1851.

A Sample of the Wafers may be had free by post.

DRESS COATS, of extra Saxony cloth, three guineas; frock £3 10s. First-class garments in every respect, such as must assure unqualified approval, for which a reputation for supplying superior articles has been established for twenty years, at the Original Establishment for Ready-made Clothing, No. 69, Regent-street, corner of Vigo-street. Also, the largest and most varied assortment of ready-made clothing in the Great Exhibition, Class 30, No. 37 in the Catalogue, sold only at Charles Glenny's Balbriggan Warehouse, 83, Cornhill-street.

GLENNY'S BALBRIGGAN STOCKINGS, [illegible] [illegible] [illegible]

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS.

No. 499.—Vol. xix.] SATURDAY, JULY 5, 1851. { Two Numbers, 1s. WITH HALF-SHEET SUPPLEMENT GRATIS.

THE GREAT EXHIBITION.

GENERAL AND MISCELLANEOUS MODELS.

The art of modelling, as applied to landscape, is one which we believe to be susceptible of more improvement and more advancement than is generally considered possible. It has never yet been treated as an art, and it has been in general only pursued as a matter of individual whim by scattered members of that ingenious body of amateur wielders of their fingers who are continually producing specimens of that class of nondescript articles which we admire for their ingenuity, and very often not the less for that ingenuity having been singularly misplaced. The tribe of industrials to whom we refer are the cunning workmen who love to astonish the world by constructing either anomalous objects, or commonplace objects made of anomalous materials. One genius will arrange shells into the shape of fruit or flowers. Another—and he has sent his work to the Exhibition—will construct such a monstrosity as a ship fully rigged -her ropes, sails, and spars all cut out of cork. Again, we shall have a cunning workman carving wonderful things out of pith, or shaping a lamp, which is the rapturous admiration of the neighbouring provincial journal, out of a turnip. Anon, we find a man devoting his life to writing the Lord's Prayer and the Ten Commandments within the compass of a fourpenny bit; while his neighbour in these unappreciated arts sends up to the Queen, as an appropriate present, a walking-stick, carved all over with the figures of the Zodiac, or a scene from "Paradise Lost;" or, perhaps, a wonderful watch, containing a snuff-box; an almanack; a set of toothpicks; directions for the preservation of health; and a fleam for bleeding horses. Any attentive reader of the newspapers—and who is there who is not?—will recognise in a moment the class of nondescript ingenuity to which we refer. The neat-handed monstrosities thus produced generally attain an immortality of a fortnight or so, while the laudatory paragraph goes the rounds, until they are supplanted by some more recent and even still more wonderful intelligence touching an enormous gooseberry, or a shower of frogs, in a remote district of England. Now, what we want to enforce is, that modelling as applied to landscape, or to those degrees of the art which lie between raised map making on the one hand, and the representation of rocks and ruins and trees upon the other, has been in general only pursued by the class of nondescript industrials whose master-pieces we have characterised; and the natural consequence is, that the art, in its ordinary manifestations, is in a state of utter debasement and tasteless rudeness. Of this the Exhibition affords several curious proofs; amongst which we may mention at once a model of Tynemouth Priory and rock, which would have disgraced a sugar baker, and a model of a grand allegorical procession of the Shakesperian characters

WAITING HER MAJESTY'S ARRIVAL.

The above Engraving represents the waiting-room erected for the reception of her Majesty near the North entrance of the Building, having particular reference to the surrounding group of anxious spectators, on the occasion of the inauguration of the Crystal Palace, on the 1st of May. This elegant little apartment is chiefly composed of rich tapestry, the interior being lined with pale light blue and white silk, fluted. The furniture is of a very costly character, combining lightness of appearance with splendour of effect. The sofa and chairs are carved and gilt, and covered with light blue silk damask. The carpet of rich Brussels, is a flowered pattern. Flowers, tastefully disposed, add a pleasing and lively effect to the picture. In the rear of the principal room is a smaller apartment, separated from it merely by a draped partition, in which is a handsome cheval glass, in a gilt frame and stand. Crowds of persons daily thronged to view this little *bijou* of a boudoir, at a respectful distance however—a cordon being drawn around it, guarded by a policeman.

round the Stratford-on-Avon house, which, however well-intentioned, is, in point of art, one of the rudest and most Gothic productions we ever gazed at. The Exhibition, however, gives specimens of the art as pro mising as these are discouraging—specimens which confirm us in our opinion that great and very useful things may yet be accomplished by this means, and that it is calculated to be of essential service to the geographer, while it may also develop a new but perfectly practicable branch of art—that of representing landscape upon uneven surfaces and copying the effects of nature, not merely by means of light and shade, and colour, but by actually imitating in plastic material the inequalities and roughnesses of the country to be represented. Perhaps the most practicable mode of proceeding in the matter is to adopt, even by degrees, the usages of treating a landscape, the effect being to enable the artist to represent the major portion of the objects which he imitates of the same general size. The difficulty of modelling a landscape in which the foreground should be constructed upon a large scale, and the effects of foliage, for instance, adequately represented, contrasting with the middle and extreme distances, would, we fear, be insuperable. One or two attempts at it, exhibited principally in the German and Swiss departments, are wretched failures, hardly entitled even by courtesy to the name of works of art at all. A very different result, however, is obtained when the bird's-eye system has been resorted to by competent artists, both in the case of that marvellous urban model of Liverpool, and the not less marvellous, country and marine model of part of the back of the Isle of Wight. The bird's-eye principle is simply that of applying the map, or geometrical method, instead of the art or perspective method, to a model picture; and it is in the nice degree to which the one mode, with its picturesqueness, may be brought in to illustrate the minute accuracy of the other, that the perfection of this system of representing nature is to be sought. We want neither a map nor a picture, but something between the two—something which shall give us a real and ingenious representation of what we would see if elevated some hundred feet in the air, and ordering the scene to be presented. The advance we have been recently making in this species of art is testified by the introduction of these clever half-map, half-landscape pictures of cities, called by their French originators views "*en ballon.*" Adopting the principle of art as shown in these clever drawings, if we substitute the modelling tools for the pencil, and represent projecting and treating surfaces by means of solid material, we shall be realising a useful and ingenious method of miniature imitation, which as yet seems in its infancy. We have alluded to one of the best models of the Isle of Wight, contributed by Captain Boscawen Ibbetson, as a very favourable specimen of the correct application of the principle for the extended use of which we are pleading. Indeed, in many respects, the work seems perfect, and the illusion produced when gazing through the lower glass is equal to many a highly-puffed dioramic effect.

This very fine model is placed in the western part of the Nave, not far from Liverpool. It represents the coast line of the back of the Isle of Wight; the long double line of cliff surmounted by the undulating and rolling table land, which constitutes the higher general surface of the island. The spectator is supposed to be at sea, perhaps half a mile from the shore, and elevated to some height above the water. Moving, therefore, along the model, he sees a wondrously exact representation of what a sailor would see perched upon the topgallant mast of his ship, as in a calm day and summer weather she crept along the coast. The view extends from Shanklin along the south-westerly shores of the island. the scattered hamlets, cottages, and churches being represented with the greatest care and accuracy, and their reproduction strictly observed. To teachers of geology, models constructed upon this principle would be invaluable. They would be able to demonstrate, with the greatest convenience, the formation and geologic set and features of the district in question. They would remark, for example, the gradual rise of the formation of the coast line, which would apparently go to show that the sea had at one period flowed at a far higher level than at present, the phenomena being indicated by the fact that there are, with some accidental breakages, two distinct ranges of rocky declivity, one above and one the higher presenting exactly the same peculiarities as the lower; so that the sailor who might land upon the beach with the intention of getting to the top of this island, would first have to scramble up a steep rocky acclivity, and would then find himself on an undulating table land of ground, rising not so steeply but ranging backwards; while above it another stony ascent, of precisely the same form and appearance as the first, leads again to a renewal of the swelling, arable, or pasture country. in this instance forming the table-land of the island.

Looking along the model, we perceive that it is the middle belt of gently rising and undulating ground which is the most densely peopled and highly cultivated. Gentlemen's mansions, large farm buildings, clusters of cottages, and small hamlets, are ranging unsparingly in the little ravines and in the hollows of the slopes, and behind the sheltering knolls and irregularly running hills which form this pleasant belt of fertile land. The whole of it is enclosed; and any farmer from this part of the island might count the each and other's fields, exactly represented by the skill of the artist. The care and effort with which the fine of the country has been represented in its natural colours is very striking. The dark and tangled appearance of coppice and brushwood is very happily imitated. You see vegetation of the kind clinging round and clothing the rocks, and filling up the seams and crevices of the more precipitous banks of stone. In the arable ground again the bright green of the meadow is carefully distinguished from the pale yellow of the corn field, and both are represented in quite different fashion to the dark greenish brown expanses of the downs, and the heathy moors and wastes. The shingle and the beach, too, are capitally managed; the effects of successive patches of sand white and glistening, beds of grey shingle and low lying ledges of rock, littered with masses of dark green sea-weed, being all given with great taste and skill. In the same way rugged and uneven surface is represented partially by asperities in the surface of the model, partially by very clever painting in the dotty, blotchy style, the broad apparently dabbed hither and thither with reckless freedom of hand, but the effect altogether being marvellously real.

Near the view of the Isle of Wight is another and a remarkable model picture, partaking, however, more of the map than of the landscape nature—depending more upon geographical science than upon artistic decoration and imitation. We allude to the general map or painted model of what may be fairly called "Midland England." The representation delineates about 3000 square miles of country, including the whole or great portions of Nottingham, Leicestershire, Derbyshire, Yorkshire, Lancashire, Cheshire, and Staffordshire. In a work upon the very small scale on which it is obvious it is necessary to proceed in producing geographical models of great masses of country, only the bold and broad features of the district can be represented. The eye, instead of being arrested, as in the Isle of Wight, by steep and craggy banks—by the precipitous edge of the cliff—by the continuous division of the country into meadow, and corn field, and orchard, and garden, only follows the great chains of the hills, notes the lie and the communication between the valleys, traces the rivers up from their slow and useful course in the level country, to their head waters among the hill-notes, too, what unerring monitors these rivers are to the road-maker and the engineer, and how clearly, except in the cases where they flow zigzag fashion, in an absolutely level country, they point out the natural and obvious routes of communication. All these things are made far more manifest than a raised picture of this sort than on a map of three or four times the size. The eye catches the disposition and character of the country at once, and the geographical impression left is the more lasting, as it has been the more vivid.

The peak country of Derbyshire shown in this model is exceedingly interesting. The imagination kindles with the representation of the sharp ridges, the high-peaked hills, the deep recesses, the wide expanses of the coreys, and the close and dark ravines and gorges among which spring the head-waters of the Mersey on the one side, and the Trent on the other. The picture is certainly not picturesque in itself, and yet it is massy strongly in feeling and impressive. The mind at once leaps to the reality from the strong *point d'appui* given to it by the miniature representation, and you can feel what must be the beauties of those glens winding far up into the wilderness of the Derbyshire hills, and the glories of those rivers, the five, for instance, which unite near Sheffield—

Five rivers, like the fingers of a hand,

as Ebenezer Elliott wrote, and form one deep and solemn rolling stream, out of as many fierce and unbridled mountain torrents. The enormous difficulties which must have beset the construction of the Manchester and Sheffield Railway are well exemplified in this model. You trace the line running with curious accuracy along the most level bottoms of the glens, making its way from one valley to the other, through the narrowest necks of intervening obstacles, and, in spite of the difficult nature of the country, only plunging once into a very long and dreary tunnel. This excavation is, we believe, more than three miles in length. It was begun simultaneously at each end; and so exact and scientifically perfect was the progress of the workmen, that the two parties met exactly in the centre of the intervening hill. In the model before us, no houses are, of course, introduced; but small projections might have been employed to convey the notion of the towns, of which there are not less than 47 represented. Altogether, the work is a highly creditable one, and we doubt not but that it has given distinct topographical notions to many a spectator whose ideas upon the subject were previously anything but satisfactory. The model attracts great attention. Embracing, as it does, so considerable and important a portion of England, a great many visitors are pleased to recognise their own towns and villages; and the delighted exclamations relative to this river, that road, this canal, or that hill, showed how correct the work must be to be pleasing and satisfying to so many local critics.

The next model to which we have to call attention is one of quite a different nature, and belongs only to a department of the art which has been long and naturally practised, requiring very little artistic skill in its construction, but still useful as conveying a clear notion of the thing to be represented. Models of works of skill, it is evident, present none of the difficulties inherent to models professing to delineate natural objects What man has made upon a large scale he can make upon a small scale, while the effects of distance and the necessity for realising a material representation be at once dispensed with. The model in question is that of Plymouth Breakwater. It is constructed of limestone and marble—the limestone so roughened and moulded as to represent the sea—the marble doing duty for the gigantic wall opposed to its fury. The work represents the Breakwater as done at present, in a gale of wind. On the seaward side the waves run high, here and there making a clear breach over the obstacle, while behind it the water is comparatively calm, and only disturbed, as it were, by sympathy with the heaving and agitation beyond. The Plymouth Breakwater, as many of our readers are aware, although commenced in 1812, is yet very far from being finished. Upwards of £1,500,000 have been spent upon it, and nearly four millions of tons of stone have been flung into the sea. There seems, indeed, to be no likelihood of an end to the work. Hardly a heavy gale which sweeps up Channel which does not undo some portion of the work of construction. The force with which waves run was never more strikingly illustrated than in the progress of this great work. It is, indeed, even said that the Breakwater is now further up the Sound than it was in its original position—that the sea is continually flinging huge masses of stone, some of them weighing as much as from three to five tons, from the outward to the inward slope so that the ocean is actually and literally battering back inch by inch the obstacle opposed to it. The form of the work which exhibits the best angle found by experience to be the best in resisting the attack of waves. The sea wall slopes gently, with one foot of descent to five of breadth—the result being to break the body of a rolling sea and render it inoccuous, instead of, as in the case of a perpendicular wall, by a perpendicular or nearly perpendicular body opposed. Small sections of the work are exhibited, showing that the Breakwater is a deposit, not a construction, and that the blocks of limestone and masses of concrete, of which it is composed, have been merely thrown into their places from lighters anchored above. The central bulwark of the mole is about 1000 yards long: the two flanking portions, extending at a blunt angle back from the main structure—so as to form a sort of inward bay—are each 340 yards long; and within the shelter thus provided it is calculated that upwards of 60 line-of-battle ships could find refuge. The model is an extremely interesting one—as showing the present condition and uses of a great national undertaking—only second in extent to the vast mole, or *digue*, nearly opposite Plymouth, at the mouth of the harbour of Cherbourg, the constructing of which is one of the great monuments of enterprise and boldness left by Napoleon to France.

Passing still further to the west, we come to another model the celebrated one of Liverpool—certainly one of the lions of the Exhibition, and which is always surrounded by a ring of admiring spectators. To this work we have already directed attention, but viewing it in a light different from that in which we are now considering the subject. The work is perhaps one of the most remarkable efforts of ingenuity of its kind ever attempted. It belongs to the category of models most easily executed, as being representations of artificial, not natural objects; but its great elaboration, the mass of minute detail lavished upon the houses and shipping, the care and ingenuity with which the different classes of buildings are represented—the dirty houses of the crowded lanes and alleys, the bright and ornamented appearance of the lines of shops in the great thoroughfares, and the quiet and respectable air of the terraced residences in the suburbs all this proves the application of immense and skilful labour, directed by a great deal of ingenuity and method. We recommend the visitors to the model of Liverpool to go at first to either end of the work, and, having taken one or two-storied cottages as a guide, to look down as if he stood upon a hill or a high steeple, and looked down upon the city. The illusion, in fact, is as striking as that in the model of the Isle of Wight. He may imagine that he is gazing upon the outspread, streets, squares, and in the early brightness of a summer dawn, before the town has become canopied with its usual pall of smoke, and ere yet the moving masses of population attract the eye, and introduce a new element into the scene. An admirable painting of Liverpool *en ballon*, graces the model. The eye ranges from street to street, and block to block of building, and is struck with a curiosity which is never left disappointed, the wonderfully minute details of building and architecture. The very chimney-pots seem to have been represented; while the straggling and meanly-built suburbs, with their long lines of paltry one or two-storied cottages, are more and more then by timber-yards and gas-works, and factories of all descriptions, have quite another character to that displayed in the piled and stacked masses of lofty building, which form the crowded centre of the town, and down into which the long narrow streets seem to have been sunk, like ditches or ravines in the surface of stone and mortar. The illusion is kept up, too, by the great care and skill bestowed upon the models of ships in the docks and in the river. These little vessels are masterpieces of workmanship; and it may be observed that every one lying is invariably technically correct, and that specimens of craft of all possible classes frequenting the Mersey have been introduced from the flat which voyages up the stream to Runcorn, to the Yankee crack packet—from the Woodside ferry-boat to the large steamer lying moored alongside the new floating jetty, to the last constructed ocean steamer of the Cunard or the Great American line. Another happy idea was the representation of water not by a blue-painted surface, as is the case in the Isle of Wight model, but by a thin sheet of glass or mirror, which the models of ships have been neatly inserted. A slight objection, founded, however, only upon recollection, occurred to us as to the lay of the ground. We thought the site of the town made rather too flat, particularly the open expanse, which climbs to the ridge of a hill, the slope of which towards the water is covered with the long streets of the northern mercantile capital. There may be a point in which we, not the modeller, are in fault; and even if in this respect the work is not perfect, it must be accurate, it is still a noble specimen of persevering ingenuity, and a realised picture, probably unequalled in the world, of a great and many-featured city. Among the spectators we remarked many foreigners, who lavished all their surprise and admiration upon the docks and the endless arrays of shipping. The expression continually escaping from the lips of admiration, envy, and astonishment—"*Mon Dieu! quel commerce! quelle foule de batiments!*" afforded a very fair index to the impressions of our foreign friends, excited by this marvellous specimen of England's commercial greatness. One of the spectators, however, of Liverpool—and he was not a French man, but a respectably-dressed and seemingly well-to-do Londoner—we must specially signalise. This individual displayed one of the most curious and unaccountable degrees of unintelligence and stupid fatuity it was ever our lot to have developed. The man in the mistake for one of Liverpool for a model of London, and was pointing it out to two or three persons, who had evidently placed themselves under his sage guidance as an enlightened Cicerone to the Exhibition, as such; and was, moreover, making the consequent reminiscences of the Metropolis its prototype, London, to wit; and actually pointing out the principal buildings in Liverpool as those in London—taking St. George's Hall, for instance, as being St. Paul's, and the Custom-House (the architect would not have thanked him) for the Mansion House! Or no less a triumph of architectural genius than the National Gallery. Our enlightened friend went on to point out the lines of street as being the Strand, Fleet-street, Cheapside, Piccadilly, and so on; while his favoured audience stood gaping by, swallowing every word the wonderful stolidity of their friend prompted him to say. We never saw a more marvellously complete Exhibition of pure *bêtise*. The admirer of London, however, in Liverpool, was not the only curious instance of blundering we overheard. In the Nave there is a model of a very beautiful chain bridge erected by an English engineer over the Dnieper, in Russia. We were examining it, when two girls, smart young women, came up, and, after a pertinent remark or two had passed between them, one expressed her surprise at the construction of what she called the double bridge, and wondered why the people should want a separate roadway close to the water, when they had such a splendid one above—this double construction, which both the girls imagined they saw, being nothing more or less than the reflection, in the mirror which represents the river of the lower side of the real pathway!

Amongst the models of engineering works, which are of course very numerous, we may call attention, besides the very handsome bridge in question, to several other bridges for different purposes, and of different constructions, swing, tension, and suspension, for railways and the passage of ordinary road traffic. The neatness of handiwork in these models is remarkable; and in some of them, every bar and girder, every pin and coupling are made to scale, and specimens of them displayed beside the principal work. The bridge over the Dnieper is constructed like that of Hungerford, the chains being longitudinal plates of iron running parallel to each other, and the suspending rods being also solid masses of metal. a mode of construction far more strong and durable than the twisted wire system so much in favour in France. The larger rivers of the country, particularly in the south and west, the Rhone, for instance, and the Garonne, are studded with suspension-bridges—very graceful and airy to look at, but appearing to be exceedingly roughly finished, and anything but secure, on nearer examination. The swaying, and creaking, and cracking of many of those structures beneath the weight of a well-laden diligence is anything but comfortable to a nervous passenger. The model of the Menai Tubular Bridge, also a very beautiful specimen of neat-handedness, attracts much and deserved attention. One tube is represented as being in its place, and you can look through the hollow from end to end, just as in the actual tunnel; the other tube still rests upon the pontoons, in readiness to convey a notion how the gigantic square pipe was lifted to its place. The model of the schooner-yacht sailing beneath, however, is rather loftily rigged. It seems touch and go whether she would not have scraped her trucks upon the lower surface of the aerial railway.

Continuing to make our way eastwards along the Nave, we come to a whole city of model churches, one of them upon a very large scale. Some of these models have been designed for architectural purposes, and others are the productions of amateurs. A new material called Ladyshore terra cotta, of which substance in one of the sacred edifices in question, not only are walls and steeple built, but all the internal fittings, pews, pulpit, and even organ case. To the right in the Nave, at the departmental outlines of the cliff, and a noble promontory it is, are no doubt reproduced, but all the character of the rock is gone: the geologic peculiarities which give to all rocks their particular individualities have been left out of the question, and the whole affair has been smeared over with paint, and presents a glaring likeness formed from muddy water. Again, as a sample of the same taste, only rather more ambitious, we have the Shakspeare house idealised according to our confectionery standard, and surrounded with vile dolls purporting to represent the Shakspearian characters. The execution is worthy of the conception, which is utterly incongruous and unworkable, being indeed a most inharmonious union of an allegory and a fac simile; and the general standard of taste to which the work belongs is precisely that which would prevail in the mind of a child who should set to work to form cairns of shells, with holes in them, designated grottos in suburban teagardens. Now, we point out the faults in these productions in the very reverse of an unkind spirit to their constructors. They have at all events a certain degree of pretension, and a certain taste for imitative handiwork, which, when guided and turned into the true channels of art, may well produce something worthy of attention and admiration. But, until they study the nature they profess to imitate more closely, until, too, they attach to the house of Shakspeare that degree of veneration which can and what cannot be imitated in mimicry, this ingenuity of handiwork will only avail for the production of compositions as foreign from those presided over by pure and real art, as are the idols of India, with a hundred heads and a score of hands, from such conceptions as Apollo slaying Python, or Pallas triumphant over Athens.

Another model of Shakspeare's house, free from all allegorical rubbish, is by no means a bad specimen of the purely imitative power. A little more would be delighted with the conscientiousness with which every crack and nail hole in the old building is represented—the knarl and flaw in the woodwork, and every pebble in the rough-cast pavement. The ambition in this case has been humble; and, as a specimen of a miniature fac simile, the work is entitled to praise. After the same fashion is the model of the interior of the Sheffield cutler's very neat-handed specimen of miniature decorative upholstery. The effect would, however, have been much increased, had some mode been hit on of lighting up the interior, which is a great dull more gloomy than people generally seem to. A model of the interior of a house, illustrated and explained at a glance, the species of information, topographic and geologic, which these representations are fitted to convey. Besides seeing and understanding in a moment the general lie of the country, the student will at once perceive the causes of the formation of the formation of lakes in the valleys and glaciers in the higher hollows of the hills. He will also be able to see why the wood creeps up to a higher elevation in some spots than others—how it sometimes follows the nourishing power of a decaying crag or stone, how it sometimes owes its existence to the sheltered situations of tranquil hollows lying pleasantly towards the afternoon's sun. In all these maps, however, the points of the compass ought to be given. In the Swiss department there is another mountain model, forming the picture, not the map, principle—and the utterly unworkable phase of the picture principle, that of the ordinary landscape, not the bird's eye view: the effect is what might have been anticipated—the thing is a worse monstrosity even than the Shakspearean jubilee. A large landscape model, which naturally attracts a great deal more attention than the geographical model, is that of the castle, grounds, and general landscape of Roseneau, where Prince Albert was born. The foreground is occupied by crowds of figures—the occasion representing being that of rural games—a blythsome party of peasantry dancing round a May pole, and drinking numerous spectators looking on, with their meerschaums in their mouths, or delectating themselves in a neighbouring pavilion upon the national beverage of the Saxon, good humming "*bairsbeer*," or Bavarian beer. A very fine model of a forest scene, with a stream of water bickering wildly, crossed and veined by black beams, is introduced in the foreground. A waggon loaded with hay is coming along at comfortable Teutone small's pace. In the middle distance we have the Castle, a plain double-gabled building, placed upon an artificial mound, and surrounded with trees. The background, professing to give an extended view of the distant country, is necessarily a failure; and, indeed, the half-caricatured style of the figures in front prevents us from considering the whole affair in any other light than that of a specimen of unpretending ingenuity. There is considerable character in the figures, however; and the curious holiday head-gear of the female peasants—consisting mainly of a cataract of broad black ribbons flying over their shoulders—is imitated with great skill.

So much for some of the most prominent English and Foreign models in the Exhibition. We turn, for a concluding paragraph, to those sent us from other quarters of the globe; and, first, let us glance at the Indian and aboriginal cottages contained in the West Indian collection. There are two very curious and interesting models of these structures—one from Guiana, the other from Trinidad. Both are very rude and essentially savage, displaying, however, much of that neatness of fitness which savages often possess. The principle of construction is the same in both cases. Strong wooden uprights support a highly-rising roof, formed of strong palmetto leaves. About one-third of this dwelling, which has no regular walls, is partitioned off by a sort of square frame, forming the four sides of a room, but not rising higher than the uprights. Here there is a bed. In the outer portion of the house hammocks are hung, and rude hunting and fishing implements scattered about. The great height of the roof leaves an ample space between the rafters and the crest, which is crowded with lumber piled ingeniously in layers, so as to form a kind of garret or store-room for odds and ends. But the still more interesting model constructed by savages, or, at all events, semi-savages, is that of the native war pah, or New Zealand fort. It is a large stockaded place of defence, with a double line of palings and a ditch between; the construction of the palings, as manifest in the mode of binding the stakes together, being at once wonderfully strong and simple—so managed, indeed, as almost to preclude the possibility of a few stakes being forcibly pulled out without the whole wall going together. The most strange part of the model, however, is the disposition of the lines of defence in very much the same shape as those adopted in modern fortifications.

The same principle has evidently been acted on—the walls running so as to flank, command, and mutually fortify each other—and filling into the shapes to which we give the names of ravelines, bastions, flanking walls, and so forth. The adoption of a similar principle of defence by civilised and savage people, shews at once the common sense and common reason which prevails over the principles of fortification as we now teach them.

India is rich in models. We have many very interesting ones of Eastern ships, particularly the finely-shaped and moulded piratical craft which haunt the great Archipelago. Then there is a number of models of temple and shrines, some neatly manufactured, others rudely carved, but probably representing the originals with sufficient accuracy To this interesting collection of models figures were directed attention in a recent article on costume. The assemblage brings the actual condition of the natives before our eyes much more vividly than any picture could do Then there are interesting models, rudely made, but probably quite correct, of the processes of different trades. At the saw-pit there is, as with us, a top-sawyer and a subordinate. The weaver plies his rude-looking, but often skilfully-managed loom; the agriculturist, with a yoke of bullocks, treads out his plough to force it down the further into the earth; while, as in the time of the prophets, the hand-mill is still wrought by two women—a toilsome and a slavish work. On the opposite side of the great tent are arranged another set of models, representing what we may call high life in Asia. Here we are altogether among rajahs and nabobs: and we have miniature palankeens and howdahs, and thrones, miniature nautch dances, and miniature camel and elephant processions; not forgetting one specially interesting specimen of imitative art, proudly labelled "English officer drinking porter." Tearing ourselves away from this deliciously national memento, we find, at the back of the Peri Banon's tent—for that it must be, and no other—some of the most interesting and characteristic models in the Exhibition. Two of these are of courts of justice—the one presided over by a European in "muft," are of courts of justice—the one presided over by a European in "muft," the other by a native judge, gorgeous in gold and silk. The courts appear to be roofless; they are probably placed in the shade, and are mere platforms or hustings. The judge sits at the back: a couple of clerks and a couple of advocates, all natives, before him; three or four persons, acting, we presume, as ushers or officers of the court, and distinguished by yellow scarves, are in attendance outside the platform, which may be elevated some three feet from the ground, while the culprit is in both instances represented as begging with clasped hands apparently for mercy. Another interesting model is that representing Hindoo religious penances; half a dozen enthusiasts being suspended by hooks fixed in the dorsal muscles to a sort of revolving piece of carpentry, which is turned by their friends below, and the wretches swung in circular fashion, somewhat in the style of the revolving machines one sees at the fairs, although, in the present case, the poor fanatic victims can hardly be said to be in the enjoyment of a decided "merry-go-round." Among the miscellaneous Indian models is one of an indigo factory, with a curious sort of treadmill for getting up water; no end of pagodas and temples, with miserable humbugs of graven images, showing a descent in art almost to Chinese level; a clumsy, but elaborate representation of a fortified citadel, the men out of all proportion to the building; and perhaps the most curious of them all, the model of "The Encampment of a Collector of Revenue settling with the Cultivators." The space shown is a square piece of ground, intended probably to represent two or three acres. Here numerous tents are pitched; and peeping into them, you see the collector and his subordinates busy receiving and giving receipts for the cash. The tax-payers, who have paid up or are waiting their turns outside, are squatted in great numbers upon the grass—each man with his schedule in his hand, and, no doubt, grumbling lustily. The encampment is studded with trees, not much better than those arboriferous attempts we sometimes see made with shavings; but they bear vast crops of yellow and red fruits, and afford a resting-place, moreover, to no end of birds, as big as eagles, or swans at least. Behind the main encampment are piles of luggage. Camels lie in a line beneath the trees; bullocks and elephants fraternise amicably; and scores of servants fly from place to place. At a brook which meanders through the encampment, washing operations are being prosecuted with great vigour. Cavalry horses are picketed about, and a company of English infantry are lounging round their piled arms. Altogether, the model, though having no pretensions as a work of art, is very curious, very characteristic, and very instructive.

A LADY'S GLANCE AT THE GREAT EXHIBITION.

THERE is nothing more remarkable among the wonders of the great metropolis," than the ample manner in which the peculiar habits and bent of mind of every class of society is catered for in the way of public amusements. It has, however, been reserved for the Great Exhibition to comprise under its one crystal roof objects of interest to every one, and to solve the apparently impossible problem of satisfying every taste, and fulfilling expectations of the most opposite and contradictory character. The Londoner, wedded to the comforts and elegances of the metropolis; the country gentleman, profound in crops and agricultural implements; the mechanic and the labourer, intelligent on looms and on looms; the amateur in art, in search of a *chef d'œuvre*; the manufacturer on the *qui vive* for an idea; may each find there representatives of his own peculiar tastes, interests, and feelings, and to each will the whole, beheld from his own peculiar point of view, present itself in a different aspect.

Although by no means disposed to undervalue the interest which attaches to patent ploughs and improved steam-engines, or to depreciate for a moment the beauties of the Bavarian Lion, or the utility of Messrs. Taylor's Jacquard looms, still, as I am "only a woman," and cannot be expected to appreciate their details, I am content to leave their description to those whose experience renders them more competent to grapple with such mysteries; and, seeking in the retired byways of this Temple of Industry objects of a more congenial, if less important character, to view the Exhibition with a woman's eyes alone. I have the less hesitation in claiming a brief space for the examination of objects more peculiarly attractive to ladies, when I remember that there was perhaps scarcely ever a great work commenced in this country in which they have so fully participated. They began at the commencement with the Subscription Committee at Stafford House, as well as with the less aristocratic, but even more productive, meeting of ladies at the Mansion House; and at the final completion of the great work, their contributions to the adornment of the Building were found to have been neither few in number nor uninteresting in character. The objects in the Crystal Palace which address themselves especially to the predilections of ladies, are so numerous and so varied, that I am almost overwhelmed with the *embarras des richesses;* and not being of a mathematical turn of mind, I scarcely know where to begin; but the following may be instanced as among the most prominent:

To silks, as occupying so important a position in our own toilet, I must certainly give the precedence. They are offered for our inspection in every variety—damask, brocade, tabinet, glacé, striped, checked, watered, shaded, and clouded; some valuable from their brightness; some, the merit of which consists in their dulness alone. Many specimens are interesting not only from beauty of design and delicacy of manufacture, but from the histories which attach to them of the wearisome months of labour and anxiety employed in their manufacture, and of the obstacles which have been overcome by the skill and perseverance of the mechanists. As, however, I propose, on some future occasion, enlarging on these fabrics, I will proceed to what may be regarded as a humbler feature of the same department, and glance at the different specimens of ribbons. There are gauze, satin, sarsnet, velvet, and lutestring—plain, figured, flowered, stamped, and open in pattern as well as in texture; with edges plain, scalloped, pearled, and vandyked. These are present in every variety of width, quality, and colour. There is also a description peculiarly adapted for trimming; it is goffered and quilled in the process of manufacture, and with a regularity that the most skilful hand could never emulate. It is easy to prophesy for this invention a welcome from dressmakers as well as from their employers. To the former it will save many hours of ill-requited labour, whilst to the favour of the latter class its novelty will be a sure passport.

In alluding to the subject of Furs, I find myself really bewildered by the number of animals which have contributed their skins to enrich the various collections, among which the beautiful trophies of Mr. Nicholay, of Oxford-street, rank deservedly high. The aristocratic ermine, with many others of the weasel tribe, are to be found in perfection. The delicate chinchilla; the Siberian or Russian sable, the most valuable of its species; that from Hudson's Bay, only second to it in repute, are worthily represented. The wood-marten, a native of the German forests; the stone-marten, an inhabitant of rocks and ruined castles; and our own English marten, all add to the assemblage of materials for muffs, boas, trimmings, &c. In some instances, as in that of Mr. Nicholay, the skins are exhibited in a manufactured state, but this is by no means universally the case.

We shall find ourselves so amply rewarded for a minute investigation of the different varieties and individual specimens of Lace exhibited, that, not having adequate space at my disposal at the present time, I must content myself with observing, that our admiration is claimed by every description of Point, Honiton, Mechlin, Brussels, Valenciennes, &c., in the forms of dresses, veils, berthes, shawls, scarfs, cassavekas, &c., of a beauty and elegance hitherto never equalled.

Among other articles of luxury in the Crystal Palace, to which, as exclusively interesting to ladies, I must not omit to advert, are the fans of M. Duvelleroy, who employs, I am told, in his manufactory for their construction, no fewer than two thousand hands. Among the fans selected by him for exhibition, are a set intended for the ladies of the Sultan's Harem, decorated with designs from the "Arabian Nights;" there are also the fans which were used at the marriage of the Duchess of Orleans, painted by distinguished artists of the day: there too, precious relic of a most unfortunate woman, is the fan of Marie Antoinette, which has been recently repaired, and restored, I should imagine, to something like its former beauty; nothing had remained of the original except the panaches and pieces of the handle, which is of mother-of-pearl adorned with medallions and ornaments of carved gold. In the space formerly occupied by the Royal arms (erased during the Revolution) is now to be seen a picture from the pencil of Boucher. Some of those toys, enriched with jewels and works of art, have been sold at a sum approaching a thousand pounds each. Interesting and valuable, however, as such specimens may be from their adornment, they are in some respects inferior to the elegant feather-fans now in vogue, the lightness and airiness of which render them peculiarly applicable to the purpose for which they are designed.

Of feathers, the courtly decoration of ladies of all nations, and favourites alike with the most savage tribes and the most civilised orders, every variety seems collected here from the four quarters of the globe. The white plumage of the ostrich, the delicate feathers of the osprey, the egret, and the marabout, are rivals in beauty; some there are which, though little valued by us, are interesting as being employed by the chiefs of the wilderness as emblems of supremacy over their own wild brethren. Some, the tribute of birds long held sacred, as, for instance, the ibis, whose form was so favourite a subject with the artists of antiquity, and whose scarlet plumage in its natural condition forms so brilliant a wreath for the hair, also contribute their attractions. It is not, however, to ornamental purposes alone, that feathers are appropriated in the Exhibition. Bonnets composed of them have there made their appearance, and may be included amongst its decided novelties. The feathers selected for the purpose are those of the pheasant of many kinds, the goose, the swan, and especially the guinea-fowl; they are arranged on a shape in rows of diversified colours, and in many variations of pattern. The bonnets are light, soft, and warm; but, with regard to their beauty, there will be much difference of opinion, varying with the taste of different individuals.

Turn we now to the specimens of imitative art, which present themselves in the shape of Artificial Flowers, in the different forms and materials, which claim our wonder and admiration. It would, indeed, form a distinct Exhibition, of no little interest in itself, could the different specimens of imitative flowers, which are scattered through the Building, be collected in one spot, free from the admixture of any attractions foreign to themselves. Let us observe, first, the strange variety of substances, some of the most stubborn, and, apparently, unavailable character, which contribute material for the imitation of the lightest and most delicate of the creations of the Almighty, and unite as it were in doing homage to the world of flowers. Stone in endless variety, from granite to marble; wood of every hue and grain—the ebony, dyed black by nature; the delicate maple, box, and satin-wood, fairest of their order and even spices, the clove, nutmeg, and pimento, seem to blossom again in a new phase of existence. Precious stones, valuable for their rarity, add their costly contributions, and seem to gain new beauty in the guise of the rose, fuchsia, and forget-me-not. Even coal, the least valuable though not least beautiful specimen of the mineral kingdom, polished and fashioned into buds and blossoms, shows its dusky face among its betters, and has its claims to admiration most ungrudgingly allowed. The pure ivory tusks of the elephant, and the flexible bones of the whale, are alike made tributary to the genius of the garden; whilst the broad ocean sends her contributions of seaweed, coral, shells, and, lastly, pearls. Birds, too, resign their plumage—the peacock and the flamingo, the bird of paradise and the turtle dove, which gives its own name to the most beautiful of quiet colours. The insect tribe (the bitterest enemies of the flower race) have their representatives here to do them honour. The beetle of Brazil and the firefly contribute their wings, and the honey bee its wax; whilst man himself gives not only his labour and his ingenuity, but adds one of the most singular materials of all, his hair!

Amid so great a variety of specimens, each possessing some distinct claim to notice, either from beauty of design, elegance of arrangement, or the ingenuity which has produced excellence from apparently the most unpromising materials, it is somewhat difficult to determine where to award the palm of merit; and here my own personal tastes will of course have their preponderating influence. In the many visits I have myself paid to those portions of the walks and galleries of the Crystal Palace which are devoted to the exhibition of artificial flowers, the following struck me as peculiarly remarkable for artistic skill, beauty, and novelty.

In the ILLUSTRATED LONDON NEWS of the 7th of June, an Engraving was given of the *Magasin* of M. Constantin, situated in the Nave of the Building, conspicuous alike for its architectural attractions, its tasteful adornment, and the admiring crowd by which it is generally surrounded. It has been found necessary to guard it from too eager an approach by a railing, which, however, the proprietor has rendered as little conspicuous as possible by a covering of velvet, in deference to the admiration which causes the danger. Amongst the most beautiful, and certainly most original of the exquisite imitations in this collection, I must especially notice *for elsewhere I have seen none of their particular class to equal them* a variety of exotic plants as they appear in their various gradations of bud, blossom, full maturity, and, finally, drooping or dropped from their stems in decay The latter specimens are peculiarly effective; and the more so because the artist, with a taste commensurate with his skill, has represented them, in a withered state,

> Before decay's effacing fingers
> Have swept the lines where beauty lingers;

showing them attractive even in their decay. There will also be found in the same case a group of orchideous plants, a beautiful specimen of our English vine, the hop plant with its scaly fruit matching in vesture its beautiful leaves; then the lily of the valley, "veiled as a nun," to use the words of Wordsworth, near to her towering sister of the garden, as pure in colour, as elegant in form, and as pre-eminent for stately beauty as her fair namesake for humble grace.

The contributions of M. Tilman, the well-known manufacturer of Rue Menar, whose exquisite specimens of floral imitation, secured to him, it would appear, as effectually by skill as by the patents which he has obtained for them, will be found in the gallery of France (No 838). Here you may see wreaths for the hair, of every variety, and adapted to almost every phase of existence. First comes the simplest of orange blossom, sacred to the bride, destined, after being once worn, to be laid aside for the blush rose and jasmine of the East. To succeed these, when weary of them, she may assume here the seaweed garlands and coral chaplets of the Nereids, or array herself in wreaths of the beautifully minute water plants of the Naiads, which we see beneath the still pools and calm watercourses on a summer day; here they are, exquisite as in their native element, with tendrils of the wet grass glistening around them. Would she enact

> The fair Pastora by a fountain's side,

she may watch her own image in its waters, adorned with a coronal befitting her character. The quivering oats, the bearded rye, and corn of every description, are here collected; even the autumnal parasitic flowers, blue and red, beautiful in all eyes save those of the farmer, are not forgotten, but are here in readiness when the time of the summer rose and jasmine is over, to supply their place in the adornment of those refined connoisseurs in costume, who never deign to wear even an artificial flower out of season.

Nay, would she wander even farther from the beaten track, here may she adopt the vine and ivy garland of the Bacchante, the oak leaf and acorn fillet of the Druid, or be crowned with bay like Goethe or the Capitol. All are to be met with here, scarcely less beautiful than in nature itself; all, save the wreaths for the dead, and these art has no need to imitate, since nature herself supplies them in her own *immortelles*.

Beneath these specimens, in the same case, may be noticed as peculiarly beautiful, the passion-flower, white and lilac, with its fanciful associations of holiness; the lotus, pure and placid as sculpture among flowers, with even the dust upon its leaves; roses in all their infinite variety; tropical plants of sunny hue, equally difficult to name as to describe. More exquisite still, perhaps as specimens of imitative art the most wonderful of all, are tufts of every variety of grasses, in their different stages of progress towards ripeness, which, humble as they are, detain the eye long after it has been satiated by the charms of their more showy and pretentious rivals. From the reedy sedge to the quaking grass, all find here their perfect representatives. A rough, but intelligent, country lad, who stood beside me for some minutes, after a gaze of silent wonder, broke out with the best compliment I had heard to the fidelity of these imitations, by remarking, in his own vernacular, that they only wanted a "*bird's nest*" to be nature itself.

A short instance from the cases of M. Tilman is an exhibition which, for originality of design and effect, is almost unique. It might, at first sight, appear rather to form a feature in the specimens of *lace*, to which I propose adverting hereafter, than in the collection to which our attention is now more particularly directed; but, as its novelty consists less in the manufacture of the fabric than in the purpose to which it is applied, it seems but right that honour should be rendered to it here. In case 266, Madame Josephine Hubert, of No. 2, Rue du Grand Chantier, Paris, exhibits an entirely new application of lace in the formation of artificial flowers. The mere representation of flowers in lace, woven by hand in the material, as exemplified in the fabrics of England and Valenciennes, or inserted in it, as in the Honiton and *appliquée* laces, is of course familiar to every lady. We have thus seen them produced in bud and blossom, *en profile*, and, as it were, full-faced; but in one single important feature they were identical—they all bloomed on a flat surface. It seems to have been reserved for Madame Hubert to exhibit them in the same exquisite material, independent as the original flowers they are designed to imitate; erect or drooping, as we see them in nature; in forms globular, bell-shaped, or expanded, capable, but for their delicacy, of even holding water. The petals of each flower are spread out separately, or folded over each other; they are convex or concave, as the chosen specimen demands, and, wonderful as it may appear, are complete even to the pistils and stamens. Here may be seen the rose, major convolvulus, and other larger flowers, grouped together in forms suitable for the decoration of the skirts of dresses, with little *bouquets* of harebell, snowdrop, &c., arranged for the bosom. Their effect on a velvet dress must be delicate and striking in the extreme; but to show them to the greatest advantage, a dark background would always be desirable. I may account to notice one great advantage which the flowers of Madame Hubert possess over their rivals of cambric, wax, &c.—nay, even over the originals from which they are copied!—and it is this, that they are all warranted to wash. This is an age of wonders, and I confess myself gifted with a large belief, otherwise it would be difficult to conceive it possible that any fingers less experienced and expert than those of the inventress could restore forms so fragile to anything resembling their original perfection.

In the number of this Journal for the 31st May, a plate was given of the celebrated *Victoria regia*, as it bloomed in the nursery-ground of Messrs. Weeks, of the King's-road, who had been successful enough to induce this coy beauty to blossom in the open air. Perhaps there are few of the more wealthy classes in London who have not paid a visit to this rare plant, either there or elsewhere. If, however, any one has missed this sight, she may still have an opportunity of seeing it reproduced in wax, in the collection of Mrs. Strickland, of Bond-street, in the North-west Gallery. I chanced to have seen the flower itself in bloom at the Botanic Gardens only the day before I first visited the stall of Mrs. Strickland in the Exhibition, and an imitation more faithful it would be difficult to imagine. There it is flower, bud, and leaf—with the blue and white water-lilies surrounding it, like maids of honour in waiting upon a queen. In case any of my readers should be unacquainted with the flower, I may observe that it is of a creamy white colour, with the inner petals pink: the outer leaves, inclosing it as in a cup, are thickly spiked or thorned, as though to protect it from harm. All these features are most accurately given, as may be imagined when it is known that each leaf took a period of two hours merely to furnish with its prickly guardians. Nor is this all: visitors to the original plant are usually treated to a sight of the giant leaf on its reverse side (that ordinarily hidden by the water), which is most curious in its construction, looking, with its brown ribbed surface, more like wrought iron rusted by time than any substance of a vegetable nature: this view of it has also been repeated in wax, with equal success by Mrs. Strickland, who is, I believe, the only person by whom it has been achieved. Another beautiful production of her art is *Leuchæstis nobilis*, first flowered by Mrs. Lawrence, if we mistake not, which won for her a prize from the Botanic Society. This is surrounded by the calmia, the tigreda (a butterfly among flowers), the slipper flower, with its long tendrils, the magnolia in bud, by many which it would require a florist to designate. I must not omit to recommend to the minute attention of those interested in detail as well as in effect, the clustered bunches of heaths: the flowers of one particular specimen, though scarcely as large as a barley-corn, are each supported by their individual stem. It will be evident to every one that Mrs. Strickland is an enthusiast in her art, possessing a perfect mastery over her materials, and as much of a genius as an artist, in the path she has adopted; and, when we are informed that lessons in this elegant accomplishment may be obtained for five shillings each; that the necessary materials are clean enough to be touched by fingers the most delicate, and may be arranged on a space little larger than could be covered by a cambric handkerchief; I must be allowed to recommend its acquirement and practice to my young friends, in preference to the knitting and crochet, which seem rather adapted for the recreation of those whose eyesight has grown dim, and whose hand has in some degree "lost its cunning." Before quitting the subject, I may advert to another species of artificial flowers, composed of fine silk stretched across a fine framework of twisted wire. They are rather curious than very pretty; and, as representatives of nature, are inferior to the well known feather flowers, or even those formed of dyed whalebone.

A beautiful bouquet, composed exclusively of human hair, is exhibited in a frame in the South-eastern Nave; and, although not presenting that variety to be found in other imitations of flowers to which we have before alluded, it is curious from its fidelity in form, and the ingenuity with which the most is made of the limited advantages of colour afforded by the material.

My next paper I propose to devote to a more detailed examination of some other features interesting to ladies, and to which I have here only cursorily alluded.

IONIAN ISLANDS AND CEYLON COURT.

THE IONIAN ISLANDS AND CEYLON.

OUR Engraving shows almost the whole portion of space occupied by the contributions from the Ionian Islands and Ceylon, from both of which a much larger display might have been looked for.

The Ionian Islands have but few manufactures; their available land amounts to about 500,000 acres, and the population is not much above 250,000. They enjoy a beautiful climate, but are subject to hurricanes and earthquakes, and, occasionally, the oppressive heat of the suffocating sirocco. The vine thrives, and more than three-fourths of the cultivable land is devoted to vineyards, currant grounds, and olive plantations. The annual produce of currants is between 17,000,000 and 18,000,000 pounds, and of olive oil from 100,000 to 120,000 barrels; and of wine, about 200,000. The peasants' wives spin and weave coarse woollen cloth. Silk, especially scarfs and handkerchiefs, is manufactured at Zante.

In 1817, these islands, seven in number, and forming nominally a republic, but in reality a most exclusive and corrupt oligarchy, came under the protection of Great Britain; and it is said by those well acquainted with the islands, that, under due encouragement from the present High Commissioner, Sir Henry Ward, they might have occupied, with a really beautiful show of materials, manufactures, peasant work, trinkets, and models, a much larger and very attractive space in the Exhibition.

In the case shown at top of our Engraving is a gold embroidered Greek jacket, and two tastefully bordered knitted aprons, the work of a peasant girl at Corfu; below it, in a case, are silk scarfs and handkerchiefs, from Zante; purses, cigar-cases, tobacco-boxes, and bags in gold embroidery on velvet, the work also of peasant girls (and very tastefully worked they are), at Santa Maura; and gold and silver bracelets, brooches of hammered and filigree, from Corfu.

To the right of this little collection of Ionian goods are the articles sent from Ceylon. The round tables shown in the Engraving are composed of from thirty to five and thirty varieties of wood fitted for cabinet-making, and amongst which are varieties of teak, satin-wood, cocoa-nut, mahogany, and a number of light and dark plain, feathered, and shaded woods. The pillars foot, and frame of the tables are of carved ebony, the divisions of the veneers in inlaid silver, and two of them are also inlaid in white and stained ivory. Thirty-seven varieties of timber are shown in blocks of about 18 inches long and 4 inches square, having one side polished. There is also an open case, showing the several sorts of cinnamon, and in which the perfect evenness and fineness of the best must satisfy most housekeepers, that, whatever the price, they seldom meet the best of this delicious spice. There are also models of coffee stores and drying platforms; the machinery for removing the inner skin of the berry; model of a building for carrying on Cherhew's patent process of coffee-curing, in which the floors, instead of sacking, as in the ordinary drying-house, are of perforated metal artificially heated from below. In front are cases of gums and seeds, showing the castor nut, from which the oil is made; varieties of rice and coffee in different states. Then there are native-made nets, cloth, matting, medicinal oils prepared from various seeds; painted earthenware, amongst the specimens of which is a tea-pot of the King of Kandy, which would hold a couple of gallons. But viewing Ceylon as a land of elephants, spices, pearls, precious stones, and curious costumes, ruins, temples, customs, and races, the display is certainly but meagre, and one to which, we are inclined to think, Lord Torrington, Colonel Thompson, of the Royal Engineers, Mr. Tuffnell, and others, could make many interesting and valuable additions.

BAY OF THE FINE ART COURT.

OUR Engraving shows the centre stand, next the Nave, of this court, which, as our readers are aware, is devoted almost entirely to architectural models, decorations, and designs. The public are most attracted by the illuminated glass mosaics exhibited by Mr. George Henry Stevens, of Stafford-row, Pimlico; the effect shown in a pair of twisted columns, tables entirely of the mosaic and with the mosaic inlaid in tracery on marble, and a specimen of heraldic emblazonry, is exceedingly rich, and shows that this style of ornament, probably the very first form, after precious stones, that mosaic ever took, is capable of being applied to vast varieties of monumental, heraldic, and house decorations. Mr. Stevens has spent some years in bringing his mosaics to their present perfection, and has, certainly, in the specimens exhibited, shown both artistic arrangement of colour and skill of workmanship. On the same stand are shown some very beautifully modelled *terra cotta* figures and vases, by Beauclerk, in clays of different shades of color. Slabs for tables in inlaid marble, designed by Gruner, executed by Woodruff, and exhibited by his Royal Highness Prince Albert. A china biscuit tazza, designed by J. O. Small, and modelled by Messrs. Small and Malling, Newcastle-upon-Tyne. A candelabrum, designed by Gruner, executed by Romoli, and also exhibited by the Prince. A new design for a candelabrum, by William Mossman, 17, Regent-street, Pentonville, in brass, made in 741 pieces, fastened by screws, and so contrived that the whole can be set up in a variety of shapes.

The remainder of the stand is almost entirely occupied by architectural models. First in size stands a very elaborately executed model of the Cathedral, in oak, by F. and J. B. Webb, cabinet-makers, of Taunton. The Royal Exchange and the Monument, modelled in cork, by Thomas Smyth, jun., at the cork manufactory, 19, Eastcheap; specimens, certainly, of care and skill. A composite column, after the Ionic, designed by Mr. Smalman Smith, architect, to represent the Exhibition; the capital is composed of initial letters and the Prince of Wales' plume; the column represents a bundle of reeds, to show the union of all classes of society; the three kingdoms are displayed in the base, by the rose, shamrock, and thistle; and the spirit of union, to the disfigurement, as it seems to us, of the column, by three bands or garters round it. Else the column,

BAY OF THE FINE ART COURT.

though it falls short of the Exhibition, in showing but the three kingdoms where it should have shown the world, is nicely devised, and well proportioned.

Close to this are some beautifully finished models in ivory, produced entirely in a lathe, and solely by circular motion; amongst others, of the Temples of Neptune, Jupiter Tonans and Stator, at Rome; and the columns of Phocas and Pompey's Pillar. Models of Clumber House, the seat of the Duke of Newcastle, cut with a pen-knife in cardboard, on a scale of ¼ in. to a foot, and containing vast multitudes of pieces, by James Pambridge, footman to his Grace. Model of Government Record-Office, by J. D. Didstone. Design for general Hospital, by H.S. Merrett. County Court-House, for Newcastle-upon-Tyne, by Grainger. Model, by William Bardwell, of a design for a public building, and which he modestly calls the parent of St. George's Hall, Liverpool—the truly grand and original design of the lamented Elms, an architect and artist of true originality and genius, and the parent of whose building was his own ideal, his inate perception of grandeur of proportion and beauty of design laboriously and carefully trained and cultivated. For the rest, there are card-board models of York Minster, by Middleton, architect, Darlington; one of St. Paul's, by H. S. Scollish, Birmingham, in card-board, cut with a knife, and composed of 50,000 pieces—a labour, it seems to us, in vain, as a model of equal utility could have been made at far less cost of time.

In a corner of this table is placed a miniature model, in wax, by Montanasi, late a citizen of Mexico, of a man dying in the last stage of consumption. Why placed there, we know not; but, though wondrously true to the worn and grasping death-flushed skeleton of one wasted by that slow devouring disease, it is misplaced, and should, we think, be removed to some place where people might take their choice as to seeing it.

The last object we have to mention is the restoration of the ancient harp in the Trinity College Museum, Dublin, and which goes by the name there of the harp of Brian Borohme. Be it an instrument that the King's fingers touched, or bard ever sang to before him in hour of feasting or victory or not, it at all events has some look of music in its form, and is worth a study by Erard and others, who have laid on elaborate gilding and ornament instead of such harmonious graceful curves as those of this old kingly instrument.

THE HALIFAX COURT.

HALIFAX is precisely one of those seats of industry, that, in proportion to its importance, can make but an indifferent display at the Exhibition. It dyes yarns for all Yorkshire, and makes a vast quantity of articles, of which we have already spoken at length in our description of mixed fabrics, both for the home and foreign markets.

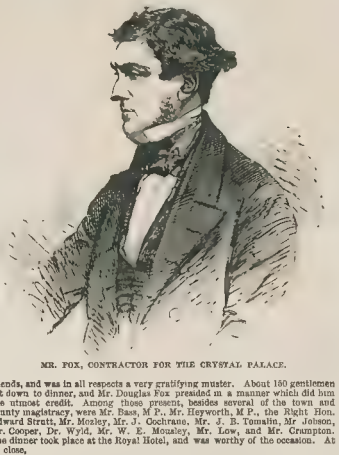
The show of goods from Halifax is not large, but it fairly enough represents the industry of the town, and there was no purpose to be gained by any more extensive display. The exhibitors are James Akroyd and Son, who, in a neatly-arranged frame, show the several descriptions of yarns used in the various articles of manufacture: carded and combed twofold yarns, two and threefold genappes, imitation genappes, genappe warp and weft, combed, fourfold combed, and carded; embroidery yarn, and single and double yarns, carded: and in finished fabrics they have damasks in the several mixtures of silk, cotton, and wool, some of them exceedingly rich in colour and design; Orleans cloth, merinoes, Coburgs, camlets, serges, shalloons, lastings, &c.; various mixtures of alpaca, first introduced in the neighbouring town of Bradford, by Titus Salt, in 1835, when he bought a parcel which had lain long on the importer's hands, and was beginning to be thought useless, though it is now so largely used that the price has risen from 8d. and 9d. per lb. to 2s. 3d., and even at times to 2s. 6d. and 2s. 8d. This firm are the largest producers in the town; and some idea may be formed of the extent of their operations from the fact that they pay wages to the amount of £160,000 per annum. William Brown and Messrs. Hoadley and Pridie exhibit table-covers, bombazins, damasks, and Coburg cloth; and Holdsworth and Co., amongst other articles, richly printed woollen-hangings, brighter, softer, and with the same style of pattern as the ordinary chintzes. Baracloath and Sons, wadding, seven stamped table-covers, printers' blankets, &c. The other exhibitors are J. Clay and Sons, and M. Ward, of Sowerby-bridge; H. C. M'Crea and Co., Limbrook Mills; J. Alred and Sons, and Sheppard and Perfect, Halifax.

Clothworking first found a place at Halifax in the commencement of the fifteenth century, and, aided by water communication with both Hull and Liverpool, it has risen rapidly since the introduction of the power-loom and the use of mixed fabrics.

The town, which is almost entirely built of stone, is prettily situated on a gradually rising ground, in the midst of a group of hills, and the scenery of the neighbourhood is varied and beautiful. The population of Halifax, in 1801, was 63,494; and in 1841, 130,743.

DINNER TO MR. FOX, AT DERBY.

ON Saturday, the inhabitants of the town of Derby entertained Mr. Fox, their fellow-townsman, head of the firm of Fox and Henderson, at a public dinner, in honour of his great achievement, the Crystal Palace. The occasion must have been a peculiarly gratifying one to that gentleman, to his brother, who is this year, for the third time, mayor of the borough, and to all his friends, who flocked around him to testify their admiration of his successful labours and their respect for his private character. Mr. Paxton had been specially invited to be present, and came accordingly. Mr. Henderson was prevented from attending by his delicate state of health. As to the rest of the company, it comprised many of the chief guest's most respected townsmen and



MR. FOX, CONTRACTOR FOR THE CRYSTAL PALACE.

friends, and was in all respects a very gratifying muster. About 150 gentlemen sat down to dinner, and Mr. Douglas Fox presided in a manner which did him the utmost credit. Among those present, besides several of the town and county magistracy, were Mr. Bass, M.P., Mr. Heyworth, M.P., the Right Hon. Edward Strutt, Mr. Mosley, Mr. J. Cochrane, Mr. J. B. Tomalin, Mr Jobson, Mr. Cooper, Dr. Wyld, Mr. W. E. Mousley, Mr. Low, and Mr. Crumpton. The dinner took place at the Royal Hotel, and was worthy of the occasion. At its close,

The Chairman gave the usual loyal and constitutional toasts, which were received with great applause.

Mr. Mousley then proposed, in highly laudatory terms, the health of the guest of the evening, Mr. Fox, which it is almost unnecessary to say was received with the utmost enthusiasm.

Mr. Fox rose and said—Mr. Mayor, my dear friends, and fellow-townsmen: In rising to return thanks for the very handsome manner in which you have been pleased to drink my health, I assure you I feel far more difficulty and embarrassment than I ever experienced at any period during the construction of the Crystal Palace. It is impossible to express my feelings upon this the most delightful occasion of my life, when so much more has been said than is deserved, and so kindly said, in praise of the manner in which the work has been carried out by my good partner, Mr. Henderson, and myself. Whatever may have been the weight of care and responsibility under which I have lived for the last twelve months, I am amply repaid for it all in the perfect success which has hitherto attended the progress of the Exhibition, in the approbation expressed by our gracious Sovereign, in the kind congratulation of all my friends, and now in the enthusiastic and heartfelt manner in which the toast has been responded to by this distinguished assembly of my fellow-townsmen. This handsome acknowledgment of my labours is doubly gratifying to me from the pleasure it will afford among other members of my family—to one who, from a residence of 60 years in Derby, is beloved by many of you, and for whom I cherish the strongest filial affection; and to my brother, Mr. Douglas Fox, whom, in proof of the respect entertained for him, you have called upon for the third time to fill the office of chief magistrate in your town. But would that one were here who from my earliest childhood was my benefactor and friend—to whom, on again visiting my native town, my mind naturally reverts—one whose life was spent in a continual desire to benefit the town of Derby—who was always the patron of art and manufactures, and the best friend of the people, and who, of all others, would have gloried in the success of the Great Exhibition. I need not say that I allude to the late Mr. Joseph Strutt.

Before entering on a brief history of the Building, I wish to state, that it is to Mr Paxton's idea of a palace of iron and glass, which it has been my lot to mature and realise, that the public are indebted for the present structure in Hyde Park; and that gentleman proudly acknowledges, that, but for the enlightened views of the Duke of Devonshire, the Lord-Lieutenant of this county, and his Grace's princely expenditure at Chatsworth, the idea of such a building might never have been entertained.

In June, 1850, the Royal Commission invited contractors to tender for a building to be erected in Hyde Park, in conformity with plans and specifications prepared by the Building Committee.

The Building, which was intended to consist principally of brick and iron, with a splendid dome in the centre, was considered of too permanent a nature for subsequent removal, and public opinion to this effect was very generally expressed.

In the printed conditions of tender issued by the Building Committee, the following clause was introduced:—

"Tenders for methods of construction other than those shown upon the drawings, and described in the specifications will be entertained, but on condition only of their being accompanied by working drawings and specifications, and fully priced bills of quantities.

This invitation to parties to send in tenders, based not only on the committee's plans, but upon such other designs as they might wish to submit, induced me to believe that a tender for a building of glass and iron, as suggested to me, for the first time, by Mr. Paxton, on the 22nd June, 1850, just twelve months ago, an engraving of which was published in the ILLUSTRATED LONDON NEWS on the 6th July, would meet not only with the approbation of the Building Committee, but with that of the public at large; and I therefore went to Birmingham on the 28th June, and put in hand the drawings and specifications upon which our tender to the committee was to be based.

On the 2nd July, Mr. Cole, having heard of our intention to make an offer for a building of the kind, and feeling strongly that the success of the Exhibition depended upon having an attractive and suitable building, came down to Birmingham, at his own suggestion, but with the permission of competent authority, to stimulate us to proceed, and to offer such hints in reference to the requirements of the case as would enable us to make the conception of Mr. Paxton conform strictly to the condition of tender required by the Commissioners, and therefore most likely to meet with the approbation of the Building Committee; and I am of opinion, that to his spirited advice we are mainly indebted for obtaining an impregnable *locus stands* on the merits of our case.

In all this I had the co-operation of my partner, Mr. Henderson, who, feeling with me the value of Mr. Cole's suggestions, and the great importance in the preparation of these drawings, of conforming as much as possible to the arrangements adopted by the Committee in the plan upon which they had invited tenders, proposed the addition of the transept, in the propriety of which Mr. Paxton, after due consideration, entirely concurred.

Before completing our tender, and with a view to a more precise appreciation of the magnitude of a building covering 18 acres—1850 feet long, 408 feet wide, and 64 feet high, irrespective of the arched roof of the transept—I walked out one evening into Portland-place; and there setting off the 1850 feet upon the pavement, found it the same length within a few yards; and then, considering that the building would be three times the width of that fine street, and the Nave as high as the houses on either side, I had presented to my mind a pretty good idea of what we are about to undertake, and I confess that I considered the difficulties to be surmounted in constructing that great Palace were of no ordinary kind; but feeling confident, that, with great energy, good arrangements, and a hearty co-operation on the part of our extensive and well-disciplined staff, it might be accomplished, and that upon it depended in all probability the success of the Exhibition, we determined to undertake the responsibility; and the opening on the 1st May has proved the correctness of our conclusions

The plans and specifications prepared by us in great haste were submitted to the Commissioners, together with a tender, on the 10th July; but, though sufficient to enable us to bring the subject before them, and to convey to their minds an idea of what we proposed to erect, they were necessarily very incomplete, and did not contain either sufficient architectural or mechanical detail to admit of their being used in the execution of the works. The arched roof was afterwards added to the design, and submitted to the Commissioners on the 18th July, with the view of getting over a difficulty which existed in consequence of the elm trees being too tall to be covered by the flat roof proposed by Mr. Paxton.

These trees were, as Professor Cowper stated in his admirable lecture on the last day of the past year, "John Bull's Trees of Liberty," upon which, for some reason, he had set his heart in preference to all others, and would not consent to their removal. For the expense attending the addition of the arched roof to the transept, Fox, Henderson, and Co. did not increase the amount of their former tender, and it was consequently executed at their sole expense.

The Building Committee, having had the matter under their consideration from the 15th to the 25th July, resolved unanimously to recommend the Commissioners to accept our offer for the building with the arched roof, and nothing could be more disinterested than their conduct in setting aside the drawings and specifications which, with much labour, they had prepared, and adopting others, which, though laid before them in so imperfect a state, presented to their minds, as experienced engineers and architects, the mode of constructing a building of iron and glass better fitted for the purposes of the Exhibition.

On the recommendation of the Building Committee, the Commissioners on the 26th July were pleased to signify their wish for us to construct the building, but were met by a difficulty which threatened to postpone for a year, if not to put an end to the Exhibition altogether.

The Solicitor to the Treasury gave as his opinion, that, until the Commissioners had obtained a Royal charter, they could not legally proceed, and were therefore not in a position to give an order to any one. These circumstances were explained to us by Lord Granville on the 30th of July, in the presence of the Commissioners, who at the same time told us that it was their fixed

HALIFAX COURT.

intention to apply to Government for the charter, and he had every reason to believe it would be granted; and having informed us that as soon as they were a legally constituted body they would probably conclude a contract with Fox Henderson, and Co., finished by asking whether under these circumstances we should consider it running too great a risk to enter at once upon the execution of the work, as otherwise many weeks would unavoidably be lost, and the chance of opening the Exhibition on the 1st of May placed beyond possibility. In reply to his Lordship's inquiry, seeing the imperative necessity for immediate action, and desiring to render all the assistance in our power in furtherance of the important objects of the Exhibition, we expressed our willingness to run the risk, whatever it might be, and without waiting for the charter commenced at once the drawings and the necessary operations for the erection of the building.

As the time for the execution of the Building was so extremely limited, and being well aware, from experience, that when matters of business had to be decided by a committee composed of many persons, much valuable time was generally wasted, we requested the Commissioners, instead of referring us to the Building Committee, to select one of its members, either the chairman, Mr. Cubitt, President of the Institution of Civil Engineers, Mr. Robert Stephenson, or Mr Brunel, and give him absolute power to settle with us finally all matters connected with the arduous task we were then willing to enter upon. The Commissioners, appreciating the importance of this request, appointed Mr. Cubitt to fill this office.

It was now that I commenced the laborious work of deciding upon the proportions and strengths required in every part of this great and novel structure, so as to ensure that perfect safety essential in a building destined to receive millions of human beings—one so entirely without precedent, and where mistakes might have led to the most serious disasters. Having satisfied myself on these necessary points, I set to work and made every important drawing of the Building as it now stands with my own hand; and I was no small source of gratification to me, when asking Mr. Cubitt to look over the drawings I had prepared, to find that he not only had no desire to suggest alterations, but expressed his entire approbation of them all.

The Commissioners having carefully considered the merits of the various sites proposed for the Exhibition, amongst which may be named Leicester-square, Somerset House, Trafalgar-square, the Isle of Dogs, Battersea-fields, and Regent's Park, selected, after the most careful consideration, a portion of Hyde Park situated between the Serpentine River and the Queen's Drive, and gave us possession of the ground on the 30th of July, when we proceeded to take the necessary levels and surveys, and to set out with great precision the position of the various parts of the Building.

The drawings occupied me about eighteen hours each day for seven weeks, and as they came from my hand Mr. Henderson immediately prepared the ironwork and other materials required in the construction of the Building.

As the drawings proceeded the calculations of strength were made, and as soon as a number of the important parts were prepared, such as the cast-iron girders and wrought-iron tresses, we invited Mr. Cubitt to pay a visit to our works at Birmingham, to witness a set of experiments in proof of the correctness of these calculations. We first placed upon each part the greatest load it could ever in practice receive, and proceeded to show that above four times that load was required before fracture would occur. These proofs were made on the 6th September, when Mr. Cubitt was pleased to state that he never witnessed a set of experiments of a more conclusive nature. Being thus satisfied by actual experiment that the proportions of the various parts of the Building were such as to ensure perfect stability and safety, the preparation of the ironwork and other materials was pushed forward with the greatest vigour, and large deliveries were made in the Park within the next three weeks; so that on the 26th September we were enabled to fix the first column in its place. From this time I took the general management of the Building under my charge, and spent all my time upon the works, feeling, that, unless the same person who had made the drawings was always present to assign to each part as it arrived upon the ground its proper position in the structure, it would be impossible to finish the Building in time to ensure the opening on the 1st of May; and I am confident that if any other course had been taken, or if, as is usual in the construction of large buildings, the drawings had been prepared by an architect, and the words executed by a contractor instead of, as in the present case, these separate functions being combined by my making the drawings and then superintending the execution of the work, a building of such dimensions could not have been completed within a period considered by experienced persons altogether inadequate for the purpose.

The erection of the Building, now fairly commenced, was pushed forward with all possible speed, and a good notion of the amount of work may be obtained from the fact that at one period we fixed as much ironwork every day as would be required in a roof of equal extent to the passenger station of this town, which is one of the largest in the kingdom.

It was not until the 31st of October that the contract with the Commissioners was completed; up to which time we not only had received no order for the Building and no payment on account of the work we had done, but were under the risk of expending upwards of £30,000 without being in a legal position to call upon the Commissioners for any portion of the sum we had so expended; and such was the appreciation of our conduct in this matter, that Lord Granville was pleased, in the presence of the other members of the Commission, to state, on the 6th of November, that they were of opinion, that, but for the courage evinced by Fox, Henderson, and Co., in commencing the work without any order from the Commissioners, the Exhibition of Industry of all Nations would never have taken place.

Perhaps the most difficult and hazardous, and certainly the most interesting portion of the work, was raising the sixteen ribs of the Transept to their places. A month was the shortest time assigned by any one for this operation. We commenced on the 4th of December, and succeeded in raising two in the course of that day.

Two more were safely deposited in their places in the presence of his Royal Highness Prince Albert on the following day, and the last pair on December the 12th; so that the sixteen ribs were all placed in eight working days.

As the Building progressed, I was assailed on all sides, not only by unprofessional persons, but by men of high scientific attainments, who, notwithstanding the careful calculations which had been made, and the satisfactory proofs to which all the important parts were individually subjected, as soon as these parts were put together, producing a structure of unparalleled lightness, doubted the possibility of possessing, as a whole, that strength which was necessary to make it safe against the many trying influences to which it must necessarily be subjected.

One gentleman, after complimenting me upon the beautiful appearance of the Building, stated his belief that it would never come down unless it tumbled down, and which he had no doubt, in his own mind, it would; or that the first gust of wind would blow it down like a pack of cards. Another, during a high scientific appointment under Government, after a long investigation of the various parts of the Building, expressed, at the Institution of Civil Engineers, a belief in the entire want of safety in its construction; and after explaining the mode of connecting the girders with the columns by means of projections technically called snugs, went on to indulge in an airy prophecy that a wind exerting a force equal to 10 lb. per superficial foot would, by acting upon these snugs as to break them all off, cause them to fall down in shivers. I may just remark, that, since the expression of this opinion, the wind ranges around London have registered, in the late storms, a pressure of 30 lb. per foot; and I have pleasure in informing you that the encouraging predictions of this gentleman, as well as those of many others, have not yet been fulfilled.

It may be amusing and not uninteresting to enumerate, briefly, some of the difficulties and dangers which were foretold.

1st. We should never get through our work in time.

2nd. The foundations were defective, and would surely give way.

3rd. The Building was more like scaffolding than anything else, and was so light that it must tumble down.

4th. The weight of goods and people in the galleries would be sure to bring down the Building; and, if the mere weight did not produce the effect, the vibration caused by people walking, or more especially running, would be sure to do so.

5th. The girders expanding by the heat of the sun would push the columns out of their places, and in doing so would be sure to break them and let down the Building.

6th. That if it should happen that the weight and vibration did not produce the effects expected, the equinoctial gales would, at all events, finish the business.

7th. That if the Building was not blown down, the sashes or windows were so feeble that they would assuredly be blown in, or out, but it was difficult to say which.

8th. That the glass was so weak that it could not resist a gale of wind, but would inevitably be blown to pieces.

9th. That if the wind did not act as was expected, firing cannon in Hyde Park, on the opposite side of the Serpentine, would not fail to demolish the windows.

10th. That the first hailstorm would leave the whole roof without glass.

11th. That by the vibration of the moving machinery the Building would be gradually shaken loose in all the corners, and must consequently fall down.

12th. That such were the fears entertained for the safety of the galleries containing the large organ and choirs, that a request was made to Dr. Henry Wylde by some members of the Jury for Musical Instruments, that he would, previous to the inauguration, urge upon my mind the necessity for an investigation into the results likely to ensue from the effect of the vibration which would be brought into action during the performance of the National Anthem.

13th. That the vibration caused by the diapason pipes of the large organ would shake out the glass, which would fall in showers upon the spectators; and our chairman very accordingly instructed by the Commissioners to make experiments with the view of ascertaining what the effect really is, and those experiments were officially made on the day previous to the opening.

Many of these misgivings appeared in the newspapers, and we forgot that we were in the eye of a fourth Estate—the Times—already famous for pointing out the nature of the danger we were running.

In fact, statements of this kind were so frequent and pointed, that we were often seriously advised to reply to them; the feeling confident we were right, and that we should succeed in all we had undertaken, and that consequently the more people spoke against us the more complete would be the reaction in our favour, we abstained from taking any notice of what was said—leaving the public to amuse themselves in the matter in any way they thought proper.

It is far from my intention, in speaking lightly of the past predictions, to taunt the public with the mistakes of a few over-anxious friends; but, after so excellent a dinner, one feels too good-humoured to discuss such little troubles seriously, or to say more of them than to express a legitimate satisfaction in the proof given by the event, that it is often easier to talk of great matters than understand them.

Before concluding, permit me to present my thanks to Mr. Barry, for his invaluable improvement in the architectural beauty of the Building; to Mr. Owen Jones, for his many beautiful designs for the embellishment of the Building, and to whose taste in decorative art is owing that splendid appearance which has charmed the eye of every spectator; to Messrs. Cochrane and Co., and Mr. Johnson, for the energetic manner in which they prepared the castings; to Messrs. Dowson and Co., for their promptitude in delivering the timber; and to Mr. John Cochrane, and all persons in our employ connected with the work, for their willing services, so indispensable in carrying out a contract of such unexampled magnitude. When the Royal Commissioners confided to us the construction of the Building for the Exhibition of Industry of all Nations, I felt in some degree the credit of England was in our hands—that we had it in our power to achieve that which would prove eminently successful—or in failing to do so would be a source of the most serious disappointment and disgrace—and that we were therefore bound, by considerations of no ordinary kind, to exert every effort in our power to carry the work to completion in the shortest possible time, and at any personal sacrifice, and without regarding the question of expense, the more especially as his Royal Highness Prince Albert had invited the World to this great festival of the 1st of May; and it was essential, as a point of national honour, that this vast edifice should be ready for the reception of his guests. I need not remind you that we completed the contracts, and that our beloved Sovereign presided at the inauguration on the day which had been originally appointed.

I feel a peculiar pleasure in having carried out this great undertaking in the consideration that it is not a republic in which the representatives of nations will meet together for the purpose of adjusting matters of strife, or questions of warfare, but one in which the Prince has invited all the family of man to assemble in harmony and good-fellowship, and where juries composed of distinguished foreigners and Englishmen meet together as friends to decide upon the comparative merits of those beautiful objects of art and manufactures which are the happy results of peaceful commercial relations.

It is no small honour to England to have set this noble example; and here let me quote a few beautiful lines from Mr. Cole's introduction to the Catalogue, which appear to me so descriptive of England's high position and of the feelings which should cherish when viewing the collections of the world's productions:—

"It may be said without presumption that an event like this Exhibition could not have taken place at any earlier period, and perhaps not among any other people than ourselves. The friendly confidence reposed by other nations in our institutions; the perfect security for property; the commercial freedom, and the facility of transport, which England preeminently possesses, may all be brought forward as causes which have operated in establishing the Exhibition in London. Great Britain offers a hospitable invitation to all the nations of the world to collect and display the choicest fruits of their industry in her capital; and the invitation is freely accepted by every civilised people, because the interest both of the guest and host is felt to be reciprocal. * * * The work is done, and the collection made of the productions of 15,000 exhibitors, working with the ability God hath given them. To these we may say with St. Paul, 'In lowliness of mind let each esteem others better than themselves,' and to spectators we may reiterate the hope expressed by the Prince, that 'the first impression which the view of this vast collection will produce, will be that of deep thankfulness to the Almighty for the blessings he has bestowed upon us already here below; and the second, the conviction that they can be only realised in proportion to the help which we are prepared to render to each other; therefore, only by peace, love, and ready assistance, not only between individuals, but between nations.'"

Again thanking you for the honour you have this day conferred upon me, the recollections of which will never be effaced from my memory, and also for the kind patience with which you have listened to my remarks, I conclude by wishing you the long enjoyment of health and of that happiness and prosperity which are the sure results of those enlightened views which are fast spreading over the world, and which the people of Derby have been among the foremost to advance.

The next toast given was the "Health of Mr. Paxton," which was proposed in highly complimentary terms by the Mayor.

Mr Paxton returned thanks at some length; and, in the course of his observations, alluded to the unexpected risk which the Crystal Palace had run from the recent balloon ascent.

A great variety of toasts followed, and the company separated highly delighted with the opportunity afforded them of testifying their admiration for the character and the talents of their now distinguished townsman.

[We hope to be able to present our readers with an authentic Memoir of Mr. Fox in an early Number.]

ECCLESIASTICAL VESTMENTS. BY HALLE

We engrave two other specimens of M. Hallé's rich embroidery for ecclesiastical costume. The designs are very elaborate, but of course must mainly depend for their effect upon the costly material in which they are worked.

PRIEST'S VESTMENT.—VAN HALLE, BRUSSELS.

MITRE.—VAN HALLE, BRUSSELS.

EGYPT AND TUNIS.

We now pass from the Asiatic to the African continent, and propose to take a survey of the contributions of Egypt and Tunis to the Exhibition, the former of which, in addition to their intrinsic merit, are interesting from the imperishable halo of association that surrounds the land from which they come—a land which has been the seat of four civilisations, essentially differing from each other, and spread over the lapse of 4000 years; for while Italy and Greece have been at particular periods more resplendent by cultivation of the arts, Egypt is the only country that still shows in its monuments distinct traces of four successive epochs of civilisation a Pharaonic, a Greek, a Roman, and an Arabic. This, no doubt, springs from the peculiarity of its physical geography, as a country of vast territorial wealth within a narrow space, and forming the connecting link between the Red Sea and the Mediterranean; while to the Englishman, more than to any other inhabitant in Europe, Egypt has become, since the development of steam navigation, that portion of the East the political condition of which bears most immediately on the communications between our vast Indian empire and the metropolis. There was a time, and that not long since, when our relations with the Government of that country were of the most hostile nature; but it is satisfactory to think that the most amicable intercourse now reigns between them. No Englishman in his senses thinks of a military occupation in Egypt similar to that which was attempted by France. The objects of the British Government limit themselves, first, to the exclusion of any European power from military possession of the key of the Mediterranean and Indian seas; secondly, to the development of our commerce in Egypt; thirdly, to the facilitation of the Overland route. And it is satisfactory to find, that the present Pacha shows every disposition not only to promote and protect our passenger traffic, but to cultivate the most amicable relations with the Government and inhabitants of this country.

In Egypt the extraordinary change that has been imprinted upon the administration, the commerce, the agriculture, and the manners of the higher classes (for those of the great majority of the people remain untouched) has been effected by the will of one *man*. It is true that Mahommed Ali sometimes misapplied his resources, but there can be no doubt of the extraordinary mental activity of the individual; there can be no doubt that all the productions of Europe have been subjected to study—that their application to European commerce has been tested, that the climate and soil have been studied, and that vast numbers of experiments have been made in the vegetable world, and that many plants have been successfully naturalised, while the indigenous products have been much improved in quality.

The Nile is the great feature of Egypt; let us, therefore, begin with the upper country. Highest of all, are the articles from the Belledes-Asoudin, elephants' tusks, sections of ebony from Senaar, a rhinoceros horn, and other objects from the "land of the blacks," as the term means, of which the most valuable is gum. Upon this trade the genius of Mahomed Ali, remarkable as it was in many respects, had not a favourable influence; the European regulations and police, which he established with absolute power, rather frightened away than encouraged those who had objects of this description to sell from the interior of Africa; but, as the system of the present Pacha is less stringent, there is every prospect of an extension of this portion of the trade. And to this object, unquestionably, nothing would so much tend as the establishment of a fair, once every winter, at Essowan, which is the highest point that can be reached by steamers from Cairo, and is on the borders of Nubia.

In Upper Egypt itself, the principal objects of production are dates, corn, sugar, and Indian corn; the first of which is the most striking feature of the Egyptian landscape, and which is almost as familiar to the eye of the European by thousands of faithful representations as to the Egyptian himself. On closer examination of the vases in which they are kept, we see the varieties of their colour, some being of a dark red, some of a light brown, and others of a cream colour. Not only is the date an excellent food for the common people of Egypt, but we see in this Exhibition illustrations of the varieties of purposes to which they are applied: here are the crates of the branch of the palm; the fly-flappers of palm leaves, used by servants while the masters dine; and, moreover, specimens of the cordage into which the palm fibres are made, and a coarser description of which is in universal use in the Nile boats. When we add, that the trunk of the palm is used for timber, that the nuts are used both as camel fodder and as a combustible for the preparing of human food, and that, moreover, a tenacious hairy sort of fibre from the palm is used in cleansing the skin in baths, it is scarcely possible to over-rate the value of this tree.

Sugar-canes and sugar-loaves are also to be seen in the Exhibition, the latter from Ibrahim Pacha's refinery. This remarkable man made great efforts to push the sugar cultivation in Egypt, for which there can be no doubt that both soil and climate are well adapted; but the great proportion of the sugar used in Egypt is still imported from Europe; for

whatever the will of Ibrahim Pachá may have been, or whatever may be the natural capabilities of Egypt, the incurable indolence of the people, and their indisposition to labour, seem to be an invincible obstacle to Egypt ever competing with Europe in price and quality as far as this article is concerned. The true calling of Egypt is, unquestionably, that in which Nature herself—the Sun and the Nile—have the largest share in production. It is by her wheat, her cotton, her beans, her barley, her sesame, her linseed, and her flax, that Egypt can increase her wealth with certainty. It is agriculture and commerce that manufactures, that Nature has assigned to Egypt in the territorial division of labour.

Of these the most important is certainly cotton, from the great extension of its culture during late years. We particularly recommend attention to a specimen of Sea Island cotton, cultivated by Mr. Lucking, in the environs of Alexandria. This ingenious gentleman has devoted many years to the horticulture and agriculture of the Egyptian climate, and has been the means of reclaiming from the lake Mareotis a large tract of land, which would have been otherwise useless, by diverting from the canal a portion of fresh water, which, washing away from the alluvial soil the saline particles, has left the earth cleansed and productive. He has also been at pains to introduce, upon a most extensive scale, the British system of agriculture, and the Belgian method of cultivating flax: but the inveterate habits of indolence and pilfering in the natives have prevented the experiment from being so successful as could have been wished

In the Exhibition may be seen one of those curious machines with which the Egyptians conduct their agricultural operations (marked 174 in the Catalogue), which shews that the ease-loving countryman makes his own weight contribute to do the work, while he is saved the trouble of walking. The Catalogue states that the object of this machine is to sow seed; but, unless we are much mistaken, it is the machine used for the double purpose of thrashing corn and cutting the straw; the oxen performing a rotary motion until all the straw be cut and the corn squeezed out.

Of other vegetable productions may be seen specimens of opium and senna, which are well suited to the climate; tombak, which is used as a substitute for tobacco in the water-pipes; and rice, which is grown in very large quantities on the low grounds of the Delta, not far from the sea, and cleaned for the most part at Damietta and Rosetta, where mills have been established on the American principle with great success. Nor must we, in our list of vegetable products, omit the rosewater of the Fayoum, which is so frequently mentioned in the songs of the Arab poets, whole tracts of land being devoted to this culture, and in the season of plucking diffusing fragrance through the smiling land. It is also in the Fayoum (which is a district to the west of the Nile above Cairo) that are to be found the greatest quantity of olives, large plantations of which have been re-established by Ibrahim Pacha in various parts of Egypt, for the culture of olives had much fallen off under the Mamelukes.

The mineral productions are very numerous, the most magnificent of which in the Exhibition are the slabs of Oriental alabaster, from the quarries to the south-east of Cairo, in the Desert, and out of which material the columns of the new Mosque of Mohammed Ali, in the citadel of Cairo, have been constructed. There can be no doubt, that, if the value and the beauty of this mineral were better known in Europe, and if a railway, of however rude and cheap construction, could be established to Beni Souef, on the Nile, it might become an article of export of the greatest importance. As a native manufacture, having a mineral for its component, we may also draw attention to the porous water bottles made at Ghenneh, on the Nile, which are in universal use in all parts of Egypt, from their peculiar quality of exuding the moisture, which retains the water within them in a human state. If we descend the Nile to the entrance of Cairo, we see another mineral production, in specimens of the petrified forest of a valley in Mount Mokattam.

The Cairo articles must be regarded under two aspects those which are indigenous, and those which have been introduced by the late Pacha, as subservient to his military and political system. The latter need not engage our attention, as they have no local colour, however evidentiary they may be of the superior mental activity of the family of the present Pácha. Of the former, we may direct attention to the saddles of crimson velvet, the padded one being most easy and convenient for riding, giving a good hold to the knee; but the high cantled saddle is the most interesting, for it is of the same form as that in which Saladin and the Paynim host used to receive the shock of Frank Crusader, the saddle of Negm-Eddin, whose name is so associated with the expedition of St. Louis to Damietta, being still an appendage of the Mosque, that, after six centuries, bears his name.

In no respect had Mahommed Alí, to leave his impress upon this country, been more successful than in his efforts to promote public instruction; and the schools he established in Egypt will unquestionably do honour for all his reputation than the wars in which he has been engaged. The printing-press at Boulak has been sufficiently described by travellers; and those who wish to see the Egyptian edition of the "Arabian Nights" entertainment, and other productions of typography, may do so by sending themselves being remarkable, not so much for their beauty of print and paper, in which they cannot compete with Europe, as for the excessive lowness of price.

The articles of dress are so numerous, and are brought in such quantities by travellers to this country, that we need not take up the reader's time any further; simply remarking, that, while many of the imitations of European manufactures have not been successful as pecuniary speculations that of Tunis caps, established at Fouah, has been in operation for many years, and has been eminently prosperous.

The Tunis department of the Exhibition is certainly coarse, and includes many articles of a rude description, but none is more faithfully and more truthfully characteristic. It, in fact, gives a stronger smack of Eastern life than anything else in this wonderful pile, and, in fact, it requires little or no description: it speaks for itself, and when we look at its shop, with leather bottle for holding water in the desert, its specimens of grain from the country that was once the granary of the Roman Empire, when we see its excellent, but unpretending, soap, made of olive lees and soda of the country; its sponge, which is so inferior to that of the Archipelago; its umbrella hats of wailing to keep off an African sun, and its coarse culinary utensils, we feel that this is not the luxury of Damascus or Constantinople, still less of the gorgeous descriptive poets and romancers of the East; but it is Tunis itself, and so arranged as to produce a nearer approach to the illusion of foreign travel than any other portion of the Great Exhibition.

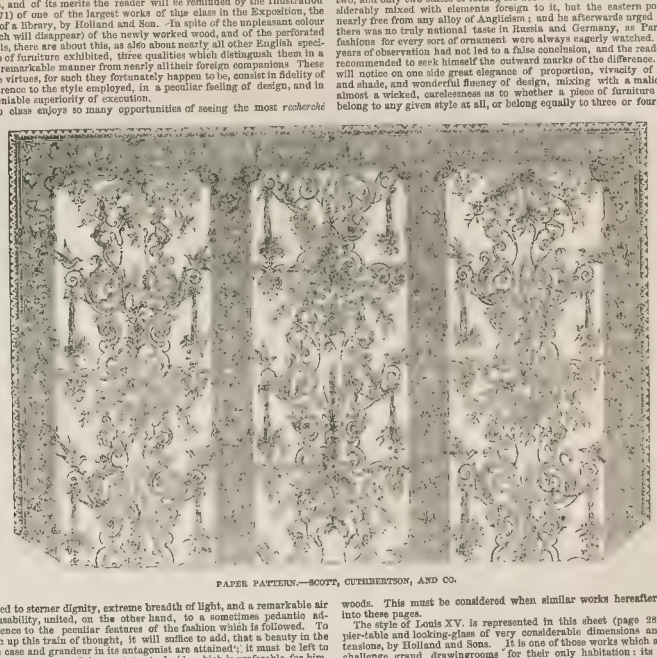
DECORATIONS, FURNITURE, &c.

A little reflection will show that the subject of furniture is infinitely more important in England than on the continent; because much more money is spent here, by the middle classes of all incomes, on the various branches of trade required to fit up a house, than is ever thought necessary in other realms. Whether upon marriage, upon taking another dwelling, or upon a plea of necessity, ladies are always ready to receive furniture from the factory to displace that which must certainly have one of two faults: either it is not fit to be seen, or it is not old enough to be valuable for its antiquity. The accumulation of this sort of property is surprising, for apartments are hardly considered to be well dressed until there is literally little chance of human motion, and no possibility of adding to the treasures. With the last century, too, expired the empire of fashions which, during the lifetime of the Sovereign whom they found upon the throne, reigned steadily over the whole of the community in solitary grandeur, without disturbance from any interloping modes; at present, the rapid succession of tastes, and of late years their contemporaneous existence, having allowed purchasers to render their saloons little more than museums for every phase of ornamental art, it becomes easy, by small additions, to incline the balance in accordance with a prevalent mania; but these additions are, for the same reason, constantly demanded.

The order in which various leading styles of decoration have re-appeared is tolerably uniform. Since the time of Louis XVI. we have had Roman, Louis XV., and Greek; then Gothic, Louis XIV., and Egyptian have followed as links of a chain terminating in Louis XV., Elizabethan, Louis XVI., Italian, Gothic, Louis XIV., and *Renaissance*. Thus, in the species of Greek, or *par excellence* classic furniture, but two specimens of high merit have come under observation: one is the ebony table inlaid with silver, by Hancock (p. 490); the other is the chair by Jeanselmé (p. 427); both are carefully moulded upon antique ideas, and deserve consideration for their inherent unobtrusive elegance. They recal the Hope* fashion, as it was set by the predecessor of the present distinguished amateur; and are interesting to those who have not frequent opportunities of seeing the as yet undisturbed interior of some of the large houses which were furnished forty-five years ago.

We appear at this time to have just entered upon the last mode of the cycle, and of its merits the reader will be reminded by the Illustration (p. 371) of one of the largest works of this class in the Exposition, the side of a library, by Holland and Son. In spite of the unpleasant colour (which will disappear) of the newly worked wood, and of the perforated panels, there are about this, as also about nearly all other English specimens of furniture exhibited, three qualities which distinguish them in a means of furniture exhibited, three qualities which distinguish them in a very remarkable manner from nearly all their foreign companions These three virtues, for such they fortunately happen to be, consist in fidelity of adherence to the style employed, in a peculiar feeling of design, and in undeniable superiority of execution.

No class enjoys so many opportunities of seeing the most *recherché* work as the Russian nobleman, when he is allowed to travel; and such a connoisseur, talking to an English acquaintance, was triumphantly proving, what our countryman could not see, that the Transept divides two, and only two states of feeling for decoration—the western one considerably mixed with elements foreign to it, but the eastern portion nearly free from any alloy of Anglicism; and he afterwards urged that there was no truly national taste in Russia and Germany, as Parisian fashions for every sort of ornament were always eagerly watched. Ten years of observation had not led to a false conclusion, and the reader is recommended to seek himself the outward marks of the difference. He will notice on one side great elegance of proportion, vivacity of light and shade, and wonderful fluency of design, mixing with a malicious, almost a wicked, carelessness as to whether a piece of furniture shall belong to any given style at all, or belong equally to three or four, op-



PAPER PATTERN.—SCOTT, CUTHERTSON, AND CO.

posed to sterner dignity, extreme breadth of light, and a remarkable air of usability, united, on the other hand, to a sometimes pedantic adherence to the peculiar features of the fashion which is followed. To sum up this train of thought, it will suffice to add, that a beauty in the one case and grandeur in its antagonist are attained; it must be left to the idiosyncracies of the spectator to decide which is preferable for himself. Taking, however, an eclectic view of the productions of each school, it will be a pleasant task to point out those productions which are best of their kind.

In the Eastern Nave, the bed, by Leistler, of Vienna (represented on p. 22), is not only one of the most sumptuous productions, but is also grander than any of its English fellows; it is, indeed, a state bed, being eleven feet long by nine feet wide, and thirteen feet high, made of zebra wood. It is an excellent example of the general criticism above enunciated: every portion is an isolated beauty; all are grouped with admirable skill to obtain relief by shadow, and (what no Briton would have been bold enough to put forward had he thought of it) the supports of the head are not like, though somewhat resembling, those of the foot. The head is occupied by a beautiful Angel of Peace in an arched niche, placed between panelled-work, and at the foot are representations of our first parents, whose place is sufficiently defined in the Engraving. The *putti* are really "little loves," and the ornaments are very effective. Here praise ends. While the foliage is Gothic, and the figures, with the decoration, Italian, the mass of the work is of modern *Renaissance* feeling; neither do the wood and the work agree well, and the execution seems hurried. The canopy (in which horrible dreams are lurking) is a vast cancer's root, a fault which shares in common with the English beds. One cabinet-maker, after looking at it minutely, said, "They have better tools than I thought."

Totally opposed in spirit is the amboyna inlaid table, by Caldecott (93), in an Elizabethan taste, and not a little marked with the dignity of simplicity which is attributed to the best efforts of London houses; the pretty arabesque border and centre have been enlarged on the same Engraving, and will serve to direct attention to the reality, which professes, as many other inlays profess, to be of unstained, f. c. self-coloured woods. This must be considered when similar works hereafter come into these pages.

The style of Louis XV. is represented in this sheet (page 23) by a pier-table and looking-glass of very considerable dimensions and pretensions, by Holland and Sons. It is one of those works which at once challenge grand drawing-rooms for their only habitation: its height alone (12 feet) would prevent its entrance into many good town houses, and the boldness of the design forces the spectator to retire as far as he reasonably can, to see it all at once. Then it appears that the frame of the mirror, which is very carefully carved as bullrushes and other aquatic plants, with birds, does not quite harmonise with the noble stand of the pier-table: this, from the dexterity of its arrangement, appears far larger than it really is; and the reflection in the lower glass, making a complete circle, doubles the little orchestra which nestles at the base: here no trickery of workmanship is employed; the back is finished for equal effect with the front, which is in the very best period of the style. The shape of the glass frame must not be unnoticed.

A very little consideration will show that the beautiful little walnut-wood frames from Tuscany (page 522) are not very far removed from the group (page 23) produced in the East Indies, in so far as the fashion (Roman) of the time of our Charleses is concerned. The *Dalbergia latifolia*, or blackwood, somewhat resembling veined ebony, and new to cabinetmakers, has been worked at Bombay and Madras, from designs by the London carver, Loggers, into a table, flower-stands, tea-caddies, a candelabrum, and chiffoniers: a specimen of each of the three last is before the reader. It is interesting to perceive that the native operatives have not conventionalised the details, but appears to have kept, more truly than the Chinese habitually do, to the spirit of the original. This, if correct, clearly betokens a feeling for art in our Eastern fellow subjects which may lead to serious, though by no means grave consequences.

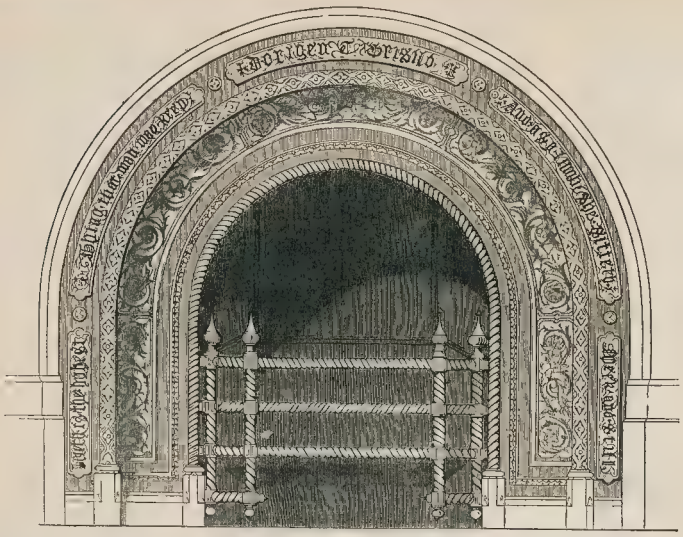
The Louis XVI. grate (page 427), by Pierce, on which considerable pains and thought have been bestowed, is a mass of brilliancy from the use of bright steel and or moulu, and is hardly so happy as usual in the

PAPER PATTERN.—MESSRS. TURNER AND CO.

fender; it is less attractive, therefore, to the critical eye, than the specimen (page 427) exhibited by Baily and Sons. Their style (Italian) has been happily chosen as admitting the introduction of glazed tiles, with floral devices. The dogs merit the honour (page 426) awarded to them, of a separate Illustration; the eagles being very carefully and spiritedly modelled; but the lower or moulu portion, which contrasts strongly with the silvery globe, is still better worked. But the grate by Jeakes (page 24) is one of the most chaste and novel that has appeared for a considerable time. Steel, inlaid with yellow ornaments, is again the mode of manufacture; but, in effect, it is very different from those just mentioned.

The position which it is destined to occupy is indicated at page 394, where the other portions of the decoration account for the peculiar phase of the Elizabethan style which has been employed. The fender is equally an object of merit for its variation from the usual arrangement of such objects.

Bach sends from Paris two window-blinds, or transparencies; one consists of a landscape, of which the most prominent features are a peacock seated on a pedestal, and also a vase of flowers placed on the same pedestal: this is far less creditable than the other (shown on p. 28), in which all the necessary light has been kept in the flowers,



STOVE, BURNISHED STEEL, INLAID WITH GOLD.—MESSRS. JEAKES AND CO., GREAT RUSSELL-STREET.

gaining all their natural brilliancy without losing breadth or general light; the design is a very pretty arrangement of colour, and is full of it, as, according to the Watteau style, it ought to be.

There does not seem to be any good reason for stating that the manufacture of paper-hangings, printed from blocks, can be traced earlier than the 17th century, when flock and coloured papers are sufficiently described to show that they were in their infancy; at the end of the century, however, they had grown to be an object of Parliamentary attention, and were taxed.

This did not so much impede their progress, and in 1770 the English makers taught the French, whose execution and design were inferior; and they retained their superiority until the last fifty years. From that period, paper-staining has been a favourite branch of manufacture in Paris, and it is only within the last ten years that the London houses have begun to re-assume, if not their superiority, at least their equality: at present, a French maker expresses his opinion that there are no very wonderful specimens in the Building, and that the continental are certainly equal to the English works.

In 1754, Jackson, of Battersea, a manufacturer, published a pamphlet on the invention of printing in chiar' oscuro, and its application to paper-hangings, which he executed in imitation of the most celebrated classic subjects; and various attempts have since been made in the same path: the last, and one of the boldest, is that of Jeffrey and Allen (engraved on this page), who have used what they considered the best portion of the Elgin frieze without any repetition, in twenty-four feet of length: the particular colouring appears to have received the attention of Messrs. Owen Jones and Digby Wyatt. This will be found on the south side of Bay E 75 (on the ground-floor).

Scott, Cuthbertson, and Co. show a simple and handsome Tudor panelling in the Eastern Gallery. The effect of the gold upon a white ground, as the paper is hung, is necessarily much softer than the drawing will suggest: the border, however complex, is by no means confused; much of this may be owing to the quantities of colour, which, as in their other paper already illustrated (p. 498), is a bold attempt at reconciling apparently equally forcible colours.

Turner's *cerise* pattern is particularly elegant and lady-like. These patterns demand unusual attention, on account of the precision claimed for the manual labour of printing the blocks. The test is very simple, and the same part of the sheet of paper may receive ten or a dozen blows from the blocks without slipping, or causing a faulty impression.

CARVED BRACKET.—ROGERS.

This pattern is a design by Marchand of Paris. Underneath it will be seen two patterns, which possess the property of altering their appearance as the eye of the spectator moves, becoming alternately light on a dark ground, and dark on a light ground patterns. This effect of "glancing," as it is now termed, has not been introduced by this house so much as twelve months, and is still a novelty. They are in the same South Gallery (France).

Townshend, Parker, and Co. have an arabesque paper pattern, quite good enough for hand painting. This certainly stands a chance of being considered the most praiseworthy of this class of productions. Their plain flocks on each side of it (p. 534) gain by the contrast: for their purity and neatness of outline, joined to the solidity of the flocking, are well set off by the general deep tones of the arabesque. As being especially worth consideration, their position should be indicated. It is in the agricultural machinery (Class 1.), and on the back of the wall of the Sculpture Court (*i. e.* Bay Q, 27).

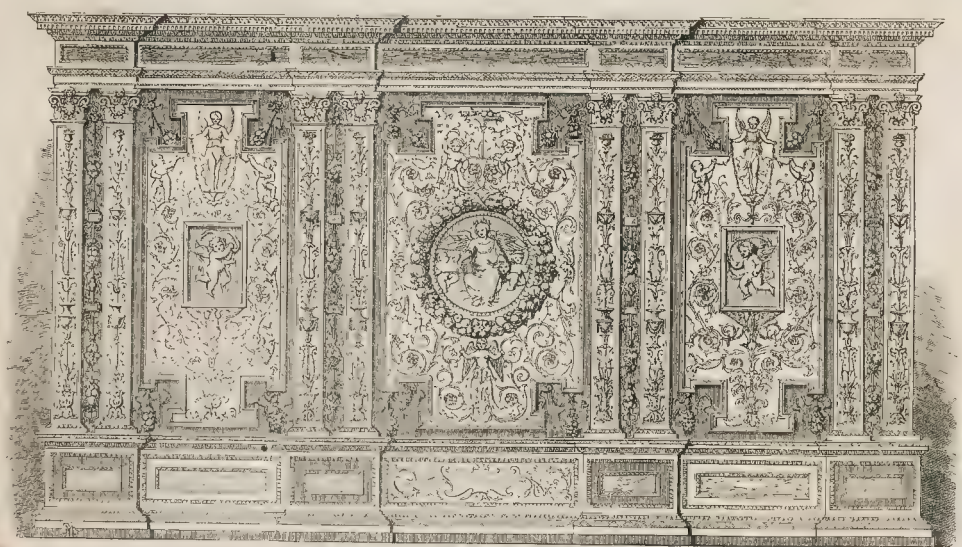
PAPER PATTERN.—JEFFREY AND ALLEN.

BRACKET. BY W. G. ROGERS.

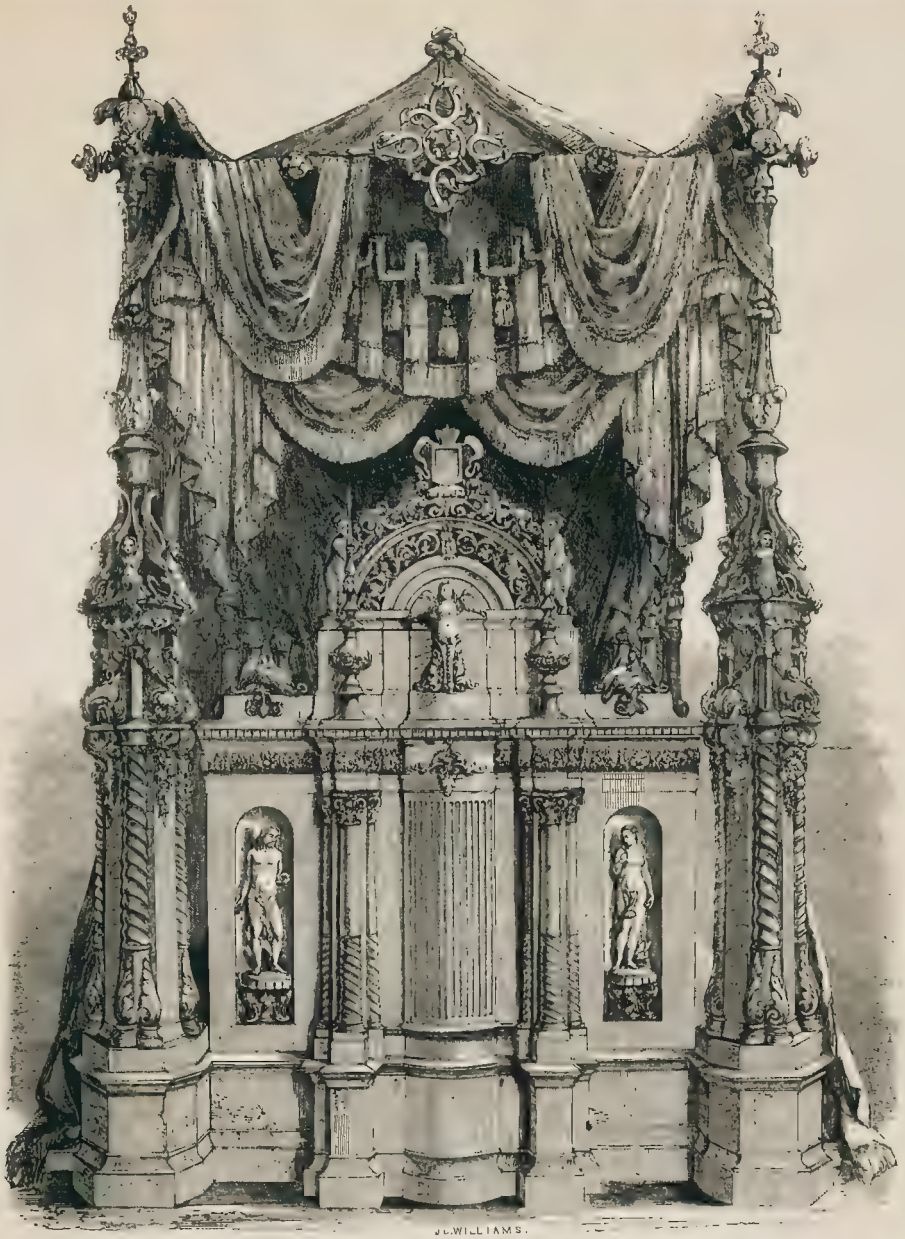
This is one of two brackets exhibited by W. G. Rogers, showing a combination of carved wood and porcelain; the boys in the latter material executed by Chamberlain, of Worcester, from models by the exhibitor, are sitting in a mass of foliage gilt and burnished. The style is decidedly *rococo*, but may occasionally prove effective.

ORNAMENTAL CABINET. BY DOWBIGGIN AND CO.

A richly ornamented commode exhibited by Messrs. Dowbiggin and Co. stands in the front of the furniture department in the Western Nave. The design is by Gruner and is very chaste and beautiful.' It introduces various coloured woods, the panels being ornamented with marqueterie and carvings; and there are paintings upon china after Raffaelle, in the centre, as well as on the pilasters. The whole is finished with richly gilt mouldings. Altogether we have seldom seen a more elegant production of the kind.



INLAID CABINET, DESIGNED BY GRUNER.—BY MESSRS. DOWBIGGN.



AUSTRIAN BEDSTEAD.—BY LEISTLER.

BALMORAL CASTLE, IN WOOD. BY J. H. GRIGG.

This is described as a "mechanical picture," being composed of 700 pieces of wood, all natural colours. It is exhibited amongst several other works by the same person, J. H. Grigg, of Banwell, Somerset, who describes himself as a "wood artist," but which are only remarkable for the curiosity of the thing.

ORNAMENTS IN PAPIER MACHE. BY BIELEFIELD.

The specimen of *papier maché* ornament which we engrave in our present sheet will tend to illustrate the variety of subjects to which this material is applied at Mr. Bielefeld's establishment.

RUSTIC PICTURE-FRAME, IN WOOD MOSAIC.

THE BUILDING STONES AND SLATES.

Few persons not directly concerned with the actual construction of large public buildings have any idea of the great importance of selecting fit material for such purposes, and fewer still, perhaps, were aware, till the study of the Great Exhibition might suggest the fact, that there exists in our own country a large and varied series of such material, including almost all the kinds of stone known in the world. A notice of the building materials, therefore, and a comparison of the English with foreign articles of this kind, will be found useful and interesting.

There are so many different uses for stones that the subject requires some subdivision. Thus, we have freestones of all kinds, rags, flags,

PAPIER MACHE ORNAMENT.—BIELEFIELD.

slates, paving material, freestone, &c.; and these are composed of limestones, sandstones, clayey limestones, clays, granites, porphyries, basalts, &c., according to circumstances. It requires some little attention to discriminate amongst these, and recognise the material that is of real value and best adapted for any special purpose.

Speaking generally, we may say that the building stones abundant in England are limestones and sandstones, chiefly belonging (geologically) to the secondary series of rocks; that the slates are chiefly and entirely met with in rocks older than any of the former, whilst the granites and porphyries are older still. The tertiaries afford little stone except in the Isle of Wight; but some important sandstones are met with in the carboniferous series. The intruded trap rock, of which a large proportion is of good value for roads, but not for more delicate work, is of very ancient date but of limited range. The age and position of similar rocks in other parts of Europe are often altogether different, but the enduring power of the stone is not a little dependent on this part of its history. Our architectural readers will not fail to appreciate this when they examine and compare the materials which we are now about to direct attention.

It may be well to consider the materials exhibited by different countries in order; but, as a matter of course, the English group will be found far more extensive and complete than the others, since the cost of transport would alone deter the proprietors of foreign stone and slate quarries from sending large and fine samples of their produce. The English is, indeed, almost the only collection that is in any sense complete, although from abroad there are several most interesting specimens of material of great beauty, including some examples rarely seen in this country

Granite is a stone so difficult and costly to work, that it is rarely used except for public monuments and for ornamental purposes. There are too kinds chiefly known in England, and both are well represented in the Exhibition—the Cornish and Aberdeen. There is a good deal of difference betwixt these, though both are excellent. The column exhibited by the Chevassutting Granite Company, and erected on the right-hand side of the West entrance outside the Building; is a beautiful instance of the colour, texture, and sharpness of the stone, and is a granite well worthy of note. The shaft is a single block admirably worked and faultless in quality, and is remarkable as being from a quarry only recently opened It will be interesting to compare it, for colour and texture, with a large cross erected at the east end of the Building, of grey Norway granite, in about the same state of manufacture.

Two other remarkable monuments of Cornish granite are placed as ornamental objects outside the western end of the Building, both of them being obelisks, and both single blocks of great interest One of them is exhibited by Messrs. Freeman, who have supplied by far the most extensive single collection of raw material in the Building: and the other by Mr. Hosken. These obelisks are left rough but are carefully tooled, and show the sound quality of the stone. Other granites partially worked will be found in Class 1., especially slab, showing different styles of dressing, exhibited by Mr. Wellwood Maxwell (No. 134), of D'Albeartie (Kirkcudbright), and some granite balusters from Inverary (137). These two latter, being Scotch, may be compared with advantage with the Cornish specimens; and we would also direct attention to an interesting bust and pedestal of blue Peterhead granite, by Mr. Hutchison (141) The common granite, porphyries and dians of Cornwall, as adapted for building and road purposes, are well shown in part of Messrs Freeman's series, and the collection immediately adjacent, sent by several of the Cornish local committees.

Of polished granite and porphyries, a fine collection from Cornwall will be found exhibited by Mr. Meredith (Class 1, 141) and Mr Pearce (Class 27, No.): The former has sent chiefly slabs; but the latter exhibits also chimney-pieces, pedestals, and other objects very remarkable both for style and execution. It will be interesting to compare them with the admirable specimens of polished granite sent from Aberdeen, by Messrs. Macdonald and Leslie (74), and a finely worked headstone of the same material, by Mr. Wright (43). The large size of the Kinnar crystals in Mr. Leslie's polished granite is not a symptom of durability, and the beautiful red variety shown by Mr. Peterson seems to be a kind of doubtful value in this respect; but we may well point to these objects as deserving of great credit among mineral manufactures, and certainly well adapted to the purposes for which they are designed.

There are not many specimens of foreign work of this kind, but the few that have to be mentioned include some of the most remarkable and difficult specimens that could be referred to. From Berlin (Zollverein, 235, but exhibited) we have a fine red porphyry tazza and slab, both of exquisite finish, and worked in a most difficult material; while from Sweden and Russia are examples of porphyries and jaspers, exhibiting an amount of labour rarely to be obtained, except where the reward of labour is inadequate, or where, for some special service of luxury, economy is disregarded in the administration. The vases in question, constructed of materials which, so far as difficulty of working is concerned, may be regarded as gems, are marvellous instances of finished skill in the material in question; and we would notice them especially in this way as a contribution, for the same reasons as those which induce us to wonder at the labours of the ancient Egyptians in erecting pyramids, and constructing temples out of the solid rock.

If we pass from granites and porphyries by way of the jasper, the next step is but trifling, so far as material is concerned, but involves a difference of condition which makes a vast difference in its usefulness. The jasper is little more than quartz, and the sandstone differs still less, but the difference between sandstone and jasper being indeed wide, so far as appearance is concerned. Sandstones are extensively used as building materials in England: but, as most of the quarries that yield good qualities are distant from the metropolis, as the cost of transport is heavy, and as other cheaper and lighter material is near at hand, it is no wonder that few of these are commonly used in London. Perhaps the Kentish rag is the best exception, but of this it is singular that no specimens have been sent for exhibition, except by Mr. Freeman, as a part of his large series

There are several fair qualities of sandstone used for building, and some are excellent, amongst the most remarkable being that from Craigleith, near Edinburgh, admirably illustrated by some dressed specimens, and also by a couple of sculptured groups in this material, showing the whole face of the stone perfectly. We would especially attention to Mr. Gowan, the exhibitor of these groups (Class 1, 132), as supplying the finest specimens of freestone and sandstone, and as showing some contrivances in quarrying which do him the greatest credit. The Craigleith stone is in the carboniferous series It consists of 98½ per cent. silica, and 1 per cent. carbonate of lime. It is not very heavy; is very strong, and works well into landing-steps, pavings, &c., for which purpose it is well known in, and much used in London. The quarries are large, and the supply inexhaustible, but the stone is rather costly. Besides the Craigleith, which is the best, several other sandstones are used for buildings in Scotland, and some also in the coal districts of England. The colour is often dingy, the stone containing carbon and a little mica. The stone endures exposure admirably.

The millstone grit of Yorkshire supplies excellent material, not only for construction and paving, as seen in the objects exhibited by Messrs. Brown, Rusby, and Booth (outside, West End, No. 20), but also for grindstones, of which several, two of very unusual dimensions, are seen in the same part of the Exhibition (outside, West End, 22, Haywood Bros. and Co., and Co., 24). This material consists of small quartz pebbles, embedded with finer grains, and cemented very firmly with a siliceous cement. Elsewhere the cement contains argillaceous matter; but the unequal hardness of wear of the material ensuring a constantly rough surface, is the main recommendation for millstones.

Although little building material from the old red sandstone has found its way to the Crystal Palace, there are not wanting some fine samples of the excellent pavement from Caithness flagstones quarried from the slabs of the bituminous schist occurring there, and belonging to this part of the geological sequence. A part of the pavement outside the West extremity, exhibited by Mr. Sinclair, is of this kind, and the different kinds of surface, which may all be seen, are interesting illustrations of the condition of the stone

In addition to the sand and grit-stones of the carboniferous series, already referred to, we would direct the attention of the practical man to the Leeds stone, exhibited by the executors of Mr. Walsh (No. 153), the Bramley Fall stone, used for docks, bridges, &c., and exhibited by Mr. J. Rutherford (182); and the Dean Forest stone, by Mr. Townsend (No. 186). There are also several other examples of sandstone in the immediate vicinity, and together they will amply repay half an hour's careful examination. The sand-stones shown by Mr. Freeman, as used in London, and belonging to the older group, are repetitions of these, with the addition of Darley Dale, a material of first rate quality. There is a good specimen of the paving stone of Penmant grit, near Bath, sent by Mr. Sparks, of Crewkerne (186)

Sandstones of a newer date, chiefly belonging to the new red sandstone series, are exhibited from Liverpool (an interesting series); from Bristol, by Mr. Howard, (29), and others. They are good of their kind, but the texture of such stones is rarely sufficient to justify their use extensively in important works. The Hastings sand yields some hard and good building material in Tilgate Forest, and the lower greensand has already been mentioned for its kentish rag.

Of foreign sandstones, the most remarkable and interesting are those used for millstones. They are not generally obtained in such large blocks as is the case with the Derbyshire, but the stone is more compact, less gritty, and is already in holes. Such is the burr-stone of France, greatly used and much valued, and apparently answering its purpose extremely well. Several varieties of this stone are forwarded, both by French and Belgian exhibitors, and these form an interesting contrast with the millstones of Hayward (outside, West, 23), and Bedford, Hanson, and Co (outside, West, 24), which are of noble dimensions, from our coal grits, and also with those from the Rhine provinces of Prussia, where a volcanic stone of great hardness and roughness is used for the same kind of work. The English specimens are worth examination for their large size and uniform quality, but the French and Belgian are very ingeniously manufactured, or built up of distinct blocks, cut into such zig-zag forms that the tendency to break by centrifugal force, while in rapid revolution, is counteracted by the bond of one block with another. This may be easily seen and understood on examination.

Limestones (carbonates of lime) are employed for construction in very distinct forms; sometimes crystalline, as the finer kinds of marble; sometimes less perfectly crystalline, still forming a common marble; sometimes oolitic, as is the case with the common building varieties in this country; sometimes compact, as in many foreign varieties; sometimes mixed with more or less clay, but still available, as our lias limestones; and sometimes with a large and distinct admixture of carbonate of magnesia, as in the case of the magnesian limestone of Colombia, one of the best building stones of this country. The finest varieties of white crystalline marble—in former times the Parian and Pentelic marble obtained from Greece, and more recently the Carrara marble from Tuscany—have been employed by the sculptor to perpetuate his works of imperishable art. The more beautiful and the rarer varieties of coloured marble, as the verd antique, rosso-antico, giallo-antico, and some others now not easily to be obtained, are also used only for ornaments, and need not occupy us here in the reader's attention to some fine and interesting examples exhibited by Greece. The commoner marbles of our own country, France, Belgium, and Germany, are generally not only coloured, but distinctly veined, and their value depends on the absence of any great amount of the separation of the veins and patches of colour, and a possibility of getting large blocks of equal quality and texture at a moderate cost. In the actual use of the commoner marble, our Continental friends have long been far ahead of us, and evidence of this is seen in the multitude of slabs and specimens, worked for the most part thin, and with little regard to expensive forms, and showing an application in which cheapness is more important than finished workmanship. The marbles of Languedoc and the Pyrenees exhibited by France, the marbles of Belgium, those of Spain and Portugal, and those of Italy, are well worth attention in this respect.

England is chiefly dependant for marble on the counties of Derbyshire and Devonshire, although beautiful material of the same kind occurs in Scotland and Ireland. The varieties of colour are numerous in both districts, but the material is somewhat brittle and rather expensive in working, at least as compared with the abundant and low-priced marbles of the Continent. The black marble, used a good deal for chimney-pieces and other house decoration, is of excellent quality, hard, and takes a fine polish; and samples are not wanting from Belgium and England. Of the former we may mention a very good and well-worked mantelpiece, (in rather a large scale, exhibited by M. Noirsaint, in the exit passage near the Sculpture gallery, and fitted with its stove at Birmingham. This may be contrasted with the Derbyshire black marbles in Class 27, which show most of the common applications in England, and indicate a large preponderance of ornamental work, not always in the best taste. Of the Devonshire marble, there is a fine table from Devonshire, by Mr. Bovey, in Class 27; a large table and some columns by Mr. Champernowne—the latter occupying a prominent position in the Nave—and several smaller articles. A magnificent table and slab are exhibited by the Lunnon Company, but the localities of the marbles are not named in the Catalogue.

Several specimens of workmanship in white marble, chiefly for chimney-pieces, are exhibited from various countries. The English are not very remarkable; the Belgians, perhaps, on the whole, the best (Leclerc, 238), but there are several of tolerably good design and workmanship from France, and some of great pretension and high finish from Milan, in the Austrian Sculpture Court. As specimens of working in marble, they deserve some attention, but there is in most of them an absence of perfect finish either in the use or material of execution. More successful in taste, and even more excellent in detail, is a very beautiful tazza of Oriental alabaster (Egyptian), sculptured and exhibited by a Roman artist, M. della Moda, and placed in the Nave, near the Roman compartment. It is difficult to imagine any work finer than that displayed in the handles of this vase; but there is no undue attempt at showing off the work, which so frequently spoils the effect of an otherwise good design. The material in this case is of the rarest and most beautiful quality, being translucent, and the base a block of the curious stalagmitic carbonate of lime, anciently worked in Egypt, and of which the quarries have recently been re-opened. Blocks and slabs of the same kind of stone are exhibited in Egypt:

It would not be fair to pass from the consideration of the ornamental marbles, without referring to the exquisite beauty of the green marble of Connemara, exhibited both in Class 27, and also by Mr. Freeman, in Class 1. There appears to be no limit to the supply of this kind, and it is rather singular that it is not employed more into consumption. There are some very beautiful slabs of red marble in the Nave, from a Berlin exhibitor. Several interesting specimens of Irish marble, of different kinds, are exhibited in Class 1, by Mr. Long and Mr. Manderson.

The common limestone in construction in England are the Bath, Portland, and several from the midland counties, among the oolites and the magnesian limestone, among those of older date. Caen stone is also much employed for internal work, and in some places for the exterior of buildings of important character All these are well represented, and for the most part by large series both of blocks and manufactured stone. The Purbeck and Petworth stones and the Forest marble, are shell oolites, that bear a certain polish, and may be regarded as forming a group intermediate between common limestone and marble.

The Bath stone is exhibited by Mr. Howard (Class 1, 29), and Mr. Freeman (160), and worked specimens by Mr. Vaughan (Class 27, No. 2•) and others. The vase shown by the latter is a good instance of the quality of the stone, and the degree to which it is capable of chiselling; and a sculptured cat on the table of Mr. Moreland (Class 27, 60) is another illustration of the same kind The quality of Bath stone is well known to be very indifferent where the objects constructed of it are exposed to the weather It is, however, abundant, easily worked, and cheap, and that will always recommend it.

Portland is one of the best building stones obtained from the oolitic rock, and is surpassed by few materials of its kind in this country. It is chiefly worked in the quarries in Portland Island. Excellent samples are shown by Mr. Foot (Class 1, 120), the latter of whom presents us with the worked as well as rough stone. We believe there are no sculptured works of any size of Portland stone, but there is no difficulty in London in seeing examples of it, as it is employed in many of our finest public buildings, and amongst the rest in St. Paul's Cathedral

The other oolites are shown by Messrs Kirk and Parry (170), who exhibit Ancaster stone (Lincolnshire), a very beautiful material; Mr. Preston (138), and others. Some of these stones are well known. Caen stone, also, an oolite from the coast of Normandy, and Aubigny stone from the same district, are exhibited chiefly by English agents (Luard and Co., No. 176) and English sculptors, the latter being very numerous. We may mention, as specimens both of the quality of the stone and excellence of workmanship, the font by Mr. Eyles, in Class 27; the niche with figure of St. Peter (Lane and Lewis, No. —), and two monumental works in the same class. One or two objects in the Nave, of the same material, will also attract notice, but are not so well worthy of close examination. The sculptured carvings in Caen stone, by Mr. Myers, in the Mediæval Court, are especially remarkable.

The magnesian limestone, well known as being the stone selected for the outside work of the Houses of Parliament, is exhibited by Mr. Grissell, the builder, and also from by Mr. Eyles, in Class 27; the niche with figure of St. Peter (Lane and Lewis, No. —), and two monumental works in the same class. One or two objects in the Nave, of the same material, will also attract notice, but are not so well worthy of close examination. The sculptured carvings in Caen stone, by Mr. Myers, in the Mediæval Court, are especially remarkable.

The magnesian limestone, well known as being the stone selected for the outside work of the Houses of Parliament, is exhibited by Mr. Grissell, the builder, and also from by Mr. Eyles, in Class 27; the niche,

HABITATION, AS EXEMPLIFIED IN THE GREAT EXHIBITION

We have already presented articles upon the food and clothing of man as portrayed in the Exhibition. We now proceed to the third of the series—the dwelling or habitation—which will complete this portion of our subject.

Great changes have taken place in the architecture and appurtenances of human abodes since Babylon was built, and Queen Semiramis ascended her giant tower to look afar for the possible invader, or lounged in her hanging gardens in the golden radiance of the assyrian sunset. Yet Babylon contained mighty palaces and temples, vessels of gold and of silver, paintings and sculpture, and all the luxury of a great defunct civilisation. Doubtless, thousands of workmen had carved and adorned the furniture of her Royal halls. Yet, with the aid of modern machinery, these same workmen would have furnished the palaces of a hundred Semiramises in less than the same period of time, and with infinitely greater ease, convenience, and splendour. The house of a London shopkeeper contains appliances, chattels, and decorations, which Persian kings and Roman emperors would have envied, and for which an adequate substitute would be vainly sought in the cities of Ctesiphon or Byzantium, could we call back the wheels of time, and effect the resurrection of those ancient capitals in all their pristine glory.

Yet we must not be blind to the great fact, that, from the time when history sees itself in the clouds of mythology which deck the inaccessible heights whence pours the stream of human records, rich people—men who could command and direct the labour of their fellows—have ever been amazingly comfortable and well housed. The prime virtues of a dwelling for man are very simple, and have been more or less the prerogative of the wealthier classes since dwellings were built. These virtues are solidity, to resist the elements and the attacks of foes, bestial or human; and spaciousness, for the free circulation of the air, light, and the movements and ordinary dispositions of the inhabitants. So essential are these two radical qualities, that their absence can be atoned for by no amount of internal details. Indeed, who would not prefer a suite of vacant rooms, in a well-built mansion, of good dimensions, and with lofty ceilings and windows, though their furniture consisted but of a few thick mattresses or the trunks of trees for tables and chairs, with the ample well-boarded floor as sideboard, bedstead, and bookcase, to a cottage such as one sees occasionally, in the rooms of which one can scarcely turn round without overthrowing a piece of furniture, while the low ceilings and narrow walls produce a closeness and impurity of air which nothing can entirely dispel; where the light, reflected and broken on every side, dazzles and annoys the eye; where everybody is in everybody's way; where nobody can do without being overlooked; where music is an absurdity, and exercise an impossibility; where, in short, were the walls of satin damask, the carpet of Turkey's softest woof, the chairs and sofas of richest velvet, and the furniture a combination of gold, marble, and the costliest woods of Eastern groves and Western forests, one would yet feel like a pig stuck into a cribbage-board, or a curious Moslem who had ventured into a pew. We appeal to those who have known the luxury of *space*, whether they would resign it for any other quality in a dwelling. Then, again, small houses and rooms are much more subject to damp, draughts, smoky chimneys, the annoyance of bad drainage, and many other architectural imperfections. It is unnecessary to observe on the sanitary advantages of spacious apartments.

Now, as the great end of civilisation, progress, and commercial industry is non only to increase, but to extend comforts, and give daily to a larger number of men the advantages enjoyed by a smaller one the day before, we had hoped to have seen in the Great Exposition of all Nations architectural plans and models of a more original character than our anxious search, and the very imperfect catalogue, have enabled us to discover. If, therefore, we have overlooked any enterprising and ingenious suggestions of the sort, we shall be glad to be reminded of the inadvertence. Meanwhile, before considering the various productions in detail for the aggregate improvement of the comforts of human dwellings we shall, glancing from one terminus to the other of architectural progress, endeavour to draw a few leading conclusions from their consideration.

In the department marked "Tunis," and in the centre of that department, stands the tent of an Arab chief. Over, which is hung to most visitors of the Titan glass-house. It attracts notice, and suggests fanciful reverie, by its rude contrast to the wonders of industrial art around it. There is no "humbug" about that old Arab tent, no devil's-dust "designed to astonish" visible in its texture. It was made from the hair, to be transported on the back of a camel; and, like that faithful "ship of the desert," it will serve a careful master long and well!

Such tents threw their shadows on the plains before Babylon arose of Memphis was a city. Constructed originally of the skins of animals, they are the first step in domestic architecture, after the shade of the tree or the shelter of the mountain cave. They do not pretend to do much. To exclude the sun's burning rays, to shelter from the rain, to defy the prying gaze of curious eyes—such are their simple virtues. In passing along, we mind, this rough stranger from the sands of Africa seems to look up smilingly at the crystal dome above, in quiet consciousness of its natural and primitive worth, yet with full appreciation of its protector's incomparable greatness. For, truly, this tent and the house which covers it are the two extremes of which we spoke.

Reviewing rapidly the intermediate stages of the builder's progress, Egyptian vastness, Grecian beauty, and Gothic elaboration by turns dazzle our eyes and chill our hearts for the hopes of modern architecture. We are but imitators, after all, in the ever-recurring, ever-saddening reflection. But a whisper is abroad. From time to time we meet with young enthusiastic architects, who aspire vaguely to a new style of architecture. The word *iron* is muttered, and an iron age feebly takes takes up the scandle. Iron pillars, iron bridges, iron ships are built, and landed. Iron palaces, iron houses are yet banished to the land of Utopian visions. How difficult it is to shake off the old superstitions in practical life! Even in the nineteenth century theory and practice are still spoken of as opposing poles. The *thinker*, the practical workman, is not yet fully honoured or rewarded. But his day is coming. He can wait a little, for is he not to govern mankind as soon as they can get but the rudiments of schooling? Then, indeed, he will say to the world, "Go this!" and they will do it; "Go!" and they will go. Because *then* the man who *invents* will be *understood*; and execution will follow design.

At length the hour strikes, glass and iron are wedded. The dark strong father of the caverns and the steam-engine clasps the young daughter of fire in his grooved embrace. It is a glorious marriage. Glass is the emblem of mind; it exists, yet is itself unseen: of glass are formed the lenses of the telescope and the microscope, the retorts of the chemist, the tube of the thermometer—its mission is to enlighten and to let in light. Iron is the symbol of matter; its mission is to work, and its attribute is force. Thus the Palace of Crystal and of Iron was erected.

Apart from its present use and present contents, it is a grand prophetic indication of future architecture. Through its transparent walls may be seen by the eye of one accustomed to follow the fertile growth of an idea, whole hosts of wonderful constructions. Propositions formerly scoffed at cannot now be treated otherwise than with respect. For example, some half-dozen years ago, the erection of a glass thoroughfare, supported by light columns, along the principal lines of street in the metropolis, was suggested. This, whilst protecting foot passengers from rain, would of course be free from the objection to ordinary colonnades (and we lish proved fatal to the palace of the Quadrant in Regent street), that they intercept the light. In summer, the shop-keepers, by letting down their awnings *over* the glass, would escape all the trouble of the present clumsy contrivance, with its projecting irons, to which so many a broken head and crushed beaver is indebted. What six years ago was regarded as a gigantic enterprise, must now be accepted as a commonplace piece of policy. For what shopkeeper would rationally object to at expense of a few pounds to secure his customers a dry promenade, and the opportunity of inspecting his goods in all weathers? and what individual of any class would object to a plan which would enable him to walk from one end of London to the other dry-shod, saving him an infinity of expense in damaged clothes, shoes, cab-hire, doctors' bills for colds, *entre* for want of exercise &

Imagine the luxury of a covered way along Oxford-street, Regent-street, Piccadilly, the Strand, Fleet-street, Ludgate-hill, and Cheapside, when of business and locomotion, who get so often wet through while waiting for an omnibus, when all are "full inside," and the conductor carelessly hints that there is "room on the roof;" to pick locks and [illegible] umbrellas, or painfully stand up in doorways, or plunge frantically into dump vehicles—whence colds, coughs, rheumatism, inflammation, sciatica, and a host of evils too numerous to mention! Do not your mouths water? Say rather, do not your dripping coats feel dry at the bare imagination? Why, Paris, with all its vaunted arcades and colonnaded Palais Royal (National, we mean), will have to follow humbly in our wake.

If to the above improvement were added Mr. Stephen Geary's system of paving, London would indeed be a marvellous city to a stranger. This paving consists simply in laying down four or more lines of broad flat stones for the wheels of carriages, carts, &c., with ordinary paving between them for the horses. It is, however, perfectly level, and can be pressed at any part, precisely like an ordinary road. The idea is not new, except as to its extended application, for specimens of such paving may be seen in some narrow lanes in the city. It is, however, as rational as it is simple; and the exposition of Mr. Geary's model, in which the Palace gives us an opportunity of drawing the attention of the Paving Commissioners to the project. Every omnibus would, if this system were adopted, run virtually on a railroad; and, were a system of periodical stoppages at distances of, say one furlong, substituted for the present indiscriminate hailing and setting down, metropolitan locomotion could be immensely facilitated and reduced in cost. No one, by this plan, could be forced to walk much above a hundred yards, and as each of the *stations* would be *covered*, and lighted by a model, it would be much easier and pleasanter than at present, both for driver, conductor, horses, and passengers. Moreover, payment according to distance could be much more equitably regulated.

We now turn to the examination of the various objects exhibited, with reference to their value as adding to the comforts of human habitations. The first thing that strikes the observer in the Great Exhibition in this head is the immense variety of the materials employed, and the numerous uses to which each individual material is adapted. Each particular substance asserts itself as an universal genius, and seems to contemplate a monopoly of the industry of man. This Great Exhibition, and others like it, must have the effect of damping such inordinate "Jack-of-all-tradeism," and, by the means of comparison offered, decide the most appropriate and advantageous field for the development of the several capacities of the materials in question.

A striking illustration of this expansive tendency is offered, on entering at the East entrance, by the American fabrics of vulcanised india-rubber, which (not to mention the trophy of intemperate tubular lifeboats) show maps, floor-cloths, flutes, boots, and doors on the sides of drays, veneered with india-rubber. Some of the maps are printed on a texture as fine as silk, and, besides a rare delicacy of printing, can neither be torn nor injured by water, and, moreover, possess the curious property of self-mangnifying, as they may be rolled up double their original size in every direction with the greatest ease. For travellers, such maps have also the peculiar advantage of never creasing, however carelessly they may be crumpled together and thrust into the pocket. The floor-cloths and table-cloths, on which large maps of the world are printed, cannot be too much commended for their useful, instructive, cleanly, and economical character. Messrs. Goodyear, the patentees, exhibit a variety of textures of india-rubber in combination with wool, linen, &c., for carpets; and globes, which can be inflated or put into the pocket at pleasure.

A bath of soapstone, also in the American department, suggests a jocular reflection from its very appropriate title. But in reality this stone, from the ease with which it is cut, may prove a great benefit to our western friends of water-loving habits. Passing over to the other side of the way, we are interested at once by the patent excelsior bedstead, by Beljiman Brothers, of 57, John-street, Clerkenwell. This bedstead is of wood, entirely put together by peculiar dovetail joins, without bolt or screw. It is impervious to vermin: no slight recommendation, if the fact be as stated

The display of Canadian timbers is curious, and affords proof of the rich stores of wooden wealth with which the forests of North America abound, whilst the arm-chairs from that colony show that the Indians are not backward in the artistic application of their resources. On entering the hardware department, we pause to admire some tea-trays, in *papier maché*, by F. Walton and Co. These trays are adorned with subjects from Retzsch's outline of "Faust," and indicate a progress in taste and judgment in the tea-tray art, which merits encouragement. Passing some fire-proof safes, by Chubb and Tannis, which suggest a general reflection on man's successful contest in so many ways with the dread devouring element, we enter the Mediæval Court, and though we would, rather see our own age originate a style of its own, than strive so obstinately to reproduce the past, we cannot help admiring many of the designs, especially a Gothic chimney-piece, by G Myers, of unusual elegance and spirit.

Turning to the Colonial Courts that we naturally expect the greatest triumph of British industry, and the Briton is so proverbially fond of his fireside, that it is no wonder if fire-places pre-eminently shine amongst the productions of his industry. The Coalbrooke Iron Company exhibit a splendid combination of steel, marble, and electro-gilt iron. They also show some railings of very beautiful pattern.

Messrs. Winfield have some tasteful little tables of marble and gilt metal, which for strength and beauty are gems in their way. They have also two bedsteads, of brass and iron, of very pretty make, with a view for tightening the iron sacking. This, however, is the chief screw in their composition, as they are made to dovetail together entirely. Now, of all the principles in the construction of furniture, dovetailing, *versus* glue, nails, and screws, ought to be upheld and insisted on. Ships' chairs and tables ought to fit together and take to pieces like a child's puzzle. This is the system of strength, neatness, and economy. Each piece is, as it were, cast in a mould, and can be multiplied *ad libitum*, like the copies of a newspaper. So, dovetailing for ever! with the slow pace, the saw, the screw-driver, and the hammer! A brass camp bedstead, by the same exhibitors, with four posts, a tent head, 3 feet wide by 7 feet long, and with three sets of legs, folds up, and may be put into a box about a yard long and one foot in breadth and depth. A mosaic-wood, with brass pedestal, and the invention of tapering spiral brass columns for bedsteads, also do credit to these exhibitors.

Some gilt railings for a staircase or balcony, by Messenger, are very massive and handsome. Also, a gigantic or molu bracket, to sustain a statue or candelabra in a public hall

As for stoves, there are so many, by different exhibitors, all so magnificent in gilding, polished steel, and other devices, that we can only confess our inability to select specimens, without appearing partial, from such a collection. In this line, Messrs Feetham and Co., Pierce; Hooke, Robson, and Co, and Burton distinguish themselves. The latter's nauthus stove is very elegant.

Messrs. Jennens and Bettridge deserve commendation for their invention of what may be called the poetry of furniture. Their day dreamer's chair, with its *papier maché* paintings, or molu, and velvet, is indeed an embodiment of luxurious reverie; and the "melancholy, mild-eyed lotus-eaters" would certainly have sent such a chair to the Exhibition, if lotus-eaters would *ex*-pend so low a key to manufacture anything, or trouble themselves about anything but the r own dreamy visions

We now glance at Jordan's machine for wood carving, which places that mode of decoration within the reach of the many, and plunge forthwith into the regions of actual mahogany. Here Gillon and Co. have a splendid sideboard, supported by spread-eagles, as if it contemplated at some future period flying away with somebody's plate and a substantive and adjective dinner. Imposing solidity, that no amount of earthly dowagers, after the lapse of any amount of years, could possibly break it down. Hence we conclude that this sofa will either last for ever or be destroyed by fire. Attaching itself might take the next opportunity without crushing it. The same exhibitors have other most elaborately carved sideboards, but we are constrained to admit that massiveness appears their most striking virtue.

A sideboard, by Levien, in dark New Zealand wood, with light *bas reliefs*, is very handsome, and carved with great delicacy. Had it, however, been the work of New Zealand artists, it would have more deeply interested us. Surely such adepts at tattooing are well qualified to shine in the elaborate carving of furniture. Indeed, the paddles and canoes of the savages afford ample proof of their capacity for this kind of labour.

Some Gothic chairs and a glass screen in a fine Gothic frames, by Wethcrell, are very pleasing. But we restrain ourselves from further descanting on the admirable specimens of furniture exhibited. Perhaps, for elegance of design, Hirsch's tables of gold, covered with green velvet and supported by swans of white enamel, deserve the palm. We now hasten to seek here and there the germs of inventive talent in the employment or improvement of the various materials over which man exercises his industrial empire.

Some perforated muslin blinds, by Harris, are remarkable for their ingenuity, simplicity, and taste. H. Bingley's slate enamel, exquisitely adorned by Etruscan designs, from the old vases, in red and black, is very beautiful and rich in effect, resembling exactly inlaid marble Few things pleased us more in the Fine Arts department than these enamelings The two mosaic table slabs, by Charles Carrick, a schoolmaster, during intervals of labour, with no other tools than two or three Table-knives made into saws, and a hammer, are truly wonderful in their way. The fantastic elaboration of the different coloured woods, circle within circle, and no two alike, has a marvellous effect upon the spectator. They are mystic dreamings, those strange interlacing figures, and the work of no common intellect. Mr. Carrick is indeed a born artist, and ought, perhaps, to have been a painter. However, after all, there are painters enough in the world, but we know not another mosaic worker such as Mr. Carrick.

In the Eastern Avenue, north side, is an invention by a French manufacturer, M. Zoller, of Lyons, which cannot fail to contribute largely to the pleasures and comforts of the community. This is a piano, so constructed that it can be played like a grinding organ, by applying to a certain set of wires certain oblong pieces of wood, covered over with little pegs or nails. Now, into these pieces of wood, of which several boxes stand at the side of the instrument, are nailed a variety of tunes and quadrilles, polkas, &c.; and any new piece of music may be had to order duly pegged out in these wonderful little boards. Thus music will be no longer confined to those versed in the art; nor will any unfortunate young lady be victimised, in future days, when these pianos have superseded the old sort, by unmerciful requests to "go on," or play "just one more waltz," for dancers without any in their souls, but apparently with springs of perpetual motion in their toes, since every lazy young gentleman, who lounges against a door-post, will be qualified and called on to take his turn at the grinder; unless, indeed, the footboy be at liberty to perform that revolutionary operation, which he could accomplish as well as anybody, though we question whether many mortal footboys, or footmen either, could at the present epoch of civilisation in any other way "oblige their master with a polka," or their mistress "with a quadrille."

Amongst the models of houses themselves, we cannot say that much originality is shewn, nor indeed is inventive novelty by any means the leading characteristic of the Great Exhibition. Perhaps inventors are more shy of exhibiting their wares than other people. Perhaps after the mighty discoveries and contrivances of late years, there may be a lull in that department of anthropological activity. Notwithstanding all the beautiful French paper-hangings and carpets from France, Turkey, and Kidderminster; notwithstanding all the richly-carved furniture from Austria, France, Belgium, and so many strange lands; notwithstanding all the varied wonders of the place, we still return to the first reflection, that, for the improvement of human dwellings, light, air, and space are the great requisites, and we look in vain for any such Building in which so many instruments of domestic comfort and luxury are assembled, with the thought that that network of iron, and those sheets of crystal, contain something beyond the wares they shelter, hereafter to become a "great fact" throughout the land.

MICROSCOPICAL PREPARATIONS.

THE use of the microscope has, within the last few years, completely revolutionised the study of physiology in this country, and microscopic objects naturally demand full consideration. In this particular Mr. Hett has deservedly acquired a high reputation, and we hear very excellent plan for showing a number of injected specimens under a microscope, and we can promise our readers ample pleasure from spending half an hour with his microscope, which is fixed at the North-west Gallery, near Willis's great organ. Whilst listening to the notes of this fine instrument, the visitors may also gratify themselves by examining these beautiful specimens; and they may there see how the blood comes in contact with the atmosphere in the lungs, and becomes arterialised. At the College of Surgeons of London we have the finest anatomical and physiological museum in the world; and the Exhibition, by bringing forth Mr. Hett's instrument, has shown how Mr. Quekett's preparations may be rendered available to the student at any time. In microscopic injections Mr. Hett takes the first place, both in the English and French departments. With more than usual investigation he has acquired a fine reputation. He exhibits nine frames containing the test objects which are suitable for the best microscopes, together with fossil earths and fossil and recent vegetable structures. He has also shown some beautiful specimens of dissections and injected specimens of bone, teeth, and shell, and seven sections of Oriental and Scotch pearls. Besides these, he also exhibits anatomical injections, including a remarkably fine example from the intestine of the rhinoceros. All these specimens are entitled to the highest commendation.

Within the last two or three years a second mounter of microscopic preparations has appeared in the person of Mr. Poulton, of Reading With microscopists he has become a great favourite, for his civility and the attention which he pays to their wishes, and he has exhibited a series of first-class objects which he has prepared. We particularly call the attention of our French neighbours to these objects, as they will see the perfection which naturalists and investigators expect from the mounters of microscopic objects in England.

The ordinary mode of injecting the capillary vessels is either by size and vermilion, or by the chromate of lead. In examining the objects, we detected, however, unlabelled, one specimen of a carmine injection, which was manifestly a section of brain. Mr. Sinse has exhibited at various sources, as well as at the Microscopical Club, a series of specimens of this character. In a former Number of this Journal we figured the bloodvessels of the cerebellum of the brain, which is an object exceedingly difficult to prepare; but it is supposed the full process of injecting with carmine has never been published, as it is said to have failed in the hands of other investigators.

Mr. Stark, of Edinburgh, exhibits a process of mounting objects in gutta percha cells, but we have not yet been able to try it. Messrs. Smith and Beck exhibit a model cabinet, well adapted for containing the objects; but we are afraid it is almost too aristocratic for the working philosopher, to whom expense is an object; and, lastly, Mr. Leonard exhibits drawings of microscopical objects.

The microscopic specimens which are here exhibited may be taken as a fair example of the minute knowledge which is now possessed by every well-educated medical man at the present time. Scarce fifteen years ago, no Englishman was conversant with the gaudeous structure which the microscope now reveals in a few dry cells. Since that period the mode of arrangement of the ultimate blood-vessels of every part of the body has been determined. The geologists now delight in the examination of fossil infusoria, or in sections of the teeth of the gigantic fossil fishes, and we look for the elucidation of many curious [illegible] peculiar development of the characters of the substances which [illegible] The microscopist examines the gems by the form of the cells which cover the butterfly's wings, and no investigator, in any branch of science, can afford to be without the possession of a microscope to assist his powers of vision. The microscope is, to minute objects, what the telescope is to the starry firmament, and both must exemplify how limited are the powers of man to grapple with either the immense or infinite extension of nature's works.

EASTON'S HYDRAULIC RAM

Messrs. Easton and Amos, the well-known engineers, exhibit, in immediate approximate to the grand hydraulic pressure in the Hydraulic Court, a good walk which they had a great deal to do, "Easton, Amos, and Sons' Hydraulic Ram," which is of very simple construction, being composed chiefly of an air-vessel and three valves, two of which are for the water, and one for keeping up the supply of air. Upon the valve situated in the conducting tube being pressed down, the water escapes from it until its momentum is sufficient to overcome the weight, when the valve immediately rises, and closes the aperture. The water, having no other way of escaping, is forced through the inner valve, and compresses the air in the air-vessel until the latter is in equilibrium with it, when it re-acts by its expansive force, closing the inner valve, which retains the water above it, and draws it up the ascending tube. By this reaction the water is forced back along the conducting-pipe, producing a partial vacuum beneath the outlet-valve, which immediately falls by its own weight. The water then escapes until it has acquired sufficient force again to close it, when the action is repeated as before.

TEXTILE FABRICS.

In our review of the Halifax contributions, those of Messrs. John Houldsworth and Co., of that town, were inadvertently omitted. These consist of damask table-covers and furniture damasks, together with printed furnitures or linsettings. The latter are by far the most tasteful productions, the colours being brilliant, and the general effect rich and agreeable. The printing, however, from the style, appears to be the work of Messrs Swainson and Dennis, the fabric being manufactured by the exhibitors. Some of the table-covers are bold and effective in design, but the damask furnitures might be more refined in taste As a whole, however, the display is a creditable one.

By a misprint in the notice of the specimens of cotton manufactures exhibited by Messrs. Mycrscough and Steel, of Bolton, the quantities are stated to be of good "water," instead of "good quality," as intended.

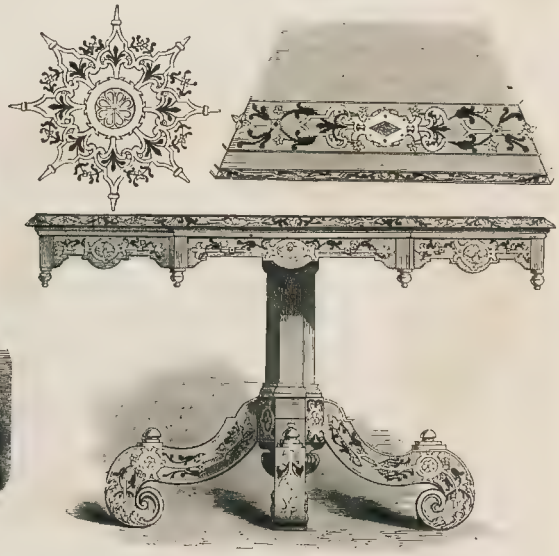
TRANSPARENT PAINTED BLIND.—BACH.

GILDED PIER TABLE AND GLASS.—MESSRS. HOLLAND AND SON.

PIER TABLE AND GLASS. BY HOLLAND AND SONS.

This piece of furniture is very ambitious in style, and profusely embellished with various devices; but the effect is far from being as satisfactory as so much outlay of time, labour, and materials might lead one to expect. *Polonius'* admonition, "neat, not gaudy," has been disregarded in its construction. The subjects of decoration are endless in variety, and stick about in all directions, being at once liable to accidental injury, and difficult to clean; and their bewildering effect is increased by the introduction upon them of various colours in gold, silver, copper, &c. The principal conceits in the recess beneath the slab are three little copper-faced boys playing upon various instruments of music in silver and brass, and lying *perdu* amongst aquatic foliage of various kinds, including bullrushes. The same character of decoration is carried round the frame of the glass. In fine we must look upon this wonderful structure more as a specimen of what may be done, than what it would be desirable to do; and in that light it has certainly considerable claims upon the attention of the visitor.

FURNITURE. EAST INDIA COMPANY.

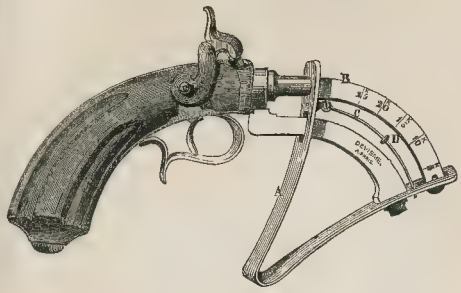


INLAID TABLE AND ORNAMENTS OF TOP.—CALDECOTT, GREAT RUSSELL STREET.

FRENCH ORNAMENTED FIRE-ARMS.

The French gunmakers pay great attention to the decoration of small arms, as fancy pistols and so forth, which they really render very beautiful, almost inviting in appearance. MM. Mortier Lepage, Devisme, Claudin, Lefaucheux, and others who have especially distinguished themselves in this branch of ornamental manufacture, make each a very handsome display in the present Exhibition, their locality being on the north side of the Foreign Nave. In the present page we give several specimens. The pocket-pistol by Devisme is very elaborately ornamented with damascene work and incrustation in gold. The five-barrelled pistol, by Lefaucheux, is more moderately ornamented. The pistol and appendages by Claudin are very richly chased and engraved in a mixed style; the barrel of the pistol being Gothic, and the lock and hammer combining, with the Gothic, decorations of the Louis Quatorze style. The powder-flask is especially beautiful, both as to design and workmanship. The gun constructed for loading at the breech, by Lefaucheux, exhibits very neat workmanship. Claudin and others also have specimens of guns upon the same principle.

POCKET-PISTOL, WITH DAMASCENE WORK AND INCRUSTATION IN GOLD.—DENISME.



PROVING PISTOL, N DEVISME'S PLAN, FOR TRYING THE FORCE OF POWDER.

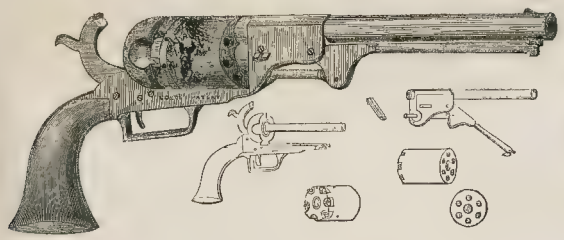
DEVISME'S PROVING PISTOL.

Devisme's proving pistol, for trying the strength of gunpowder, is constructed upon a very simple principle, and is said to answer the purpose with extreme accuracy. The charge is inserted in a small tube or barrel drilled in the stock, and which it fills. Against this the flat surface of a steel spring presses; and, upon the charge being fired, the extent of the divergence of the latter along the graduated scale indicates the degree of strength of the powder proved.

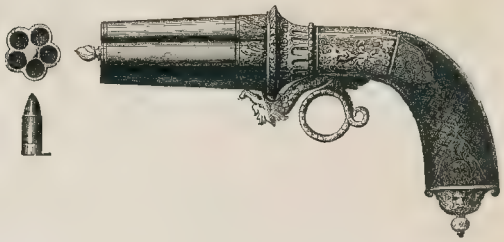
COLT'S REVOLVER.

In this page we also give a diagram of the revolver, or repeating pistol, invented by Samuel Colt, of the United States, and which is so terribly efficient in its operations as to leave all former inventions of the kind far in the background. The report of the Board of Ordnance, U.S., is strongly in favour of its adoption in the army, particularly in frontier warfare, where it has already proved of most important service.

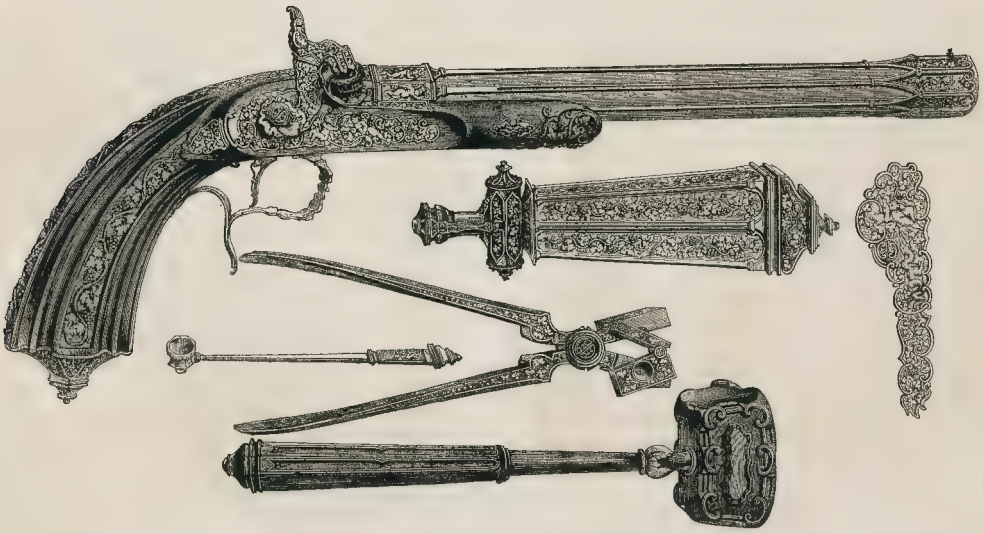
GUN TO BE LOADED AT THE BREECH, ON LEFAUCHEUX'S PLAN.



COLT'S REVOLVER.



FIVE-BARRELLED PISTOL.—LEFAUCHEUX.



PISTOL AND APPENDAGES.—CLAUDIN.

FOOD OF MAN.—No. II.

VEGETAL SUBSTANCES.—ROOTS, GRAIN, PULSES, &c.

WE mentioned in our last Number, that even in this city a number of persons are to be found who believe that the fruits and farinaceæ are alone destined for human food. From our experience, the relative number to the whole population is exceedingly small; and in many cases where that line of diet is followed, we have found that the individual has been affected with disease of the heart, and no doubt used vegetable food because he found it preferable to abstain from more stimulating viands.

We give the following as a specimen of the diet of a vegetarian:—He was an abstainer from all alcoholic drinks. For breakfast he had porridge, with bread and butter and potatoes; for lunch, bread and dried fruit; for dinner, potatoes, pears, apples, puddings, and fruits, with such other vegetables as were in season. He stated that he was capable of endurance, and to himself he had appeared to gain in strength; but he was decidedly irritable in temperament, which he found had increased since this line of diet had been pursued. Many vegetarians use a large quantity of eggs, but by that course they sacrifice their whole principle.

Of all vegetable products, the root of the potato is the only one suitable by itself for the maintenance of life. It contains starch for the purpose of making fat and keeping up the heat of the body; gluten, which is a nitrogenised substance, and capable of affording muscular strength; iron, for the blood; phosphorus, for the brain; citric acid, to prevent scurvy. The fault which is found with it as an aliment is the low amount of the gluten; and hence, practically, the Irish remedy the defect by the use of skim-milk, which contains abundance of that material At the Crystal Palace we have dried slices of potatoes; we have potatoes preserved in tin; we have models of the principal varieties grown in Scotland, and we have what is called potato-flour. This latter, we believe, is merely the starchy matter, and therefore has not the nutritive properties of the entire potato. The potato tubers must not be confounded with the sweet potato, a model of which is to be seen at Messrs. Lawson's. This latter plant is a totally different kind of plant; and from trials which we have made under the most favourable circumstances, will not form tubers in England. It is very analogous to the root of the yam, so much used in the West Indies. Both, when baked, give a white floury produce, which we find, when mixed with a certain portion of flour, can be made into a good bread. The Irishman will eat from 6 lb. to 12 lb. of potatoes during a single day.

Of all vegetable products, wheat is regarded as the most important. It contains, in a very concentrated form, the materials which are necessary for the human organisation. It has been cultivated for so long a period, that we know not the wild plant whence it is proceeded, and yet, nevertheless, it requires much preparation to render it fit for food. The grain itself consists principally of three parts—the lignine or woody case, which gives it its general form, and which is separated in the form of bran and pollard; the starch, and vegetable gluten, which exist in the flour and give to it its nutritive properties. It moreover contains phosphorus in a state peculiarly adapted for assimilation. Our first millers consider that the flour, when too highly sifted, is not so nutritive as that which is rather coarser, because, by continually sifting it, little more than starch granules are ultimately left. A large manufacturer of this metropolis required a peculiar operation, involving great labour, to be performed by one man. He tried successively the powerful-looking Irish, the tall north country and west country men, but all were obliged to abandon it except those whom he procured from eastern counties, and had had the advantage of full diet and good wheaten bread—a fact which well shows the necessity of feeding the people.

Of wheat itself, we have specimens from all parts of the world. Our own country has shown most excellent examples. Canada also contributes its portion. From Russia the finest samples are obtained. America is great in this matter. Egypt, which has grain from the time of the Pharaohs, enters into competition by producing its examples. Portugal, Spain, and, in fact, nearly every important land sent some specimens to the Crystal Palace. Specimens of wheat in the ear are to be seen at Mr. Lawson's stall, or at the stalls of Mr Gibbs where they are carefully arranged in the very worst possible manner for the visitor to inspect them.

Barley is an article of food, is next in importance to wheat. Some are sent from the Royal Farm; and, in fact, abundance of specimens are furnished from most parts of the world. Oats contain more nitrogenised matter than barley, and less than wheat; and thus, next to wheat, it is the most important grain which is grown. Oat cakes are exhibited by Messrs. Lawson, and Mr. Smith has exhibited oaten flour prepared by a patent process.

Chemists find that barley is greatly inferior to oats. It contains more starchy matter and less nitrogenized compound. Hence it is well adapted for fattening poultry. At the Exhibition it is represented as well as oats and wheat, in many departments. Barley bread is contributed by Messrs. Lawson and Co.

Indian corn is exhibited in the American department, of the first excellence. This vegetable substance came to our aid during the famine in Ireland, but as an ordinary article of food it is greatly inferior to wheat. It contains less gluten than wheat, and is not therefore so sustaining. Indian corn has not proved a profitable crop in England, and though several kinds may be grown and will yield a small crop, it does not appear to be profitable to the farmer. Mr. Keene has shown his forty-day maize from the Pyrenees, which is the best adapted variety for the English climate. The small maize from Lower Egypt is very curious and well deserves examination.

According to those who estimate the value of food solely by the quantity of nitrogen it contains, the leguminous seeds would appear to hold the first place, for peas, beans, and lentils abound in nitrogenised products. In practice, the surgeon is aware that none of them are to be compared with the other vegetable substances which yield gluten, and there appears to be a great difficulty in their perfect digestion. The French show many packets of preserved green peas, in canisters; and upon the whole subject, whilst admitting the excellence of green peas in young broad beans, and fully extolling the French and scarlet beans as employed as a vegetable, and having no objection to pea-soup on a cold winter's day, yet, as an ordinary article of nutrition, we have a very low opinion of leguminous matter, and do not, even from our experience, consider that they can be safely employed to any extent. They contain little or no phosphorus, which places them in powerful contrast with the potato in this respect. Turkey sends a great many lentils, and from the Royal Farm of Windsor a tub of beans is sent. Pea biscuits and bean biscuits are shown by Messrs. Lawson. French beans and scarlet beans in the green pod are shown, preserved in vinegar.

Rice is shown from almost every country in which it thrives. We have had the curiosity to prepare it in this country; but even there it ill suits our short summers. Five varieties are shown by one exhibitor under the Spanish department. It is a vegetable product which, from its simplicity and pleasant flavour, it is almost impossible to get tired of. It may be cooked in many different ways, and in all it is remarkable for its digestibility. Indeed, we consider it to be the quickest, or one of the quickest, digestible substances which has been ever discovered for food. Some years ago there was a great prejudice against its employment by the poor, and even now it is not very much used as it ought to be. It contains more starch and less gluten than wheat and some other grains, and hence, by itself, would be but a poor food, as it would hardly supply sufficient for muscular energy. We have observed that people are really themselves most excellent judges of the effective powers which they obtain from various foods, and perhaps they have not found it go so far, for its price, as potatoes or good wheaten bread. The rice exhibited in almost all the departments has the husk, and, perhaps, many of our country visitors have not before seen it in that state. In the Indian department paddy is very well represented.

Mr. M'Callum has sent specimens of the creeping stem of the *Typha latifolia*, or large red mace, which is said to yield a meal fit for food, and supplies a fibre which can be adapted for various manufacturing purposes. We really know nothing about it, and therefore do not recommend it till we hear further of its properties. Of various roots used for food, we have the parsnip represented by a model. It forms a nutritious substance, and can be mixed with bread. The carrot in far less digestible than the parsnip, and may be found in some of the preserved cylinders of provisions. Turnips, so far as we know, are simply shown by a model. They form a nutritious food if taken in sufficient quantity, but will not answer for the poor at London prices. They may be made, with a certain proportion of wheat flour, into bread. Jerusalem artichokes are not much used, and then are employed more as a luxury on the table of the rich. They are also represented by a model. Amongst the roots, Messrs. Lawson have shown the *Apios tuberosa*, proposed as a substitute for the potato; but it appears, even if wholesome, which is doubtful, that it yields but very small produce. Mr. Lawson has also shown models of the *Orobus tuberosus* and the *Oxalis crenata*, but we fancy neither of them are much used. Radishes are represented in many varieties by models. Asparagus is shown in vinegar. And amongst the stems, the native principle, the active principle, may be seen in high perfection; and sea-kale is illustrated by models

Of the cabbage tribe, we have broccoli and cabbages in pickles, and also preserved in vinegar.

Of the whole cucumber tribe, melons, candied, are furnished. Preserved cucumbers are shown; but we do not see either gourds, pumpkins, or vegetable marrows, though they may possibly have escaped our notice.

Salep, the root of an orchid, dried, is shown by several specimens in the Persian and Indian department. It is said to form a considerable portion of the diet of the inhabitants of Turkey, Syria, and Persia. The *Orchis mascula* grows in England; and only a few days ago we walked through a field literally covered with them.

The coffee berry is shown from various parts of the world. It is the produce of a handsome shrub, which may be seen at Kew, or, in fact, at many of the nursery-grounds. It is roasted and ground before it is used for food. On the 1st of May one of the Turkish superintendents was explaining to a number of ladies the use of a set of coffee utensils used by them. He told them "that they must excuse him, but the English ladies did not know how to make good coffee. His countrymen used boiling water, and threw the coffee into it, and when it had twice risen it was ready for use." Upon interrogation he appeared to set little store upon its clearness, so we are afraid that his excellent coffee would not meet with much favour at a West-End dinner party. The powder of coffee over the brain and nervous system are sufficiently well marked; and perhaps the public should know that in the strongest coffee they have a powerful agent at hand to resuscitate persons who are suffering from immoderate drinking or too free use of opium. In the North-west Gallery the public may observe several fine specimens of theine and caffeine, and one which deserves investigation. It is stated by Dr. Gardner to be made from the roasted specimens of which are displayed. We took two or three leaves from our coffee plant and roasted them, and tasted the infusion. In our judgment the experiment did not appear to be promising, yet we should be sorry to dismiss the question of their utility in so summary a manner, and should delight if Dr. Gardner could prove that the leaves will add to the comforts of the poor. Connected with coffee, we may state that Mr. Snowden has shown samples of cleansing and purifying the coffee berry previous to roasting and grinding.

Messrs. Saunders and Cahill have shown chicory in all its stages. This detestable stuff is principally used by dishonest traders for the purpose of making the public believe that they sell cheaper than their neighbours. It is the dried root of the wild endive which is employed, and is now much grown in England, France, Germany, &c. There is an import duty upon the foreign produce, whilst that grown in England is not subject to the excise laws. For this reason the vendor gets the whole benefit of the impost; and as the farmers are always screwed to the payment of the highest rent which they can bear, the landlord gets the ultimate benefit of its sale. The use of this nasty adulterative is so extensive, that chicory itself is now enormously adulterated by various other roasted substances, and, whilst landowners are benefited thereby, there is no immediate prospect of any abatement of the nuisance, unless, indeed, the publication of the name of the dishonest trader by the *Lancet* shall induce the public to leave the shops of all those who thus cheat their customers

It is a curious fact that both tea and coffee owe their properties to the presence of the same alkaloid, as *theine* and *caffeine* are identical in composition, and are highly nitrogenised products. The delight which English people take in tea and coffee renders both important articles of commerce, and both are well represented. In the Chinese department our readers will have an interesting display of samples of the different processes employed in the manufacture of tea, from the planting of the seed to the packing of the chests, and a very extensive series of genuine and factitious teas are exhibited of every class. The green tea and black tea are different plants, according to Dr. Lindley's, Kew Gardens, botanists, and even in other nursery-grounds. Perhaps we might suggest that some who have plants to spare would send an example of each to place beside the prepared teas, as it would add much to their interest. The Assam Tea Company have also a very interesting display of the tea plant and its uses in India, and which have at any rate a very excellent appearance. The exact operation of tea on the system is not known, but it is manifest it exercises considerable influence over the functions of the nervous system. Some persons cannot take it at all night after a good dinner or tea, and there can be no question that it supports, in other instances, the action of the brain, and takes off the sense of fatigue. On the shilling days numbers may be seen, after the fatigues of the day, revivifying their powers by a cup of tea. We consider that this beverage destroys the tone of the stomach, and predisposes to cramps.

Chocolate is a vegetable food not nearly as much used in England as in our neighbouring countries. It is prepared from the nut of the chocolate tree, which may be seen at Kew-gardens in high perfection. Messrs. Fry and Sons exhibit a large collection of the leaves, flowers, and branches of the tree which yields the nuts. The nut consists of a large quantity of oily matter, and a nitrogenised principle very similar to theine. Amongst the machines in motion, a model of an apparatus for grinding and preparing it is shown, and those who walk down Holborn may see the real apparatus in action. The French and most foreigners make numerous bon-bons of this material

The Paris company has sent many specimens of chocolate, mixed with various materials. Some are flavoured with vanilla, the seed-pod of a species of orchid, which was shown last week at the Botanic Gardens in the fresh state, and is also exhibited in the Crystal Palace, in the department for the colonies, and also in several chocolate cases, in the dried state.

We suppose that we must class the tobacco amongst articles of food. It is procured, as all our readers know, from a plant which grows freely in our gardens, but which does not here yield so potential a product Perhaps, however, the cultivation of the leaves would be little worse than poisonous is the substance with which they are dealing, as a very small quantity will destroy life if taken into the stomach; and it is so powerful and uncertain a remedy, that but very few medical men dare to employ it. It is used, nevertheless, in three ways—either as a mixture to be chewed, a powder to be snuffed up the nose, or the vapour which is inhaled during burning is allowed to come in contact with the mucous membrane of the mouth and fauces. The use of it is said to destroy the sense of hunger under intense fatigue, and to serve as a stimulus to the nervous system; but, physiologically, we must hold that its employment ought for every purpose be abandoned. For this reason we feel very little inclined to record the numerous examples which are shown. Mr. Taylor has shown tobacco and snuff of English manufacture; and both in the British and foreign departments there is a splendid assortment. Those who delight in the pipe, may find it of every shape and form; the exhibitors of the Zollverein contributing very large quantities, occupying the space of more useful works of industry.

If tobacco be classed as a food, opium has as much right to our attention. We may have drunkards, we may have tobacco-smokers in abundance, but, fortunately, our land is not extensively degraded by any very great employment of this pernicious drug. Nevertheless, we have seen the opium-eater, and that which is recorded of the Chinese is equally to be noticed of the European who gives way to the truly horrible habit of opium-eating. At first, the greater part of the time of the unhappy victim was spent in a dreamy sleepiness, when the party appeared half unconscious to all surrounding objects, and was revelling in the visions which appeared before his mind. By degrees, he spent more and more time in this state, till but a very slight interval of consciousness was daily allowed to him. At a later period, the entire muscular system wasted away, till he could be described as a mere animated skeleton, he fell a prey to the detestable vice; and we trust that we may be spared from ever witnessing another such example as that which we now record.

From the above account, our readers cannot fail to observe that the number of vegetal substances used for food have been abundantly represented; and yet, besides these, we shall hereafter have to describe numerous fruits and vegetable products which have also been contributed. The whole question of food is very largely represented, and it is much to be desired, that, when so many specimens have been collected from so many countries, at such great labour and cost, they should never be again dispersed, but that they should serve either as a nucleus for a museum, or that they may be added to that highly important and valuable collection which Sir William Hooker has already collected together in the national gardens of Kew.

LETTERS FROM LONDON
ON
THE GREAT EXHIBITION AND OTHER MATTERS.

BY PELEG E. WHEELER,

WITH AN INTRODUCTION BY BAYLE BERNARD.

(*Continued from page 605.*)

LETTER V.—TO DEACON BIGELOW, AGAR-HOUSE, COOK'S FERRY.

LONDON—THE MAMMOTH CITY—THE GREAT HUMAN EXHIBITION—THE MAJOR'S LODGING AND COMPANIONS—HIS SEARCH FOR THE CONSPIRACY—AND FIRST VIEW OF THE WORLD'S WAREHOUSE.

RESPECTED FRIEND,—

The Mammoth city! That's its title—that's its size, and nothin' under. I've got into it, that's sartin'; there's as little doubt of that, as that a shot is at the bottom if it's drop'd into the sea. But the question I'm likely asking it, Am I likely to get out again? I've been here almost two days, and if I can find my way about, I wish I may be skinn'd. If I aint lost before to-morrow and cried for, it's a pity. I vow if I aint working as hard as a fly agin a winder-pane, or a field-mouse in a washing-tub, and for about as big a profit. If I aint as bother'd as a bullock that's going over a cattyract, that gits whirl'd and whirl'd about head and tail alternately, till he's regular dumbfoozled—till his senses leave him first, and then—whish—and he goes arter 'em. For what's a man to do in a hundred miles of houses, which are as like as our mollasy, and along streets, that are as crooked and full of crosses as a sixtanse? Do you remember the old story of getting along in the Genesee; how the soil lay so light there, you could travel under ground. Here I reckon it's tother way—you ought to travel over head; git along in a balloon that's just a shave above the chimneys, with a rope ladder hanging ready to drop you down when wanted: that's the plan to steer New London, and to see it or I'm mistaken. You mustn't go into it; you must git out on it, if you want to take its measurement. If you want to know a wilderness, you allers mount a hill; and I reckon London is suthin' like one, and as full of hungry critters.

So it's no use my describing it. If my pen was double-action'd, and your brains were India-rubber, and could stretch to any width, Deacon, I wouldn't vantage you a cent. Put on all the steam I could, I couldn't give you half a notion on't. Couldn't paint its pictur, if I had a whole county for my canvas. What's the use of my telling you that London's as big as our bay, or all Rhode Island under kiver; that it aint so much one city as half a hundred glued together; a sorter congress capital, where there's about forty represented. The bones don't make the body—the carcass aint the soul; I've still got to show its natur, and how the dogs shall I do that, even sposing I was an orator, and had got the diklahunry in stock, and could deal like Dannel Webster in all the best six syllables! What's the use of my saying that it's a most partiklar good quilt, made up of a thousand patterns, and scarcely two alike in textur, shape, or colour; that it's got docks and ships at one send, and palaces at tother; parks and gardens upon one side, and human pig-styes right agin 'em; that its river is like its streets—jist as dirty and as crowded; that its churches are a sight, and its bridges beat all natur; that it's got no end of railroads, and carryges, and steamers; and is full of playhouses, and breweries, and shops, and lords and sogers? Or s'pose I sent a map on it, all the maps I've seen are blankets, they don't give its look full-length! Or tell you to get a rule and compasses, and scale it on your pudding-board, or behind your parlor door: that's no sarvis nuther; you couldn't get its figger, tho' your compasses were to strain themselves. There's only this thing to be said, Deacon—it's a Mammoth! that's a fact.

Yes, a wonder as it is, Deacon, it reckon it aint the biggest. There's another one inside on it, that whips it out of countin'. You can't credit that, I daressay, but it's as sartin as the Bank. That wonder is the people! Yes, Deacon, it's the people—the onconceivable and everlastin' tide of livin human beings—that swells, and rolls, and pants, and rushes from one side to another, like the Falls at the Exhibition, Deacon—of man's products in the Park! I reckon here's a grander one; here's man himself to look at. Here's a human exhibition, such as airth has never witnessed—contributions of humanity from all quarters of the globe, which its great Maker would unite under one roof, and say, "Here, you critters, go!" I couldn't describe the body, what am I to say about the life in it? If I had no power to draw the features, how the plague shall I get the sperit? How am I to make out to you the crowd of heads, and legs, and riggings, that give such a sample of industrial energy in gitting along the streets? Turks and Frenchmen with red caps and blue tossels; jailer-tail tassels, and blue, jailor-looking coats, that grip 'em tight up by the throat, for all the world like their own governments; (not the easy fit of our'n. Deacon, that gives the limbs full play), and Chinamen as natral as if they'd walk'd out of a jar; and Afrykins as happy as are the Englishmen when the sun shines, and they've got a treat of Fleet-street beef, where 'tant colour makes the man. And Frenchmen, on tother hand, who *are* ashamed of there'n, and kiver 'em up with whiskers 'till you see their eyes peep over 'em, like a feller's in a bear-skin who's sleighing in the snow. And to see this great stream a flowing, Deacon, coming down one of the big channels of the Park, past the Fleet-street Temple Bar, or the Strand—jist as though the Niagara had got upon a slant, and was boiling along in rapids, instead of pitching down a precipice. And then, conceive a feller trying his best to head it, putting his bows up dead agin it, like a Mississippi steamer; and if he can stem the tide at all, perhaps burstling up at last upon some of the plagey snags and sawyers that he'll catch at every corner. It's the people is the wonder, Deacon. This grand reservoir of man, here collecting and interfusing, not to stagnate and breed miasmy, as in other public gatherings—as, for instance, we'll just say in the dead sea of a camp—but a source of health and vigour, that will flow forth in two months' time to carry strength and freshness with it, and make the whole world a garden, that has so long been kept a desart. It's the people is the wonder, Deacon—it's the people, that's a fact!

But, I s'pose, you'd like to know where they all stow themselves at night—after flowing about all day, how they eddy into bed? Well, as I larnt it in my younger days, when I was perambulating a peter-shop lying, I was told, 'twixt the two great sends of London, and jist an easy distance from the World's Warehouse in the Park. But I guess 'twas more than that; I heard 'twas going to have a show that would almost whip the Exhibition—falling short of a great globe, as big as the top of Boston State House, which is to serve as another means of bringing all the world together; a globe so big and so exact, that a Russian or Mexican could find out his native place on it, and a feller from Wisconsin could clap his hand on his own clearing. So, making sure, of course, I should find Penobscot in full blaze, I saw the good on it at once, if half a million of visitors should go home by North Ameriky. So, says I, I see my port, I take my ticket for that station; and I got there safe enough. But how about my stopping? Well, I reckon that warn't so sartin: I found that so many fellers had all come on the same errand, in my opinion, that every house about the spot was already chock full to the roof; that there warn't one but had folks in layers, lying one above another, in a sorter strater fashion, and packed by hard compression. So, what was I to do, Deacon? When I asked for a hull room, I vow if they didn't stare at me as if I'd come from a museum. "What I a hull room to yourself!" says they. "Yes," says I, "myself, as I've left my wife at home." "Then you want the room of four," says they. "We don't let rooms, but corners, and we arn't got one to spare." And it warn't a great deal better when I asked for a sing.e bed; I found that they were halved and quartered, and that fellers lay long and crosswise in them, like the timbers of a log hut. And I was sure than that in some on 'em; chairs and sofys were all gone, and the only accommodation was the top of a kitchen dresser, or a hearth-rug on the stairs. So I begun to git rather skeary. I vow if I didn't think I should have to camp out arter all, and git a lodging on a door-step or the soft side of a plank; when, arter knocking about till midnight, tacking here and there, and trying every channel, at last I sighted land. I found a house with a hull bed in it, and didn't stop to talk of terms, but run up to it full clip, to make sure on it at once. And when I had stretch'd out I found myself in a high latitood, jamm'd up agin the roof, and spread out on the same floor with four other furrin visitors—three Frenchmen and a German.

Well, I don't dislike the floor, Deacon, when the weather's gitting hot: first, because it prevents axydents. A man may git excited with either juleps or his country, and tumble out occasionally, as I've seen a feller do at home, from one of our old four-posters, when I vow if it didn't seem as if he was coming down a waterfall; and next, because this sleeping on a level with your others was, arter all, concormable to our great principle of equality. If men are to stand on the same footin', I don't see why they aint to sleep—why the principle aint as applicable to their backs as to their legs. And equality warn't all the fact; I guess it caused fraternity, as you'll see from what ensood. As soon as I was under hatches, I thought I'd see my company—see who were the folks I'd got amongst; and as the candle warn't put out, I was able to manage that by lookin' at one on 'em pretty straight, and at t'others sorter sideways, working my optics suthin' swivel fashion, like the bow-guns of a pirate. Well, I vow if I didn't think they were a lot of bears who had gone to hospital. What with their holler yaller jaws, and their everlastin' hides of hair, it warn't in natur' to expect speech from 'em, but jist a snuffle and a grunt; and I can't say that in the first instance I felt altogether easy—they stared so eternal hard at me, and kept their jaws jammed up so fast. So, as a last, they say, the costs nothin' and often keeps two coats from foulin', I thought I'd jist accost 'em, though, at the same time, as they were furriners, and strangers to our language, I used I must speak plain to 'em; mustn't come all Noah Webster, as though I was tackin' a professor, but jist give 'em a lit le simple, easy, nat'ral taste of English. So says I, arter a cough or two, "I reckon that we've got a most particklar good accomulation—'taint a long way t'other side, I reckon, of being no ways inconvenient." Now that speech, you'll say, was plain enough, and as civil as a bar gal's; but whether they were doubercus or felt like what they looked, young bears that wanted roking, I guess they still held fast and only stared the harder. So I thought I'd try agin, and, says I, "If I may be so bold, I s'pose you've come to London to see the Exhibition—jest that—the Exhibition?"

Well, good Uncle Eldad, if that warn't the shot, no matter! If that didn't ile their jaws a bit, and clap a fresh hinge on their grinders, then I'm no judge of smith's work. You've seen a feller woke by firin', Deacon; jerk'd up out of his sleep by a cannon or a thunderclap; well, I reckon this go diffused it. My last word was a peal to 'em! No sooner did they hear it, than they all jump'd up right an sendi, all bolted up as sudden as a meat stick in a pig trap, or a dog with a muskester. "Exhibition!" they sang out, "Wee, wee—yase, yase." And the feller in the further bed that I found out was a German, why he begun to "Yau" like a young donkey in good spirits. Well, all they wanted was a start, nothin' more than to be set agoing, like old Abner Cook's "perpetual motion," that he was all his life inventin', and died just as 'twas finished. "Consarn the thing," said he, "all it wants is to git agoing, and then 'twill go for ever; nothin' on airth can hinder it." And so I thought 'twould be with them. If they hadn't a stock of tongue on hand, then I never seed a ham-shop! If they didn't all go a head jist like colts at quarter racing—pelt away the hull on 'em, all ahead, and none the hindmost. And, in order to make more way, they help'd their tongues with their heads and shoulders, and talked pretty considerable, I may say, with their whole bodies. So 'twas lucky, you see, for me that I'd been a 'spector in a dumb school, and larnt a little telegraphing, or I should have been altogether nonplush'd. Well, as soon as they were winded, I let out again myself, and jist by way of introducing my opinions to 'em ginrally, I said I was an Amerykin—a citizen of our free and great Republic of the West—when, talk of galvanic batteries—talk of all the shocks that ever sot a frog's leg or rabbit kicking, if you'd only seed 'em then, Deacon, only just a look'd at 'em when that nose was fairly swallow'd! I vow if I didn't think at first that the whole tote was going to murder me! that I'd got among a lot of Mexicans who'd lost some land in Texas, and were a going to divide me in return, upon independent principles. They sprang to, bolt out of bed, and all giving the darndest yell, afore I could rise or holler had their arms as tight about me as if they were going to hoop a rum cask! "Hallo!" says I, "hallo!" and was just about to bellow, when what do you think it meant, Deacon? Why I swon it 'twarnt affection! If they didn't call me "brother," as I was a republican, and tell me they were all such themselves, and more than that, all sociableists or socialists which, of course, explained at once their uncommon social manners. Well, arter this was over, and they'd wrung my fist half out of join', back they went to bed again, and started another race at talking, and about as quick again as t'other one, setting up a roar that would have skeered a western clearin. When arter straining my ears an inch to see if I could catch suthin', I guess I went to sleep, and dreamt I was in a waggin, going over old Niagara. Now I want to know, Deacon, if this adventur hadn't a moral in it? If it didn't shew the good of bringing divers folks together? All thro' the little accident of our sleeping on one floor, here were the natives of three countries made good friends for life; and even s'posing we'd been enemies, I my the result would have been the same. Misfortun' makes men brothers, and arter passing the night we did, jamm'd up agin a roof with scarcely room to stretch or breathe, I want to know if we shouldn't have ris, and felt we'd all had our revenge!

But now to go ahead. You larnt from Uncle Enoch what was the noos I heard at Plymouth; the noos of the discovery that had jist been made in London—nothin' short of a grand conspiracy on the part of all the furriners, who owed a grudge to England, to burn down the mammoth city, and overturn the Government! If it warn't, may I be shot! A plan to take advantage of the occasion of the 'world's meetin' to open another exhibition, one of human spite and wickedness, and show the industrial energy of all the devils that are out of work. Not that it had come to a head; the mischief was still inside the egg, but it was within a day or two of hatching, when the young scorpions it was reckon'd would be ready to waddle out. So, of course, when this was told me, I didn't take to tooth-picks, didn't think of keeping off and rocking out the time till the expension had taken place, and the scatting was over. I saw it consarned my character to be upon the spot, to help to put down the rumpus, or at least show I wasn't engaged in it. So up I came, of course, and the first job upon my hands was to go out the followin' mornin', and make sure the noos was true; to take a survey of the hull city, without lettin' out my object, and whatever I say or think, of course report it to the Government; and, as every one's aware of my strong observing faculty, a sorter forceps that I can poke into any hole or cranny, grip a fact and drag it out with it, I felt I was just the feller for this highly important dooty, and might possibly create a better feelin' twixt the countries. So, soon as I got breakfash, off I set upon this errand, to make a tour of the mammoth city, and see what there was about it that was both mighty and suspicious; and arter nine hours' steady walking, I s'pose I'd a right to speak, had some ginral sort of fancy, both of its spirit and its bulk. And what did I discover? In my day's hunt for conspiracy, what did I turn up? Why I rather think jist this, that I'd got into a workshop, and about the grandest in the world. From one end of this everlastin' human wilderness to tother, from its north side to its south, in its streets, or docks, or houses, all I could clap my eyes on was one eternal heap of working; every feller doing suthin', and doing it full pelt. All were blind to with the same restless, busy spirit. All had got an end, and all a motto, "Go ahead." Now I s'pose I needn't tell you that this widened my eyes a little. I thought that in point of industry we whipped the hull creation—beat everything in quickness, unless an antelope or telegraph. But I guess it's a mistake, Deacon. These London folks can sling it; for they don't only work in working, but they work on their amusements. If you see a chap on horseback, he'll take ten times as much exercise as the critter does that's under him; or the ladies in their coaches, it's just the same with them, I guess they cannot be quiet, for s'posing their tongues are resting, dont they work their eyes about most terrible.

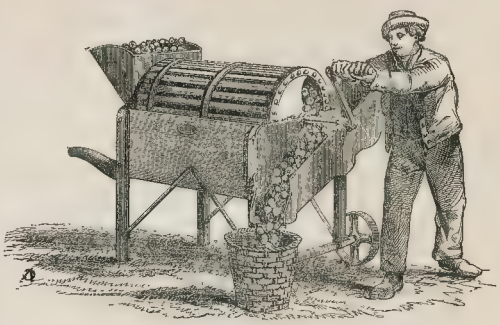
Well then, I s'pose you'll say there warn't no conspiracy at all. Well, I vow if I saw a mossel, unless 'twas gals and boys conspiring agin their fathers' pocket, or a wicked little widder agin a feller's liberty; or in a tavern I turn'd into, a sorter general conspiracy agin all kinds of trouble, among the most uncommon merry varmints that ever jingled spoons together. And so, of course, you'll ask me—London being look'd at—how about what follow'd it? How about the next sight in the list of the world's wonders? The Warehouse of the World—that house that is a hull year I had thought and talk'd and dreamt about, as if it had been my own existence—that I had publicly pronounced to be the first business of the day—that I had proclaimed as the ruling object, and grand focus of our speshy—that house of glass and iron that was big enough to kiver all the samples of the world, and yet able to stand a shove from the universal shoulder—that hall sale sorter sky-light, over the great fraternal storeroom—that grand hot-house where the plants are to be moral ones, and amaranths, and the heat to be that of natur pouring straight down from the sky. How when I got up to it? Well, as to-day, Deacon, is the 30th, and to-morrow is the 1st; as it only wants twelve hours to the time the doors will open; as 'tis actually to-morrow that the Congress will begin, and the hull world will set to work shaking one another's hands; as the buildin' is all finished, and the goods are all arrived, and the flags are all up and waving, and the seats and centres are all fixed; as the hull city is in commotion, gitting ready for the morning, and about a million on 'em at least that won't go to bed at all; as there's nothin' doing right and left, but jist one stir of preparation—the Prince gitting up his speech, and the Queen gitting up her answer; the commissioners brushing up their manners, and the exhibitors their goods; the gals working at their dresses, and the sogers at their guns; and as, in addition to all this, I'm e'en amost used up, and caterwampus'd with my walk, and for all that must see to my rigging afore I go to bed—git my blue coat out of wrinkle, and my calf-skin bootees stritch'd, and jest stir a big frill'd shirt, and find my Mexican pearl brooch, which, if it didn't come out of an oyster, is, at any rate, as big as one—I'm downright compell'd, you see, to tell you all by the next ship.

Your hopeful and affectionate,
PELEG E. WHEELER.

(To be continued.)

CROSKILL'S ROOT-WASHER.

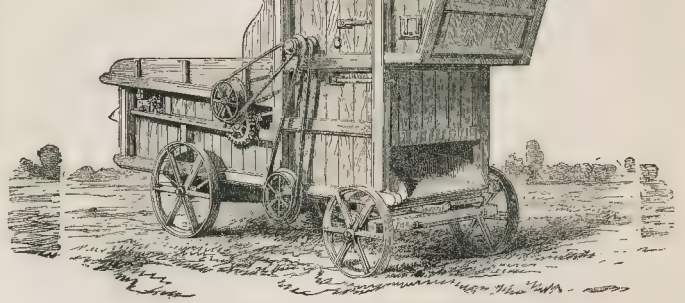
This is a very simple and convenient machine, in which the principle of the Archimedian screw, has been ingeniously applied. The roots are delivered into a hopper, and pass thence into an inclined cylinder, having two chambers, in the first of which they are confined and washed by turning the handle in one direction; when thoroughly cleaned, the motion is reversed, and they pass into the second chamber, which is constructed in the form of a spiral, along which they pass until they drop into a spout outside. It is well adapted for carrots, potatoes, turnips, and most other roots.



CROSKILL'S ROOT WASHER.

CLAYTON, SHUTTLEWORTH, AND CO.'S THRESHING-MACHINE.

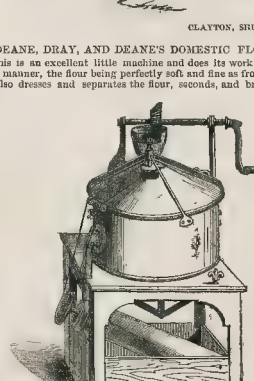
This is an excellent specimen of the threshing-machine in its most improved form. The most recent improvement consists in the vibrating trough, which extends the whole length of the machine and straw-shaker, and has a reciprocating motion given to it by means of a crank. The great quantity of pulse, or colder, which drops through the bars of the straw-shaker, has long been considered very objectionable, inasmuch as it increases considerably the amount of labour in the barn, both at the time of threshing and also when going through the dressing-machine. By means of the vibrating trough, the whole, as it drops from the threshing-drum and straw-shaker, is caught, and passed over a riddle, under which the blast is directed, thereby effectually separating the corn, chaff, and pulse from each other, each being discharged into the place assigned for them; thus effecting a considerable saving in manual labour over the old method of threshing.



CLAYTON, SHUTTLEWORTH, AND CO.'S THRESHING-MACHINE.

DEANE, DRAY, AND DEANE'S DOMESTIC FLOUR-MILL.

This is an excellent little machine and does its work in a very superior manner, the flour being perfectly soft and fine as from a large mill. It also dresses and separates the flour, seconds, and bran at the same time, and in such a manner as we should not have expected in so small a machine.

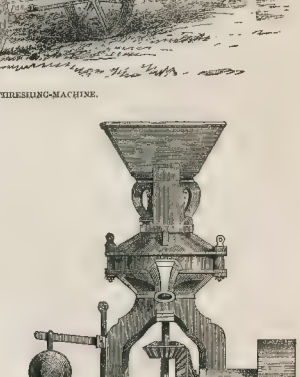


DEANE, DRAY, AND DEANE'S DOMESTIC FLOUR-MILL.

Messrs. Deane, Dray, and Deane seem to have succeeded in producing that which has long been a desideratum, namely, a good and effective hand corn-mill, for occupiers of small holdings and emigrants.

CROSKILL'S UNIVERSAL MILL.

This machine is likely to be a great boon to agriculturists, as a variety of operations are effected by it that usually require a separate machine for each. As a grinding mill, its powers seem to be unlimited; flints, coprolites, bones, &c. being reduced to a fine powder with apparently as much ease as barley or wheat. It also splits beans, bruises oats, crushes linseed, &c. Its action consists in two plates running in the same direction, and at the same velocity, but not on the same centre; hence it is sometimes called the Eccentric Mill. We have engraved a section through the grinding plates, to illustrate more clearly the principle of its action.



CROSKILL'S UNIVERSAL MILL.

THE SLAVE IN THE MARKET. BY R. MONTI.

Signor Monti's veiled subjects we have already discussed at some length in our fourth notice on Sculpture. One of these figures, which, we must observe, is meritorious in treatment in other respects than the veil, we now engrave. It is supposed to represent a Circassian slave in the slave market at Constantinople, though these conditions are by no means all essential to its accurate description

Touching the veil trick itself, which has attracted so much notice, we may mention that it is by no means new, though, fortunately, we have had but few previous examples of it. In the church of Santa Maria della Pietà, at Naples, are two remarkable instances of similar perversion of art. They are portrait statues, erected by the Prince Raimondo di Tamevero to his father and mother, about the middle of the last century. The female figure was wrought by the Venetian sculptor Corradini, representing the Princess under the emblem of Modesty. "It acquired great renown at the time," says Duchesne, in his notice of it in the "Musée de Peinture et de Sculpture," "from the singularity of seeing a face covered with a veil, light enough to show full shape of the body, which, unfortunately, is not handsome." Combined with this "singularity," now no longer

VEILED SLAVE IN A MARKET.—(MILANESE SCULPTURE.)

"UNA AND THE LION"—BY JOHN BELL.

singular, we remark concurrently in this work bad taste in the arrangement of the drapery, and other vices of detail, as the introduction of a garland lying across and breaking the outline of the figure. The other example referred to, which is also engraved and described in the "Musée de Peinture et de Sculpture," is a still more extravagant feat of art. It is from the chisel of Francesco Gaggini, a Genoese sculptor, and is called the "Sinful man undeceived." "It represents," says the writer previously quoted, "the father of Prince Raimondo, partly enveloped in a net, of which he is seeking to rid himself. The artist alludes to the situation of that prince, who in the course of his life often let himself be carried away by vice; but who, at a later period, and enlightened by his genius (the good genius is represented as an angel in smaller dimensions), reverted from his errors. The net is in marble, as also the statue and all the accessories, which must have produced great difficulties in the execution, as it adheres but in a very few parts. The appearance of this coarse envelope contrasts with the high finish of the flesh parts. This difficulty overcome is the principal, and, it might almost be said, the only merit of the group."

PLASTER GROUP—PAOLO AND FRANCESCA. BY A. MONRO.

Mr. Munro, in this little group, seeks to realise the incident described by Dante, or rather by his heroine, Francesca, for she is supposed to relate her own sad story to him, in the following passage, as translated by Carey:—

> ——————— One day,
> For our delight, we read of Lancelot,
> How him love thralled. Alone we were, and no
> Suspicion near us. Oftimes by that reading
> Our eyes were drawn together, and the hue
> Fled from our alter'd cheek. But at one point
> Alone we fell. When of that smile we read,
> The wished smile, so rapturously kiss'd
> By one so deep in love, then he, who ne'er
> From me shall separate, at once my lips
> All trembling kiss'd. The book and writer both
> Were love's purveyors. In its leaves that day
> We read no more.

We need hardly say a word to point out the difficulties which too obviously surround the treatment of such a subject in sculpture; at least, if it be attempted to represent *all* that the poet conceived of it. One point referred to in the passage, "the hue fled from our alter'd cheek," it, is impossible to render through this medium, because it is a material *always* colourless; and even to convey the idea of strong emotion as conveyed through the eyes, is a thing which has never been attempted in the plastic art.

CARVED PICTURE-FRAME.—TUSCANY.

Nevertheless, Mr. Monro, who is a young artist of very considerable promise, has produced a very pretty and graceful composition, though at the same time one which, costume, accessories, and all considered, would have been better adapted for a painting than a work in plaster. As regards expression, he has certainly accomplished a great deal—much more than we would have been prepared to expect: the face of Paolo is earnest and impassioned in the extreme; it tells of a devouring passion long pent up, now first revealing itself; that of Francesca confesses a reciprocity of feeling, but with a modest hesitating reserve, which is admirably true to the more delicate poetry of the situation.

UNA AND THE LION. BY JOHN BELL.

We give an Engraving of Mr. Bell's plaster group of "Una and the Lion," upon which we made some observations, not very favourable, in our second notice upon Sculpture. The reader may now judge for himself of the propriety of these remarks. As for Una, she is, comparatively speaking, nobody; the Lion, encircled with garlands of flowers, with a little bird perched upon his back, is the hero of the piece, and a rough-looking customer he is. It may be proper to add that this group is a copy, with additions and improvements, of one already favourably known to the collectors and admirers of porcelain statuettes.

CARVED FRAME. BARBETTI.

This is a very beautiful specimen of the wood carving of Signor Barbetti, of Florence. The birds, in high relief, are finished with extreme delicacy.

PSYCHE. BY P. FRECCIA.

This very pretty marble statue stands in the Tuscan room, where it is deservedly admired for its gracefulness of conception and delicacy of finish. We shall reserve further observations upon it at present, however, as it will be included in a general notice of the works of sculpture in the Italian department, in a future Number.

THE GREAT EXHIBITION.

ON DECORATIVE ART.

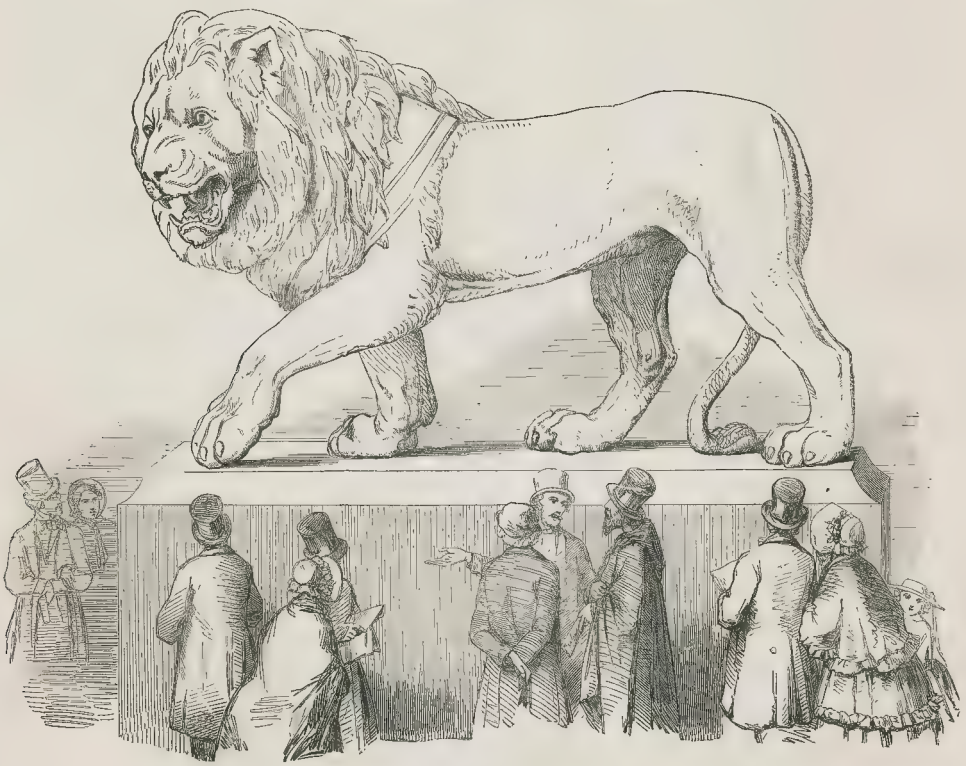
THE ornamentation of works of utility is a subject which, after very long and almost total neglect, is beginning to engage the attention as well of producers as of those who employ them, and which it may be interesting to consider in reference to the examples presented in the Great National Exposition. The subject is a very wide and a very inviting one: we shall endeavour, however, to restrict our observations within the limits of the practical bearings of it. Yet, in doing so, we must not omit to point out what we conceive to be the legitimate province over which such an inquiry might extend, as it involves a necessary relationship, in an æsthetic point of view, of several branches of art hitherto having little connexion with one another, but which, nevertheless, have strictly common interests, in this at least—that for success they must conform themselves to the prevailing taste or prejudices of the age. The rule is imperative—there is no escape from it; and though fine art may pretend to turn its back upon useful art, it is difficult to say where the province of the one begins and that of the other ends; whilst it is positively certain that where fine art has "no connexion" with useful art, like other fine people amongst a non-productive community, its resources become sapped, and it dwindles to decay. What is architecture but building upon principles of taste in which the eye is consulted? the same "taste" which prescribes the form of a hat and the fashion of a sleeve? The chain which connects all the handicrafts employed in the various intermediate matters of social requirement may be a long one, at some points a slight one, but still it is an unbroken one, and will make itself felt sooner or later. As between architecture and internal decoration and furniture the links are very palpable in the recent adoption of mediæval models; where the wood carver and the upholsterer very quickly followed upon the heels of the builder, and where the artificers in silver, and brass, and potter's clay, and now the book-printer and bookbinder (to say nothing of the writer of books) and the embroiderer of silks and woollens, and the whole host of those who minister to the need and fancy of others, are with very great precision following upon the footsteps of one another, or, rather, walking hand in hand over the same path. How long it may be before the tailor and hatter join in the march, and turn us out into *ye streete aff Bondile;* "a fine old English gentleman" after the fashion of his forefathers of the thirteenth century, we do not pretend to guess.

There should be a nice and critical scrutiny of the principles of art evinced in every class of works from the highest to the lowest, if we would hope to educate or guide the public taste in these matters. There is no doing things by halves, and fortunately so, as we think; for the same course of culture which brings the judgment to correct appreciation of excellence and beauty in the structure of a palace, will apply equally to the fashion of a dress, and the ornamentation of the material of which it is composed. The same principles of harmony, the same rules of propriety, the same submission to the dictates of common sense and common fitness which regulate the one, regulate the other also. And surely not without justice, surely not ignobly, is art, high art, employed, if, whilst it builds and decorates temples for man's resort, it decorates man also—if, whilst it paints the portraits of our wives and daughters in the most becoming costume, it gives some hint how we may have the originals as advantageously "treated" in that respect when at home.

This brings us at once to a consideration of what has been done towards this art-culture—what has been done towards the accomplishment of this only profitable "Art-Union"—we mean the association of decorative art with art purely useful. We should observe that (speaking of modern times) it is only very recently that the idea of such an association entered into the minds of men: fine art always before that sticking to its picture-frame; useful art to the stocking-frame and the loom. And now that they have consented, as it were, to a conference, with a view to establishing a commercial league, it is not without considerable misgivings, and reserve, and jealousy, resulting from an imperfect understanding of their relative positions and their common interests, that they go on, or stand still over the matter. The great difficulty at present, as it appears to us, required to be settled, is, where art ends, and where handicraft begins—the middle ground upon which head and hand may work together. In a cabinet picture for the annual exhibition, and in the manufacture of a coarse calico, there is no room for doubt upon this point; it is where the picture and the calico require to be combined. So, in the building of your house, the R.A. is your man to superintend, and take his percentage of commission; but when it comes to the carpeting and furnishing, upon which, as much as upon the actual disposition of the stone-work, the comforts and "effect" of your new mansion depends, he leaves you to the upholsterer and the carpet manufacturer. He will not take commission out of wood-work and woollens. Yet it was not always so—it is not so to the full extent now abroad; and when we all know our own interests better, it will not be so with us. The advantages of a co-operative association of art and handicraft will neither be one-sided nor short-lived. Art will educate and reclaim a larger field in the public mind; will, so to say, create a taste to which it will afterwards profitably minister;—handicraft will, by means of improved and novel designs thus placed at its disposal, be enabled to compete with the markets of the world, from a bold and independent ground, which it does not occupy at present; finally, the artificers employed in this joint production will have constant opportunities of developing their inventive talents, and of advancing their position beyond that of mere live mechanism; and England, instead of being for ever a mere nation of shopkeepers, may become the art-producer of the world, and the founder of a new school worthy of bearing its name.

For want of this application of inventive and original taste to handicraft, the latter, left unaided and in the dark, has had, through a series of generations, to resort to mere copying of favourite models of former periods—models more or less meritorious in themselves, but whose merit consisted mainly in their originality, and their general conformableness to the prevailing tastes, and the prevailing fashions in other matters, of the time in which they were produced. Thus have we constant boastings of pure *cinque cento*, pure *Renaissance*, pure Elizabethan, pure Louis Quatorze, and most abundantly of all pure *rococo*, as though these were passports to honour and favour, instead of simple confessions of bankruptcy in idea, and almost hopeless extinction of inventive faculty.

It is now fifteen years since not only the public, but the Government, began to awake to a full appreciation of the miserable state of darkness in which the country lay in respect to all that related to the ornamental



COLOSSAL BAVARIAN LION

COLOSSAL LION.—MÜLLER.

THE monster of the forest stands 16 feet from the head to the tail, and 9 feet high. Having said which, there remains little more to be added, save that it stands in the Eastern Nave, courting the gaze of all who are curious in lion-flesh. For the animal itself, with many thanks for this contribution—all the way from Munich—we must say that we have many better lions in this country, the noble beast at the top of Northumberland House, for instance, whose erect bearing might be studied with advantage by the Bavarian sculptor. There is, or used to be, also, a brass lion at the corner of Berners-street and Oxford-street, which we consider superior in many points to M. Müller's. Upon the whole, despite the acknowledged taste of the late King, and the attention and money bestowed by him for the encouragement of art, Bavaria does not figure very favourably in this respect in the Great Exhibition of 1851.

part of manufacture—a circumstance which it was proved militated very seriously against the commercial prosperity which we are otherwise entitled to enjoy; and seeing the hopelessness of a spontaneous movement on the part of high art in aid of its humbler brother, it was resolved to establish Schools of Design, with a view to affording elementary instruction in the arts applicable to the decoration of manufactures, &c. The establishment of the Government School was quickly followed by that of others, some subsidiary, others independent, in various parts of the country. What the result of these efforts has been, may be gathered by those who take interest in the advancement of their kind, by inspecting the exhibitions of works of students which annually take place; but as yet, we are told, there has been little direct effect upon actual manufactured productions.

In simple truth, the school of design system, considered in reference to what was expected from it and what has been done for it, has proved a failure. The cause of this failure has been much and angrily discussed by several parties who have been more or less mixed up or interested in the scheme; but, upon a calm revision of the whole case, we think it may be summed up in very few words: *first*, the schools of design have been too limited in the field over which their influence was proposed to extend, being restricted chiefly to the manufactures in which patterns are artificially multiplied, and not touching the higher branches of decorative production, such as architectural design, wood-carving, room-furnishing, &c., to which textile manufactures are but tributary; *secondly*, the instruction has for the most part been limited to mere copying, whether by drawing or modeling, of actual objects, whether natural or manufactured, no attempt having been made to inculcate the principles of design, as design, much less to encourage the inventive powers and educate the tastes of the pupils: the consequence is, *thirdly*, that the latter having been left to their own devices, with their mere acquired faculty of imitating actual objects, without any sound principles as to the selection and disposition of those objects for decorative purposes, having regard to their respective fitness as embellishments of various classes of productions to which decoration may be applied, have (with few and trivial exceptions) failed of producing anything which has proved worthy of practical adoption by our manufacturers; so that, whilst they themselves have but little advanced their stations and prospects by years of study, the manufacturing taste of the country is just where it was before the scheme was started.

We have too much reason to apprehend that this unpropitious state of things is in part attributable to the very men who would be most benefited by an opposite result; that the textile manufacturers, with whom the concoction and plagiary of patterns has always been a sort of mystery, have viewed with jealousy the attempt to educate pattern drawers by scores in every manufacturing town in the country. They see in all this, abundant means of competition, but none of advancement; and knowing that art, as involved in design and colour, can only be successfully applied to manufactures by one who understands the technical details of the latter, in which branch it may happen to be, they have too generally refused to give their aid to the general cause by enlightening their students of art in the mysteries of their handicraft. Mr. Thomson, of Clitheroe, in his evidence before a committee of the House of Commons, indeed, very clearly lays down the views which manufacturers have commonly entertained upon this subject, and we quote a passage from his evidence, the more readily as the committee in their report particularly refer to this witness, as "a gentleman of great taste and experience in manufactures." Mr. Thomson says:—

"The manufacturers of England want educated designers; and they look to your schools for that instruction to our young men which will train the eye to an accurate perception of beauty, and form, and harmony of colour, and the hand to the correct delineation of it, and thus lay the most solid foundation for the application of design to that branch of industrial art in which the student decides afterwards to engage. In six months they will learn more technical skill relative to their own art in our workshops and manufactories, than we could teach them in six years at Somerset House. Besides, who is to teach them? Are you to have a master or professor of pattern drawing in every department of industry? for calico-printing and its subdivisions furnitures, shawls, dresses? for silk-weaving in its subdivisions of rich damasks, furnitures for kings and princes, dresses for the refined and the vulgar, and a hundred articles of fluctuating fashions in scarfs, shawls, ribbons, &c.? Where will you find the universal genius that is to teach all this? or will you have a master for each? You will advertise, and the handsome salary will bring you hosts of broken-down pattern-drawers of all sorts, who, though unable to get employment in a manufactory, or find a sale for their own designs, will yet boldly undertake to teach everything in your school. Beware how you exalt the double and unprofitable, and eventually lose the confidence of the manufacturers themselves, by failing, as you assuredly will do, in the attempt to do that which it is impossible you should ever succeed in."

Although it is two or three years since the above observations were made, we have reason to believe that they correctly describe the opinions and views of the great bulk of the manufacturers of this country, at the present moment, who have not yet got rid of all their apprehensions and misgivings about pattern-drawing and art movement. If the concourse of genius and industry now in Crystal Palace does not do more than rub away a little of this rust of prejudice, it will have achieved a great and certain good to the whole industrial community of this country.

HOROLOGICAL SECTION.

(THIRD NOTICE.)

We proceed to examine the contents of the fourth counter in the British department, reckoning from the eastern "wall space," and find one of the most useful contributions (No. 124), in this part of the Exhibition, from Messrs. Rotherham and Sons, of Coventry, whose interesting workshops we have more than once visited. We believe their establishment to be the only one of the kind in England, in which machinery impelled by steam power is employed for performing many of the almost innumerable processes in the completion of a watch. The contribution we have alluded to consists of the various parts of a lever watch, in the progressive stages of manufacture. Thus we find the top plates, pillar plate and cap, cap spring cock, name bar, potence, wheel bar, regulator, pendulum, stud, detent, detent spring, stop, stop spring, index, bolt, bolt spring, dial wheel, click and ratchet, click chain, barrel cover, barrel arbor, fuzee, collet, main or great wheel, maintaining power spring, maintaining power wheel, fuzee, roller, lever pallet, escape wheel and pinion, third wheel and pinion, centre wheel and pinion, compensation balance; then there are specimens of jewelling, pendant spring, ruby stones, jewel holes, cases, and rings for glasses. All the above are shown as roughly cast, then as formed into proper shapes, and lastly as finished. Several movements are also shown, and a beautiful display of 137 watches of all kinds, from the plainest silver watch to the most elaborately finished and ornamental watch of gold. It would be well if the analysis of a watch, exhibited by Messrs. Rotherham, as also the various escapements and large models of watches contributed to the Exhibition by other makers, could be permanently deposited in some proper receptacle in London, as forming an illustrative exhibition not only of a very interesting but highly instructive character.

80. On the same counter, Mr. Thompson exhibits his auto-chronograph, for the instantaneous stamping or printing of time.

86. Three plain watches in front of pouches, intended for guards of railway trains, are exhibited by Joseph Fairer.

85. From the celebrated house of Dent, in addition to the large turret-clock in the nave, is a goodly display of chronometers and watches of various designs and for various purposes. We particularly noticed his improved patent chronometer, with secondary compensation to correct extremes of temperature; and with varnished steel balance spring, a common marine chronometer, and a second example of his patent chronometer; but, instead of the balance-spring being varnished, it is gilt.

64. Eleven gold and three silver watches, good samples of Mr. Jones' manufacture suspended from the branches of a metallic tree.

William Turner exhibits a clock showing simultaneously the time in London, Edinburgh, Dublin, and Paris. This description of horological contrivance is not confined to England, as we have already mentioned similar inventions exhibited by our foreign competitors.

Parkinson and Frodsham exhibited two marine chronometers, and ten gold watches, of first-rate manufacture.

68. Charles Mac Dowall's patent single pin dead escapement, in plain case, is on the same counter, and also numerous horological specimens exhibited by Charles Frodsham, of the Strand, including marine chronometers, gold pocket-chronometers and lever watches double rotary escapement, day of the month watch; gold lever watches with split centre, second's hand movement, railway watches; English pinions for astronomical clocks, carriage clocks, portable chime clock, chronometer and watch movements, diagrams of calibres of chronometers and watches; gauges for admeasurement of watchwork to the thousandth of an inch, specimens of gold watch-cases, and the new calibre.

106. W. J. Evans exhibits one small and three large skeleton timepieces: the design of one of the latter represents the monument of the late Sir Walter Scott. Adjoining the above are shown an octagon-shaped hall clock, with quarter-seconds, and a second clock with radiated gilt face.

117. John Page, of Bury St. Edmund's, exhibits a fine skeleton clock 28 inches in height, which requires only *once winding* in *three years*. The power is obtained by six springs of the united force of 250lb., which are enclosed within as many brass barrels: three of the springs are connected by wheel-work to a fusee on the right hand, and three on the left hand. The power is thus concentrated in the pinion of the second great wheel, and is conveyed up the train of wheels and pinions to the pallets which are connected with the pendulum, the power being reduced to that of a few grains only, it is sufficient to keep the pendulum in constant motion. After the clock is first wound up, the chain is unwound from the smallest part of the fuzee, three turns of which allow the barrel to revolve once in 210 days. This is believed to be the *slowest motion ever produced*. By this clock the day of the month and the number of weeks and years during the time it has been going are registered. A spirit-level is attached to the base, so that the clock may be placed for certainty in a vertical position.

Mr. Page also exhibits a pyramidal-formed skeleton timepiece, 28 inches high, which goes three months with only once winding. The hour-dial is placed at bottom, in order to display the wheels in motion. It has Graham's dead-beat escapement. The hands are moved by novel but simple machinery.

71. Lucien Marchand contributes thirty-five watches of various designs and constructions, as also a curious musical clock, which requires winding only once in a month. It has independent seconds. On one side is a magician with a wand, who, at certain intervals, rises from his seat and points to an answer to any of twelve set questions which may be proposed—the whole being arranged in connection with the clockwork. On the other side is a bird perched on a tree, which sings at certain intervals. The music is from four popular overtures.

Parkinson and Frodsham, in addition to the articles already mentioned, exhibit a table-clock of very ornamental design.

J. Driver, of Wakefield, exhibits a handsome skeleton clock, which strikes on eight bells, and is supported by four lions made of terra-cotta. By this clock, the time in any part of the world may be ascertained at pleasure.

104. A large transparent skeleton spring timepiece is contributed by J. Edwards, of Stourbridge. Some of the wheels are constructed of brass and glass connected together—quite a novelty in horology.

John Donegan, of Dublin, exhibits twelve gold and twelve silver watches, of neat design.

158. G. Lovejoy, of Reading, contributes a twenty-one days timepiece, with "invisible mechanism."

155. Sanders Trotman has a novelty in the shape of a "Night-lamp Time-indicator." The regular consumption of camphine is the power employed to indicate, by means of an index, the time of night.

A clock of Egyptian design, with a sphynx at the top, is exhibited by Thomas Adams, of Lombard-street.

37. P. Robinson, of Bishop Auckland, exhibits a skeleton clock, striking on three bells: the design is that of the clock-tower of the Bishop of Durham.

C. Hinton has sent specimens of English hard white enamelled watch faces.

131. J. Young, of Knaresborough, a small skeleton clock, striking on one bell.

118. Watch and clock fuzee chain and hook, exhibited by W. Hare, of Christ Church, Hants.

103. A portable spring time-keeper, requiring only once winding up in 426 days; manufactured by J. T. Edwards, of Dudley.

"*Ne nimio ultra crepidem*" has not been attended to by "*A scorching shoemaker* resident in London," who has invented, designed, and made a 32-day skeleton timepiece, with detached escapement, having fewer works within than usual. Surely this person ought to be encouraged in the more philosophical business which he has entered on.

J. Kaisir contributes a plain table-clock.

81. Messrs. Pettit and Trappett exhibit a silver watch, which is suspended in a globe filled with water. The object of the invention, the exhibitors say, is to secure the works from sea water, &c. This is the last article on the fourth table.

(To be continued.)

BRITISH AGRICULTURE.

BY THOMAS ROWLANDSON, F.G.S.

PART XI. KENT.

Area .. .. 972,240 acres | Population 548,337

THREE sides of this county are washed by the sea, including in that term the estuary of the Thames. It may be classed as one of the metropolitan counties, the borough of Greenwich being situate within its boundaries. Taken as a whole, Kent may be pronounced the most beautiful county in England. It also has a more varied character of general farming than any other county, being famed for its hops, wheat, sheep, fruit, and market produce (such as green peas, &c.) In consequence of its generally fertile character, added to the high manuring practised by the farmers of this district, particularly in the neighbourhood of the metropolis, and for which its extended seaboard and vicinity to London gives such favourable circumstances for its cheap conveyance, it may, perhaps, be safely asserted that no other county of like extent makes such a large annual money return as that under notice.

The ancient civil divisions in Sussex are termed "rapes," in this county they are called "laths."

Excepting occasional north-eastern winds during spring, the climate of this county is congenial to both health and vegetation during summer and autumn, being considered invalids than the south of Devonshire; but not so well adapted for weakly constitutions during the severity of winter and spring, the moister climate of Devonshire during the latter periods being warm, and consequently better adapted for the indisposed.

Isle of Thanet.—The subsoil of this district is a dry hard chalk, the more elevated portions of which are generally situated about sixty feet above the level of the sea; consisting of a surface soil, composed of a dry loose chalky mould, from six to eight inches deep; is mixed with flint, and, when broken only, is poor soil. The vales between the ridges and the flat lands on the hills possess a deep, dry, loamy soil, from one to three feet thick. The west end of the island, even on the hills, has a good mould for its surface, from one to two feet deep, rather inclining to be stiff. The deepest and best soil in Thanet lies on the south side of its southernmost ridge, running westward from Ramsgate to Monckton, where the soil is a deep, rich, sandy loam. Owing to the open character of the subsoil, the low lands are generally sufficiently dry to be ploughed flat, without the intervention of furrows. The soil on the marshes is a stiff clay, mixed with sea-sand and minute sea-shells.

Canary Seed.—Considerable breadths of the best land in the Isle of Thanet is sown with Canary seed, for the use of singing birds, usually taking in the rotation the place of wheat; viz. after clover leas, bean stubbles, and fallows. If the land be not naturally rich, a dressing of rotten dung is applied previous to sowing the crop. Whether manured or not, the usual course of tillage is to plough the land the first opportunity that offers after the sowing is completed in autumn; and, as soon as the land is tolerably dry in the spring, the seed is sown broadcast, at the rate of about four or five gallons per acre, which is well harrowed in. When the blade appears and the rows are distinct, the intervals are hoed with a Dutch hoe; which is repeated in May and June with the common hoe, carefully cutting every weed, and thinning the plants in the furrows, if sown too thick. It is harvested later than any other crop; it is cut with a hook called a twibil and a hink, by which it is laid in lumps, or wads, of about half a sheaf each. The seed is strongly attached to the husk; and, in order to detach it, the crop has to be left for a long time on the ground before the seed becomes sufficiently loosened to thrash. The wads are occasionally turned, and have been known to remain in the field until December, without vegetating or suffering injury. The produce is from three to five quarters per acre. The straw forms admirable fodder, and is much relished by horses; in fact, there seems no good reason why this plant should not be grown extensively as a forage plant on strong lands, particularly as the seed is a much more valuable crop than wheat.

Radishes are also sown extensively for seed in this district, the produce being sold to the London seedsmen.

Much sea-weed is used as a manure in the Isle of Thanet, of which a strong north-east wind always drives large quantities on to the shore. After a heavy sea, numerous carts and waggons may be seen lining the coast, for the purpose of carrying it away. The sea-weed is sometimes applied to the land in the green state, but more generally mixed with the manure heap or composts.

East Kent.—The open part of the district between Canterbury, Dover, and Deal possesses a great variety of soils, consisting of boulder and London clay, chalk, and the alluvial soil (warp) of the marshes. The more elevated chalk soils are generally occupied as sheep-walks; the arable soils are not under any precise rotation, the wet clays being, however, usually occupied with beans and wheat alternately: the beans are either drilled or dibbled, the sorts usually cultivated being maragan and ticks. The celebrated white wheat of Kent is produced in this district, and is commonly sown broadcast: the reaping is accomplished by mowing or bagging. In mowing a cradle is fixed to the scythe, and the mower *strikes in* towards the standing corn, which is afterwards bound into sheaves, and the scattered straws raked up by a hand or horse-rake. "Bagging" is executed with a stout hook, without teeth, in the form of a sickle: the workman strikes the instrument towards the standing corn, as near the ground as possible.

Downs.—The great dryness, not only of the climate but also of the land, in consequence of so large a part of it overlying a stratum of fissured chalk, turnips and green crops of the brassica tribe are not much cultivated on light lands; mangold wurzel has, however, been tried of late years, and found to succeed well, so that it now forms a fair substitute for those well-known and valuable light land green crops. This part of the county, lying close to the seaboard, is well adapted for obtaining manures from a distance; some descriptions, however, are rather peculiar, such as spratts, mussels, five-fingers (star-fish), &c., which are made into composts with earthy and waste vegetable substances. The cost of sprats for this purpose is usually about 10*d.* a bushel, 50 or 60 bushels of which, when used alone, are applied as a dressing for wheat; five-fingers, 4*d.* per bushel; 120 bushels to the acre. Mussels are usually bought by the waggon-load for about 20*s.*, and 150 bushels applied to the acre. Chalk is much used as a dressing on heavy soils. The Kentish turnwrist plough is in common use on stiff lands. East Kent hops are too celebrated to need further comment.

The East Kent sheep comprises at one time of more than 20,000 acres, and has been famed, from the most ancient times to the present day, for its sheep, the exquisite flavour of which rivals King Charles' Banstead mutton. The tenacious London clay is here extensively developed, in consequence of which the husbandry is not much improved, owing to which, the sheep-breeder is compelled at weaning-time to send his sheep to other districts, often 30 or 40 miles away, to be returned in spring. The ordinary rotation is six courses:—1, summer fallow, with manure, chalk, or lime; 2, wheat; 3, beans and clover; 4, wheat; 5, oats: of late, however, tares, potatoes, mangold, rape, &c., have superseded the superior fallow. Average produce:—Wheat, 4 quarters; beans, 4 quarters; peas, 3½ quarters; canary, 3½ quarters; oats, 7 quarters; clover, 1½ load, per acre.

Mid Kent, in which is situated the county town of Maidstone, has not unfrequently been termed "the garden of England," owing to the variety and luxuriance of its agricultural productions. A large portion of this district is formed of the greensand series, and is much occupied with the growth of hops and fruit. Within a short distance of Maidstone occur the principal plantations of Kentish filberts, which so abundantly supply Covent Garden. The filberts are carefully cultivated and pruned back, not allowed to exceed 5 or 6 feet in height, and are kept of a bush-like shape. The crop is uncertain, sometimes realising a large sum per acre. The greater part of the hops grown in this district are "the Goldings:" on stiffer soils less precarious varieties are cultivated, such as the "Grape," "Jones," &c.

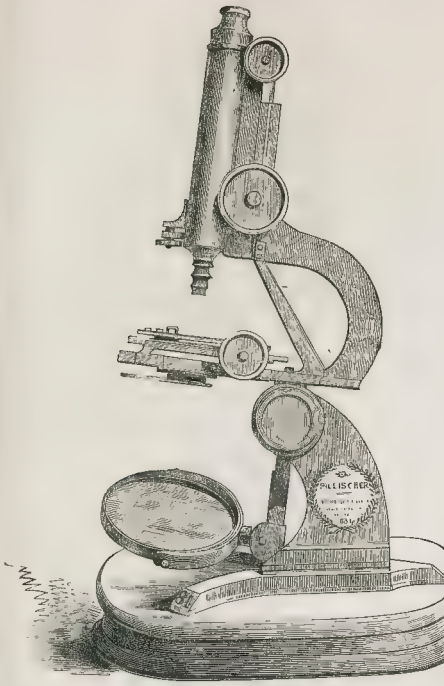
The most serious drawbacks are the great drawbacks on hop cultivation of the finer kinds, from which the coarser sorts on the Weald are often exempt. Owing to the great demand for hop-poles, coppice timber is much grown, every nook and corner being occupied in this growth. On some soils the rods are ready in eighteen inches deep; sixty apple trees are usually planted in an acre, the intervening spaces being filled up with hops and filberts. The hops are said to be beneficial to the young fruit trees by the shelter they afford, and, with the thorough cultivation and manuring they receive, cause the young trees to early bearing maturity. The hops usually stand about fourteen years, when they are taken up to allow more room for the trees. The filberts generally require removing in about twenty-five years, at which time the apple-trees require the whole of the ground. Pears require the land to be filled whilst young; but when arrived at maturity they bear and do well in pasture. Besides these fruits, gooseberries, raspberries, white and black currants, cherries, and plums are extensively cultivated. It is stated that mowing grass in cherry orchards is very injurious, causing the fruit to fall before it attains maturity, by suddenly exposing the surface of the ground to the action of a powerful sun.

The Weald is an extensive district occupying the southern portion of the county, the soil consisting of the Weald clay and the Hastings sands. The former is a strong yellow clay soil, of a cold retentive character; the latter consists of a series of alternations of sand, gravel, and clay, generally much covered with wood. Hops are extensively grown on the Weald, particularly in the eastern district. The Sussex breed of cattle are usually found in the Weald. The farms are generally small. On the eastern side of the Weald, bounded by the English Channel, is the rich grazing district of Romney Marsh, a level tract reclaimed from the sea, and which is protected by an embankment, upwards of three miles long, between Romney and Hythe. The Kentish portion of this marsh occupies 44,000 acres, almost entirely grazed by one of the finest breeds of sheep in the kingdom, if hardiness of constitution is taken into account, when being combined with heavy returns of carcase and fleece. Another breed of sheep—if not the parent stock—is worthy of notice, the county being indebted for the first improvements to Mr. Richard Goord.

North-eastern District.—This may be called the market-garden district, the low lands being principally occupied with raising market produce, and comprising the parishes of Greenwich, Woolwich, Deptford, Lewisham, Lee, Beckenham, Bromley, Chiselhurst, Eltham, Plumstead, to which may be added a belt of country, about four or five miles wide, between Gravesend and Dartford, the latter consisting of a light fertile soil, producing a large quantity of early peas, turnips, &c., for the London market. During the podding season, numbers of women and children are employed in pulling the peas, coming in swarms for the purpose from London, as also for hop-picking. The adhesiveness of the London clay soil is that part of Kent which supplies the metropolis is much ameliorated by the abundant application of long stable manure, and also by applying the spent bark from the extensive tan-yards of Bermondsey; these dressings, and the frequent application of soot, on clovers and young wheats, have, in some cases, altered the natural colour of the soil to a deep brown or black. Some of these market-gardens have more than 100 tons of stable manure annually applied. In this district, within ten or fifteen miles of the metropolis, it is usual on general farms to purchase the greater part of the straw and hay, purchasing manure in return. Some dairies are also kept for the purpose of supplying milk to the metropolis.

ISINGLASS AT THE EXHIBITION.—In Class 4 of the Great Exhibition, under the classification of "Vegetable and Animal Substances," will be found a display of isinglass in the bouse of Simpson and Humphrey, Little Britain, makes a very interesting display of isinglass, to show its character and different shades of colour, and also to illustrate the neat designs into which the article may be worked. Several of the specimens are formed into baskets, flowers, &c., and on the wall space a picture is exhibited composed entirely of rolled and cut isinglass. The inscription draws attention to the various colours, and states the whole of the samples to be entirely free from artificial colouring or the ingenious adulteration so extensively practised and lately reported in the columns of the ILLUSTRATED LONDON NEWS of November 9th, 1850. The sophistication is further alluded to by the exhibitor in showing some specimens of packet isinglass, designed to restore confidence among consumers by affording an easy guarantee for the purity of so delicate and important an article.

THIS SHEET WAS PRINTED IN THE GREAT EXHIBITION.



PILLISCHER'S MICROSCOPE.

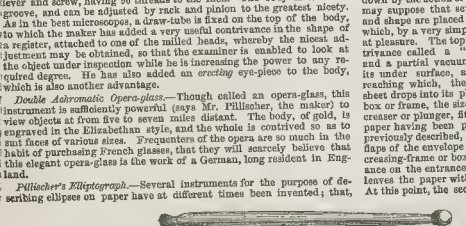
PILLISCHER'S MICROSCOPE.

Mr. Pillischer is one among the thousands of ingenious workmen who have lent their aid in accomplishing the great work of furnishing the Industrial Palace; and it would be well that all such men should be known to the mass of visitors who can admire the exquisite objects exposed in most departments, but who seldom stop to enquire who made them.

Mr. Pillischer, who is one of the best makers of microscopes in London, exhibits one of large dimensions, of exquisite workmanship, in order to show what can be done in his way. This beautiful instrument is the largest which appears in the Building, and is of the most approved construction, being in every respect properly placed as regards its centre of gravity. The stage is much simplified in comparison with those ordinarily used, and is worked by means of a rack and pinion, and Archimedian screw, the two pitches corresponding accurately with each other, giving 5ths of an inch motion for each revolution. The fine adjustment works with a lever and screw, having 90 threads to the inch. The body slides on a groove, and can be adjusted by rack and pinion to the greatest nicety. As in the best microscopes, a draw-tube is fixed on the top of the body, to which the maker has added a very useful contrivance in the shape of a register, attached to one of the milled heads, whereby the nicest adjustment may be obtained, so that the examiner is enabled to look at the object under inspection while he is increasing the power to any required degree. He has also added an *erecting* eye-piece to the body, which is also another advantage.

Double Achromatic Opera-glass.—Though called an opera-glass, this instrument is sufficiently powerful (says Mr. Pillischer, the maker) to view objects at from five to seven miles distant. The body, of gold, is engraved in the Elizabethan style, and the whole is contrived so as to suit faces of various sizes. Frequenters of the opera are so much in the habit of purchasing French glasses, that they will scarcely believe that this elegant opera-glass is the work of a German, long resident in England.

Pillischer's Elliptograph.—Several instruments for the purpose of describing ellipses on paper have at different times been invented; that,



WATT'S FIRST DESIGN FOR A LOCOMOTIVE.

however, which is illustrated by the two drawings, viz. a plan and elevation, appears to be not only simple in construction, but very suitable for its intended purpose. A is the standard, which is fixed, when required to be used, by two points through the paper into the drawing-board; B, the ratchet wheel fixed on the standard A; C, the handle which revolves in the standard A; D, the shifting bar which moves with the handle C, by which the diameters of the ellipses to be described are adjusted; E, the drawing pen or pencil; F, the rack, taking its motion from the ratchet-wheel B, and allowing the pen or pencil to move with it; G is a bar attached to the pen or pencil-holder E, for setting the pen according to the figure required to be described. The three inventions described as above are placed with the Philosophical Instruments in the Middle Gallery (North), and towards the west end of the gallery.

JAMES WATT AND CO.'S LARGE MARINE ENGINES.

It is, indeed, gratifying to find the name of the great Watt so worthily represented by his successors, Messrs. James Watt and Co., who have contributed a pair of marine engines, of exquisite manufacture, to the mechanical section of the Great Exhibition. These engines are designed with a view to driving the screw propeller by direct action, without the intervention of gearing—certainly an immense advantage. Their collective power is equal to that of 700 horses. The general arrangement consists of four horizontal cylinders, each of 52 inches diameter, and having a stroke of 3 feet. The steamers are placed between the cylinders, with two double-acting inclined air-pumps. These engines are calculated for a propeller of 16 feet in diameter, making 65 revolutions per minute. Besides the simplicity and compactness which characterise these engines, they have the great and important advantage of occupying but little space; in addition to which, on account of their extreme height from the foundation being but small, they can be entirely protected from the effects of shot by being placed far below the level of the water-line.

THE LOCOMOTIVE ENGINE OF 1785.

Even more interesting to a majority of the visitors to the Great Exhibition than the beautiful marine engines of James Watt and Co., already described, are two models exhibited by the same firm, and side by side with the great engines: the former represents the locomotive engine of 1785; and the latter an oscillating engine, which was patented by the great Watt in 1784. Both models were made by Mr. William Murdock, the friend and assistant of the great improver of the steam-engine, in 1785. The locomotive engine on three wheels, with its cylinder and crank action, forms a wonderful contrast to the Companion leviathan engines of 1851, and which are exhibited in the railway department, within a few yards of their extraordinary ancestor. A locomotive engine of the form exhibited by Messrs. Watt and Co. was made to run on the common roads in Cornwall in 1785 and 1786.

WATT'S OSCILLATING ENGINE.

The second model is of an oscillating engine, which is exceedingly interesting at the present time, owing to the great number of machines of the same class which have been sent to the Great Exhibition.

To the unlearned in these matters, it may be as well to say that an oscillating steam-engine is one in which the cylinder vibrates on an axis, either at top or bottom if placed in a vertical plane, or at one end if placed horizontally, so as to accommodate the rectilinear action of the piston rod to the circular motion of the crank. In this model the cylinder is cased with wood, whereas in our days the jacket is most usually made of felt.

REMOND'S MACHINE FOR MAKING ENVELOPES BY STEAM POWER.

The truly ingenious machine of M. Rémond, of Birmingham, exhibited by Messrs. Waterlow and Sons, and placed near to the north-east angle of the section devoted to machinery in motion, and very near to Applegath's vertical printing machinery, by which the ILLUSTRATED LONDON NEWS is printed in the Building, differs essentially from the envelope machine exhibited by Messrs. De la Rue in the middle aisle. In Rémond's simple contrivance atmospheric pressure is employed for the purpose of raising singly each sheet of paper, and placing it on the top of the folding apparatus; and, again, in giving the necessary inclination to the flaps of the enveloped previously to their being folded down by the action of the plunger. In order to understand the process, we may suppose that several hundred pieces of paper of the required size and shape are placed in readiness on the feeding table of the machine, which, by a very simple operation is stacked by the girl in attendance on it at pleasure. The top sheet is raised from the rest by means of a contrivance called a "finger," the underside of which is perforated, and a partial vacuum being formed, each sheet is sucked up against its under surface, and transferred to the folding apparatus, on reaching which, the exhaustion being no longer maintained, the sheet drops into its place. The folding apparatus consists of an open box or frame, the size of the required envelope, over which is fixed a creaser or plunger, fitting the inside of the box by the feeding finger paper having been placed on the top of the box by the feeding finger previously described, the plunger descends just within the box, and the flaps of the envelope are thus bent to a right angle. The bottom of the creasing-frame or box is perforated to prevent any atmospheric resistance on the entrance of the paper, and the passing back of the plunger leaves the paper within the frame with its four flaps standing upright. At this point, the second application of the atmospheric action comes into play, for the purpose of giving the flaps of the envelope a preliminary inclination inwards, with a view to fit them for receiving the flat folding pressure of the return stroke of the plunger: to this end, the four sides of the folding-box are perforated, so as to allow streams of air to be forced against the outsides of the flaps of the envelopes, in order that, on the second descent of the plunger, they may all be folded down at once—the interior and under surface of the plunger being suitably formed to cause the flaps to succeed each other in their proper order. In addition to this, certain contrivances are adopted for embossing the outer flap of the envelope with any device required, and also for gumming the lowest flap, as a fastening for the completed envelope. In order to compensate for the continual decrease in the height of the pile of blank papers, and to provide for the upper one always coming in close contact with the lifting finger when the platform rises, the addition of a spring has been found to be amply effective.

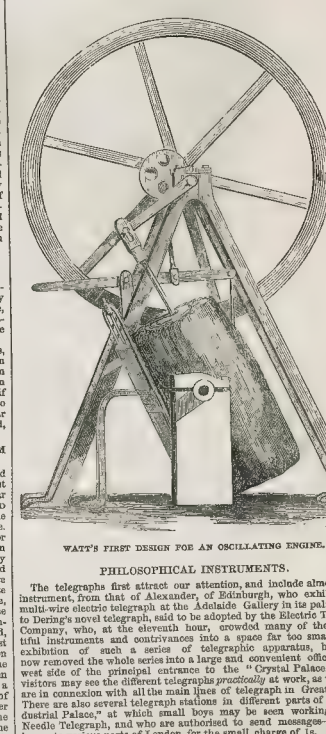
By this machine not fewer than 40 envelopes are produced in a minute, which gives as many as 24,000 per day, gummed, embossed, and entirely completed for use; if needed, the velocity might be increased. By the ordinary modes of production, the folding, gumming, and embossing are all separate processes; and as at each of these operations every single envelope must be separately handled, our readers will have a tolerable notion of the economy gained by the use of Messrs Waterlow's machine. The isolation of the different stages of manufacture consequent upon the employment of manual labour adds immensely to the cost of production, the loss mainly arising from the mere removals from one process to another. In embossing by hand, a boy will perhaps get through 8000 or 9000 per day, and then there must be an assistant to turn down the flap on which the device has been placed and arrange the envelopes in separate parcels.

It has been estimated that in the year 1843 about 320,000,000 of letters were posted in Great Britain only; and, calculating from ascertained data, we are probably not exceeding the estimate by computing the annual number at the present time at 500,000,000. But this is only one branch of the letter and parcel system; for, in addition to the distant transmission which must pass through the Post-office, the bulk of invitation cards, private notes, invoices, and accounts now involve the use of envelopes, and these do not of necessity pass through the Post-office.

Previous to the introduction of the penny postage system, envelopes were almost unheard of; for, owing to the peculiar system regulating the postage charges, all letters so enclosed were subject to a double rate as a double letter. The alteration in this respect, however, gave a powerful impulse to this mode of inclosure; and, in later years, its adoption has become almost universal.

FALLS OF NIAGARA.—MODEL EXHIBITED BY MR. CATLIN.

Among the various models which are to be found in several parts of the Great Exhibition, there is one in the American division of the eastern part of the Nave which may well attract the attention of the (at present) comparatively few visitors who are to be found in the large space allotted to the United States contributions. That one has been transferred by Mr. Catlin, from his collection of American-Indian productions, and placed on a large pedestal, in a conspicuous part of the Nave. The model, faithfully representing the "Horse-shoe" and American Falls (the former descending 150 feet, and the latter 168 feet), the various mills, hotels, residences, roads, and Goat Island, extending to 76 acres, embraces an extent of country equal to nearly a square mile; and being constructed to a scale of *90 feet to an inch*, every object is very distinctly shewn. The amount of water descending over the two falls is said to be equal to 1,715,000 tons per minute, and which is chiefly derived from the drainage of Lake Superior, Lake of the Woods, Lake Michigan, Lake Huron, Lake St. Clair, and Lake Erie.



WATT'S FIRST DESIGN FOR AN OSCILLATING ENGINE.

PHILOSOPHICAL INSTRUMENTS.

The telegraphs first attract our attention, and include almost every instrument, from that of Alexander, of Edinburgh, who exhibited his multi-wire electric telegraph at the Adelaide Gallery in its palmy days, to Dering's novel telegraph, said to be adopted by the Electric Telegraph Company, who, at the eleventh hour, crowded many of their beautiful instruments and contrivances into a space far too small for the exhibition of such a series of telegraphic apparatus, but have now removed the whole series into a large and convenient office, on the west side of the principal entrance to the "Crystal Palace," where visitors may see the different telegraphs *practically* at work, as the wires are in connexion with all the main lines of telegraph in Great Britain. There are also several telegraph stations in different parts of the "Industrial Palace," at which small boys may be seen working Cooke's Needle Telegraph, and who are authorised to send messages—not too long—to various parts of London, for the small charge of 1s.

Next in order we may mention the Messrs. Highton's instruments, which are exhibited by the British Electric Telegraph Company—a formidable rival to the old company. All Mr. Highton's improvements in telegraphic apparatus are here fully represented.

It is quite impossible, in this introduction, to do more than allude to the various beautiful telegraphs which render this compartment of the Exhibition one of the most interesting and important of any in the Building. We find, however, the instruments of C. V. Walker, the superintendent of the South-Eastern Telegraph; Henley's splendid instruments, and his immense permanent magnet; Bakewell's important writing telegraph; the American printing telegraph, exhibited by the Messrs. Brett, and Mr. A. Brett's instrument in a glass case; and, lastly, Whishaw's one-wire index telegraph, a model of his hydraulic telegraph, which was exhibited at the same time as Alexander's multi-wire electric Needle Telegraph, and who are authorised to send messages—not too long—to various parts of London, for the small charge of 1s.

Close to the telegraphs we find Messrs. Knight and Sons, and Messrs. Horne, Thornthwaite, and Wood, as the principal exhibitors—the former showing a beautiful air-pump and complete portable laboratory, and the latter displaying a galvanic battery on Smee's principle, an electro-galvanic machine for administering medical galvanism, two splendid electrotyped busts, and Rutter's electro-magnetic fire and thief detector, not to omit the most complete dissolving view apparatus which we have yet met with. We are glad to find our old friend Varley, together with his clever son, exhibiting their various improvements in microscopes, double-action air-pump, and reversing camera.

In the Western Gallery, Mr. Brooke's self-registering magnetic and meteorological instruments deserve to be mentioned, as among the most really useful and interesting objects in this part of the Building. In the same gallery, but to the north of Willis's great organ, are Newton's large celestial globe and Miss Readhouse's model of the moon, the latter having been executed by this talented and persevering lady at a cost of much time and patience, having occupied three years in completing.

To the east of the Philosophical Instruments an elevated platform or false floor is erected, for the exhibition of the pianos and other musical instruments of the principal makers in the kingdom, including the pianos of Collard, Erard, Wornum, and Mott, Robson's enharmonic, with corrections for alterations in temperature; Holdich's organ of three stops, each of six stops of the ordinary construction; Dawson's autophon, which enables the unlearned in musical manipulation to play the most difficult tunes of the best composers; a fine array of kettle-wind instruments; and last, though not least, but which is located by itself in the western gallery, the great and surprising organ of Willis, which has occupied months in its erection. The weight of this instrument is calculated at thirty tons, and the number of pipes is somewhere about 5000. Besides this gigantic instrument, Gray and Davison exhibit in the east gallery a fine organ, which added so much to the musical effects, under the direction of Sir George Smart, on the day of inauguration.

"SUSANNA."—BY A. GALLI.

SUSANNA.—BY A. GALLI.

SIGNOR GALLI is a Milanese sculptor, and he has three statues in marble in the present Exhibition; one a "Jephtha's Daughter," of which spoke favourably in our notice of the works of sculpture in the Austrian Room; another, entitled "A youth on the sea-shore;" and the third, "Susanna at the Bath," which we have engraved. The attitude and expression are well conceived, and aptly illustrate the situation of one surprised at a bath; and the general treatment is satisfactory, though the hair might have been improved, had the softness and flexibility of nature been followed, and the drapery, what little there is of it, by being lighter in material, and freer in disposition.

SKETCHES IN CEYLON.

ELEPHANT KRAAL.

ONE of the most remarkable and exciting scenes in the island of Ceylon to the European, is the capturing of wild elephants. The following is written by Mr. Nichell, the artist, who made a number of sketches on the spot, at the Kraal, which took place in August, 1847, two of which appear in our present Number:—

(To the Editor of the ILLUSTRATED LONDON NEWS.*)*

Sir,—I left Colombo on the 28th July, 1847, by the Kandy mail, to proceed as far as Ambepusse. After crossing the bridge of boats, over the Kalang Ganga, the scenery assumed a beautiful sylvan character: the road runs for a considerable distance along the opposite bank of the river, through a thick grove of suria and cocoa-nut trees, native gardens on either side, containing mango, pomegranate, plantain, custard, apple, clove, bread fruit, citron, and lime-trees, which throw a delightful shade across the road, at all times of the day, so dense is the leafing; while in the more open parts of the country, the areka-nut tree raises its graceful stems, with clusters of nuts, its deep green leaf, which resembles that of the talipot, spreading against the sunny sky. The pepper, with its red and green berries, and other creepers, with the brightest crimson, purple, blue, and yellow convolvulus-formed flowers, twine around the stems and amongst the dense foliage. Nothing can exceed the variety and beauty of these wildings of nature, or the wonderful vegetation presented to the eye in Ceylon at this season of the year. Masses of foliage cover the face of the country, bespangled with blossoms and fruit. The rest-house of Ambepusse is situated in a secluded valley, surrounded by lofty wooded mountains, and is midway between Colombo and Kandy; but the route now taken was Kornegalle, which lies in a different direction, along the banks of the Maya Oya, a clear rapid river. Kornegalle is situated at the foot of a high rocky mountain, called Aetegala, or Tusk Elephant Mountain. The last 22 miles of the road was travelled in a bullock bandy, which is a narrow cart, the sides and top covered with plaited cocoa-nut leaves, called cajan, as a protection from the burning sun. This part of the journey was tedious and tiresome, having been twelve hours and a half in searching the resting-house. The Kraal was close to the Kimboolwoona Oya, or Alligator River, 18 miles distant, where we proceeded on horseback along a bridle path. Elephant Rock was seen on the left, clothed nearly to the summit with forest trees; on the right were now and again seen, in the far distance, hills of various forms. Here we entered a dense forest; immense bare roots of areka trees had crept over the narrow path, covered with creeping plants, having great sharp, poisonous thorns. In a few miles we emerged into the open country; then again entered the forest, where not a ray of the sun could penetrate. The Kimboolwoona Oya is forty yards wide, and its bed is at this season as dry as the desert. Groups of figures were seen bivouacking in all directions, under the shade of enormous trees, dressed in many a variety of Oriental costume; others, in more exposed situations, were sitting under little sheds of talipot leaves, cooking their rice in chatties on a wood fire. The trees were festooned with the finest creeping plants the eye ever beheld, covering the entire tree like a net; jungle-rope coiled around their branches, extending from tree to tree, some resting on the ground, while the other end stretched over a branch some 70 feet overhead. In all directions around lay the skulls and other skeleton remains of the forest lord, scattered and bleached in the jungle, to tell the result of former kraals. Two miles up the river, passing a deep pool, which they say contains many alligators, you come to the ruins of a bridge, which is said to have been erected before the birth of Christ. All along the banks of the river, huge overhanging iron-wood trees were burning and smouldering away, having been set fire to in the drive, to prevent the elephants from straying up the river. Three miles down the river is another pool, where the hunters bathe the elephants, a group of which were seen cooling themselves under the shady trees, masses of grey rock rising on either side; in mid-distance tents, talipot bazaars, and groups of figures dressed in many a variety of colour; while far, far away, hundreds of human beings appeared like specks on the sunny sand of this wonderful spot, then inhabited by thousands—in a day or two the silent and secure retreat of the animals of these forest wilds, where song-birds with beautiful plumage sing their sweet notes, amid the unequalled blooming vegetation of this lovely land. The Kraal was an enclosed space of about three acres, in the Nellegelle Mookeleene forest, and is made of the stems of strong trees fixed firmly in the ground, with transverse beams, and powerful supporters tied together with stripes of bamboo cane placed two feet apart, so as to allow the mahoots, or elephant hunters, to pass out and into the enclosure. Several thousand men are employed in the drive for weeks, in the forest; fires are lighted during the night, some distance apart, forming a circle of upwards of twenty miles. The fires are placed on stands of slight construction, a small quantity of earth placed on the top, and covered over with talipot leaves, to protect them from rain; these stands are moved nearer each other, each day, as the circle narrows. Elephants have a great dread of fire: the drivers shout, beat the tom-tom (a kind of drum), and fire guns; they are thus driven forward to a confined space, little more than one mile wide, which is the entrance to the enclosure, narrowing until it terminates with the gate leading into the Kraal. Four or six tame elephants are allowed to stray about the entrance; two of the first class were called Cerebery and Wira. On the approach of the wild animals, they seem to caress them and join the herd, actually leading them into the snare. Thus, the tame elephant becomes the seducer of her brethren of the forest, and seems to delight in their capture as much as man.

We waited patiently for the entrance of the elephants into the Kraal, from one in the afternoon till half-past nine at night. It was thought that some rascality was at work to cause disappointment; when all at once the guns went bang, bang, and the voices of the drivers became louder. As the elephants approached, a shout was given by the people on the stand, but too soon, as it frightened them back, and it was thought they had escaped. The repeated firing of guns was heard once more: the noise increased, drivers shouting, tom-toms beating; then a sudden rush; when, in an instant, as if by magic, around the enclosure was one brilliant glare of light. Blue-lights, torches, and fires shed a dazzling blaze on the scene, as the maddened herd crushed and dashed through the Kraal, spreading destruction around. Huge trees were crushed to splinters and dashed to the earth; and the spot which had been a portion of dense forest and jungle,

ELEPHANT KRAAL, ISLAND OF CEYLON

appeared in a few minutes like a ploughed field, whilst their trumpeting rent the air, as they raced and tore about, round and round the inclosure, which was surrounded with blazing piles of wood, and thousands of people from all parts of the island. Eighteen elephants were captured, some of them the largest I have seen, and three very small ones.

Next morning, the tying commenced. Six tame elephants entered the inclosure, the mahoots, armed with spears, mounted on their backs: the wild ones kept in a herd, the punchies, or little ones, running under the bellies of their mothers. Often would these affectionate and noble animals, when maddened by the hunters, cover their little ones with their trunks to protect them, as they raced up and down. Now and then a charge was made: one of the herd would elevate his trunk, his tail stretched out, huge ears cocked, and race through the inclosure, bellowing most frightfully. Two of the tame ones would single him out, one at each side, while, should he prove unruly, a large tusker would follow, goading him behind: then, crushed between the two, the mahoot slipped a noose on one of his hind legs; he was thus dragged to a tree, and there tied; his three other legs were afterwards secured in like manner. So the herd were taken, one by one, until all were secured, except the three little punchies, which were allowed to go at large. It was truly a melancholy sight to see these noble animals, who had roamed these wilds, the undisputed monarchs of the forests of Ceylon, overcome, exhausted, bound captive, crying most piteously; some of them lying stretched on their side, and the little one sucking their captive mother.

At the close of the tying, the procession to the watering-place (Alligator Pool) took place; the ladies carried in palankeens, and the gentlemen walking in procession; Cereberry and Wira leading two of their captive brethren, with the hunters mounted on their backs, to water, followed by all the chiefs and herdsmen, down the Rimboolwona Oya; crowds of spectators standing under the shady trees to witness the scene.

In these regions (we have no twilight) darkness—when there is no moonlight—intense darkness, quickly comes on. It would be impossible for any description to convey an idea of the beautiful effect of the fire-fly, which is the loveliest of all insects: countless myriads of them bespangled the jungle, every tree was literally covered with them; they shone as brightly as the stars in the heavens on a clear frosty night.

I made twelve sketches of the Kraal, and rode to Kornegalle on an elephant's back, the Modliar having disappointed me in sending a horse.

This Kraal was got up in honour of Lord Torrington's arrival in Ceylon.

ANDREW NICHOLL, A.R.H.A.

THE GREAT TEMPLE OF DAMBOOL, CEYLON.

The Great Temple of Dambool, founded by King Walagam Bahoo, a century before the Christian era (like all the other rock temples in the Kandyan county), is constructed partly in a cave or hollow of a huge overhanging rock, 500 feet in height. The entrance is a noble specimen of Eastern sculpture, carved out of the face of the rock. The ceiling is gaudily ornamented with painted cloth, which has a grand and imposing effect. It contains 46 statues of Buddhu, two kings, and three gods, and measures 156 feet in length, 73 feet wide, and 24 in height. At the front, near the entrance stands a very handsome dagobah, with four sitting figures of Buddhu. The first chamber or temple of the great god is called Mahu Dayio Dewale, from the statue of Vishnu, before which trials were decided and oaths taken. This statue is one of the transformations of that god, termed Ramachandra. There is also a reclining figure of Buddhu cut out of the rock, measuring in length 50 feet. Dambool Temple is the most celebrated and magnificent in Ceylon. Its entrance, in the side of the rock, is fully 100 feet above the surrounding country, and commands a very extensive view of the vast forests, which extend as far as the eye can reach.

The accompanying Illustration was sketched from nature by Mr. Nicholl, who also has given us this account of the place.

"BACCHUS RECLINING."—BY PROFESSOR NEURINI.

BACCHUS RECLINING.—NEURINI.

THIS very spirited statue stands in one of the front bays of the Tuscan department. It is in white marble, by Professor Neurini of Florence, and as the date upon it "1850" implies, was probably executed expressly for the Great Exhibition. The god of wine, who has none of the bloated appearance attributed to him by modern conventionalism, is reclining in an easy graceful attitude, whilst he squeezes the juice from a bunch of newly plucked grapes into his mouth. The treatment and execution are of a high order of merit.

FISHING TACKLE.

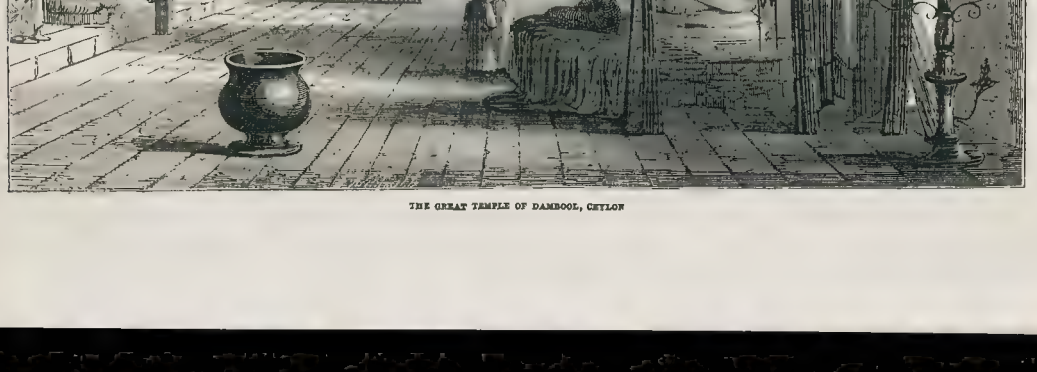
IN our article under this head we omitted to notice Mr. Banim's (Fishing Tackle maker, of Kilkenny) contribution, No. 160, Amateur Fly-anglers' Cabinet, made of Irish bog yew, which, from arrangements then going on at that part of the Exhibition, had been placed out of our sight. It is a contribution so thoroughly in accordance with several of the observations we there made, as to induce us at once to return to the subject, and do justice to one who is evidently a practical master of the craft. It is intended for the use of such anglers as prefer to follow their sport with flies of their own fabrication, and contains ten drawers and two open compartments. In the drawers are all the requisites for the amateur fly-maker, arranged in an orderly and neat manner, while the open compartments are for the reception of furs and feathers preparatory to arrangement in the drawers.

In the drawer the lowest of the first series is a book of quarto size, intitled "Book of Trout Colours." This book contains the prepared dubbing for forming the bodies—or, scientifically, the thorax and abdomen—of trout flies. The colours and dubbing so prepared are placed in the leaves of the book, according to the season the earliest being marked No. 1, and the number continuing to the end of the summer. Samples of the flies made therewith are found here.

Introductory to this "Book of Trout Colours" is an essay on the characteristics and hues of aquatic insects, in which the theory of the angler's peculiar mode of studying the river ephemera for his special purpose is laid down. The theory propounded on this interesting subject is novel, and is founded upon good data. Nor are the inductions the mere result of theory alone; for, if we are rightly informed, some forty years' experience has entitled Mr. Banim to propound his views with a more decided tone than his modesty has permitted him to use. At all events, it invites the examination of the practical angler, the more particularly as the actual manufacture of the flies in their various stages admits of the severest test. In another drawer of the cabinet is a second book—"The Book of Salmon, Lake, White Trout, and Pike Colours," with the materials of the flies, and a short essay with the rules for their fabrication.

The Cabinet appears to be, as to its contents, a theory on aquatic insects, with a practical and mechanical application—a conjunction of anglers' science, with the angler's *bonâ fide* experiments founded thereon. It will therefore be seen, that, while it possesses a large amount of interest to the fly-fisher, it affords no little instruction to the naturalist.

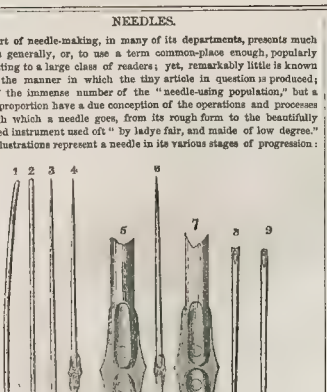
There is an angler's winch in Section 23, Mr. Higgin's case, which, from its not being mentioned in the Catalogue, escaped our observation. It certainly possesses features of novelty, inasmuch as it will permit of the angler casting his bait direct from the winch, without any check from the cogs of the wheel. This, indeed, would be a great advantage, were it not attended with very awkward drawbacks. It is true, that, if the winch be left wholly unchecked, the line may be thrown to a considerable distance without the necessity of first laying the line in coils at the feet of the angler, as is now the case, and which necessity too often involves the line in considerable entanglements from stubble or briars; but, on the other hand, a strong cast from the winch itself is as certain in one trial out of three to meet with a recoil at the termination of the throw, which winds the line partly back again upon the winch and creates snarles of the most vexatious kind. Our readers are mayhap acquainted with the toy known as the bandeleur, which is suspended by a string wound around it, and being dropped from the hand (the end of the string being retained), descends some distance down, and, by its own rotary motion thus acquired, winds itself up again in a contrary direction. Much after this fashion is the principle of this winch; and the consequences are, to a certain extent, alike. We know this to be the effect even with the common winch, notwithstanding the friction of the cog-wheel. But what does a good angler want with anything of the kind? the supply by the hand is always sufficient when the fish has taken a trolling bait. It appears to us, that the object sought to be achieved by many of these so-called inventions is, to reduce angling, as far as possible, from an art or science to a mere hank runner existence; not that we at all object to any really useful appliance that shall abridge the labour incident to the pursuit of the gentle craft.



THE GREAT TEMPLE OF DAMBOOL, CEYLON

NEEDLES.

THE art of needle-making, in many of its departments, presents much that is generally, or, to use a term common-place enough, popularly interesting to a large class of readers; yet, remarkably little is known as to the manner in which the tiny article in question is produced; and of the immense number of the "needle-using population," but a small proportion have a due conception of the operations and processes through which a needle goes, from its rough form to the beautifully polished instrument used oft " by ladye fair, and maide of low degree." Our illustrations represent a needle in its various stages of progression:



in noticing these, we shall attempt to describe the nature of the operations, in detail, as fully as the very limited space at our disposal will admit of. Brief as this must necessarily be, we trust that it may be worthy of a small corner—in keeping with the tiny article of which it treats—in the boudoir of the lady, or the little wall-nook or humble book-shelf of the peasant girl's home.

Plied in the busy hands of thousands, the little needle in our social and domestic circle plays an important part. Now, vieing in lustre with the sparkling gems on the fair hands of the high born damsel, the little glistening instrument assists in weaving on the canvass the bright colours which serve to deck the stately mansion; now assisting in the more useful, if not so elegant a purpose of ministering to wants, not luxuries; anon in cozy rooms, the curtains drawn, the bright fire blazing cheerily,

> The needle plies its busy task,
> ——The threaded steel
> Flies swiftly.

And thus, in hall and bower, and every room of the "snug citizen," the needle plays its part. But not alone in these, alas! does the instrument perform its work; could dead walls speak, and cheerless rooms tell tales, how piteous would the recital be! "In garrets cold and mean," how weary are the lives of those who ply "the needle and thread." Truly, if there is not a wrong but what is sure to bring down its punishment, the misery, the sickening influence of hope deferred endured the dragging out of a mere existence, a living death, on the part of those poor creatures—is recorded in Heaven's chancery, in all its piteous hideousness, as evidence against us as a nation. Glad are we that the day has come when noble attempts to rescue our seamptresses from their fearful position are becoming matters of daily recurrence; and assuredly we deem it no small privilege here to advocate, though in truth but slightly, their claims to the consideration of our readers. May those of our fair readers who have the will and power, use their best endeavours to ease aching hearts—to make the needle, the companion of their happy homes, in wasted and wearied hands to ply its task more cheerily.

Lost, broken, disabled, lent, borrowed, found here and there and everywhere—where do all the needles go to? The question has been often asked in connexion with the fate of the missing ones of its kindred or sister article, pin, but with no decisive answer as yet, so far as we know, being obtained. And such is likely to be the fate of our question. Although there may be more interesting matter in the philosophy of the question than we wot of, we leave its consideration for that of one of more immediate interest—"Where do all the needles come from, and how are they made?"

It would have been interesting at this point to have traced the history of the art of needle-making. This, unfortunately, we cannot do to any great extent. The materials to assist us in such an inquiry are amazingly scanty; and, although we have "searched and better searched," to use the quaint language of the nursery story, all sorts of books, from the thin and lanky pamphlet to the ponderous encyclopædia, all the information we have been able to hunt up on the subject is the meagre yet sufficiently interesting fact, to not hypercritical minds, that "Needles were first introduced into England in 1540, in the reign of Elizabeth, by a native of India;" so that it appears, that, amongst other things, we are indebted for the needle to the "glorious reign of good Queen Bess." The above important fact seems to be a stereotyped one, as every writer ventures it; but the flow of the historical lore is soon stopped for want of material, and to "close the period up," a little bit of traditionary matter is added, to impart to the whole recital something like the dignity of historical research. The tradition is this:—That the above-mentioned native of India lived, or died, the manufacture also died with him, but that, tradition sayeth not how, it was revived by one Stephen Green, in 1560, who was settled with his three children—mark the historical circumstantiality of the details—Elizabeth, John, and Thomas, by Mr. Damon, ancestor of the Lord Milton, at Long Crendon, in Bucks, where the manufacture has been carried on from that time to this present day. As to the truth of this tradition we cannot positively say; but it certainly is the fact, that for many years the manufacture has been carried on solely at Redditch, in Worcestershire; and to no extent worth noticing in any other place, city, or town in the kingdom, with the exception of a factory in Bucks, where needles are made called "sail," not the beautifully polished, the gently-tapered and smooth-eyed article that ladies use.

Needles, as all our readers are aware, are made of steel, the steel being made into thin wire, of a diameter proportionate to the fineness of the needles to be made. As the wire is brought to the factory in circular bundles, the first operation is untying them and cutting the wire into certain determinate lengths. A pair of shears, of rather large dimensions, are fixed to the wall of the cutting shop, having the blades uppermost; one limb is fastened, the other is loose. The workman is provided with a gauge by which the length of the wire to be cut off is measured. Uncoiling the bundle of wire, he puts the wire into the guage, and placing the series of wires forming the thickness of the coil between the blades of the shears, he presses against the loose limb with his thigh, and, by moving the coil up and down to assist the cutting action, he speedily severs the lengths from the coil. Proceeding thus, he cuts off a series of lengths till the coil is exhausted: out of one coil he may thus obtain as many as 40,000 distinct wires. The coil being circular, it is evident that each individual wire must partake somewhat of its curvilinear shape; in fact each is far from being straight. Fig. 1 is a *fac-simile* of the wire at this stage. As one of the requisites of a needle is that it shall be straight, the next process is to straighten all the wires. Supposing two of the curved wires in Fig. 1 to be placed in the palm of one hand, and rubbed quickly, backwards and forwards, by the fingers of the other, a slight straightening would ensue; but, if the needles were removed to a hard flat surface, as a table, the operation would be much facilitated. If, however, a dozen or two of wires were to be placed on the table, and so kept as to lie close to one another, and then rubbed, the pieces, rolling one upon another, would soon be straightened, as the hand part of one would roll upon the flat part of another, and thus, by the continuance of the process, the whole wires would be straightened. This is, in fact, the *rationale* of the process carried on at this stage of the manufacture. Two rings of iron are provided—one 3 inches in diameter, ¾ inch broad, and thes ame thick; these are placed a distance apart on a flat stone slab some 18 or 20 inches from the ground. The distance between the rings is such, that, when the wires are placed within them, the ends are flush or even with the outer surfaces. Supposing a number of wires are placed thus, sufficient to fill the interior of the rings one-half of their diameter or so; the whole are fastened tightly in, and placed in a furnace and heated to a red heat. They are then taken out, placed on the slab, and the fastening removed, so that all the wires are free to move one upon another. The workman then takes a piece of curved iron, some inch-and-a-half broad and half-inch thick: he places the curved or convex side of this on the top row of wires between the rings, and, pressing forcibly by means of his hands at either end of the iron, work s the rings briskly backwards and forwards on the slab. By this means the wires are kept rolling upon each other, and continually shifting their places, thus presenting a new portion of their surfaces to the action of their neighbours. The shifting of the wires may easily be ascertained by inserting a piece of cold wire, which, being black, is easily observable among its red neighbours. Near the bottom of the ring, in a few seconds it will be seen at the top, its course being distinctly traced, winding its eccentric way amongst the others. When cold, the wires are all straight, as shewn in Fig. 2. The next operation is the pointing. In order to save time, each wire is long enough to form two needles; each is therefore pointed at both ends, as seen in Fig. 3. The grindstones by which the wires are pointed are of small diameter, not more than 10 or 12 inches, but they revolve at an immense velocity, the moving power being generally water-wheels. Each grinder sits on a low stool, in front of the grindstone, a small trough of water being placed before him. Taking up 60 or 100 needles, according to their quality, he places them on the palm of the right hand, so that the ends project over the length of the forefinger. Next placing the left-hand fingers on those, the thumb grasping the back of the right, he is enabled so to move the whole range of wires that they may present each one their ends, and yet without rolling over one another. He then applies the points of the wires to the rapidly revolving grindstone: if he held them always in one direction, the action of the stone would be such, that the points would be bevilled off like cutting by the fingers he makes them all to revolve, thus giving to each a gently tapering and perfectly round point. As the wires are apt to project unequally over the finger, thus presenting one wire longer than another to the grindstone, the workman every now and then strikes the points gently against an upright flat-faced piece of timber, somewhat in the same manner as a person shuffling a pack of cards makes them all even by knocking their ends upon the table. On the wires becoming red-hot, the workman dips them into the trough of water placed before him. A brilliant stream of fiery sparks is continually passing from the points. The matter thus evolved being inhaled into the lungs of the workmen, formerly rendered them a peculiarly short-lived race. The deleterious products are now, however, by the use of a powerful fan, drawn away from the scene of respiration as soon as they are produced. The trade is now as healthy as any other. The operation of grinding is exceedingly interesting, and presents an exemplification of the dexterity attainable by long practice in any one branch; but this remark is equally applicable to many other departments in the manufacture of needles. A good workman can point upwards of 10,000 in an hour. It is amusing to see the rapidity with which he will take up a handful of wires, point an end of them all, and turning them so as to present the other ends to the stone, lay them aside perfectly pointed at both ends.

The wires thus pointed are next taken to the "stamping shop," and here the wire first gains its approach to a needle. Such needle is to be rounded at the head, and have a hole made there, called the eye, as also an indented chalet on either side of the latter of the round head; the stamping makes the round form, and marks the place of the eye-hole. A wooden-framed stand, or table, is provided, with a massive anvil, on the upper surface of which is placed a die or design in relief, as shown in Fig. 4, a wooden mallet or hammer suspended by a rope over a pulley placed above the table, and plays between two vertical guides; the same design as in the die is made on the lower surface of the weight, but in relief, or protruding from the surface. The lower end of the hammer or weight is slightly bevelled with a stirrup, in which the workman can place his foot. Standing before the table, he takes a number of needles in his left hand, and with his right places each wire exactly in its centre on the lower anvil or die, and letting the weight fall suddenly by pressing on the stirrup, a wire is impressed on the centre of the wire, on both sides, as seen in fig. 4. Fig 5 is an enlarged view of the centre part of the wire. The round circles are the places through which the eye-holes are to be punched, they are very slightly indented at this stage, merely enough to denote their situation. Releasing his foot, the workman lifts the weight, and places another wire on the die, allowing the weight to drop suddenly, as before: the impression is made, and the wire cast aside, to be replaced by another, and so on. So rapidly is the process gone through, that it is actually inducive of a painful perception. The workman takes each wire from his left hand, places it upon the die, withdraws it, and throws it aside to take up another, so very quickly, that a quick-eyed witness of the operation actually believes that it is but one and the same needle that the operator is throwing out and in. Considerable rapidity is required in the stamping, as each wire is to be placed so that it will be struck exactly on the centre; the chief guide to aid him is the eye; and so rapidly does he become aware of its being wrong placed, that he arrests the fall of the weight, and replaces the wire in its proper place: indeed, the facility with which he can do this by the immediate action of the foot is not the least remarkable matter observable in this department.

The eye-holes are next to be punched. This operation is generally performed by little boys. A punch similar to that used for the eye process. The lower end of the punch is provided with two projecting points placed at a distance from each other, exactly equal to that between the indentation formed in the wire, through which the eyeholes are to be made. The little operator, taking a number of the stamped wires, spreads them out like a fan, and placing each one on the centre of a small slab, brings down the upper slab, which makes the holes in the wire forming the eyes. This is a very nice operation, as the slightest misplacement of the wires, so that the centres were not in the points, would involve the spoiling of each, from the punches passing through wrong places. To guide the operative, a small indentation is placed in the lower slab, or bed; into this the wire is placed: by means of this, a delicacy of touch, and a quickness of the eyesight, almost every wire is placed on the slab, and properly punched in one direction.

Each of the wires has two moulded parts, gutters, and eye-holes in the centre; the next operation is the dividing of these so as to form two needles. Figures 6 and 7 show the needle in this stage previous to the dividing. Figure 7 is an enlarged view of the centre of fig. 6. The first step in dividing the wires is what is termed "spitting," that is, passing a fine steel wire through the eyes of perhaps a hundred wires, as there are two eyes there are also two wires; when they are all thus spitted, by bending them backwards and forwards between the hands, they are broken in the centre, one-half remaining on each wire. Before dividing them, however, the protuberances on either side, as seen in figures 4, 5, 6 and 7, are filed off, by placing the wires (spitted) on a convex block, keeping them tight through by means of a leather band, while the workman uses a smooth file. When broken, each needle has a square head as in fig. 8. It is nicely moulded by means of a very small grindstone, as seen in fig. 9.

We have thus far traced our piece of wire to a very respectable-looking needle; but, much as it would be prized by a savage, it is by no means fit for use in civilised countries; to make it so, it has to undergo many processes: these we shall attempt to describe very briefly. The needle, at the stage we have arrived at, is as soft that it can be bent between the fingers as easily as a piece of lead of the same diameter. They therefore require to be hardened. Previous to the hardening, the "soft-straightening" is to be gone through. This operation is meant to restore the straightness of each needle, lost by the repeated processes which it has gone through, as "pointing," "stamping," &c. The "soft-straightening" is simple. The operative sits at a bench having a flat surface. Placing the needles parallel to one another on this, he presses a convex piece of iron on each of the needles, rolling it over and over, until it is straightened. So quickly is the operation effected, that a good workman may straighten upwards of three thousand needles in an hour. The straightened needles are then hardened by being heated to redness in an oven or furnace, and suddenly plunged into cold water or oil. This makes them so brittle that they can be broken as easily as glass. They require, therefore, to be "tempered." This is effected by placing them on a hot plate, and moving them about so as to present each needle in succession to the action of the plate. As soon as they have all acquired a particular colour, they are removed. When cold, they are then beautifully elastic. As they are, however, slightly distorted by the action of the heat, each needle is straightened by giving it a tiny blow with a tiny hammer on a small steel anvil. This process is necessarily tedious. It is called the "hard-straightening."

The needles, though now properly tempered, are still rough and unpolished on their surface: to obviate this, and make them bright, is the next of the series of operations. The process is termed the "scouring." A strip of canvass is laid on the table, and an immense number of needles are placed on this, all parallel to one another: a pretty large allowance of soft soap, sweet oil, and powdered stone found in the neighbourhood of Redditch, is then placed over them, and the whole tightly wrapped and corded up into a shape as seen in figure 10. A considerable number of these bundles being prepared, they are placed beneath a moving table of wood, working to and fro in a wooden bed. The needles by this means are rubbed one against another, until, in process of time, they are smoothed and partly polished on their surface. After being subjected to the action of this machine, the rolls are untied, and the needles washed; they are then replaced in the canvass, and tied up with a fresh supply of soft soap, oil, and emery, and subjected to the action of the scouring machine. This is repeated several times, till they are perfectly smooth. After being washed for the last time, the needles are placed among some dry sawdust, and worked to and fro in a peculiarly-shaped copper tray till they are all perfectly dry. At this stage a very curious operation is observable: the needles being mixed up with the saw-dust, it becomes a matter of importance to separate them with rapidity: this is effected in a manner as simple as it is effectual. The tray in which the needles and saw-dust are placed tapers up to an edge, which has no margin, thus affording a place over which matters can pass without obstruction. The workman moving the tray rather rapidly up and down, causes the needles and saw-dust to approach the edge: the saw-dust being lightest, flies off, the needles remain; but such is the dexterity of the workman, that, although the needles are seen glancing half over the edge, still it is an exceedingly rare occurrence for one to pass completely over: thus in less time than we have taken to write the above half-dozen lines, the workman can separate thousands of needles from their attendant sawdust. As may be supposed, the needles from this rough proceeding are lying in all imaginable positions. To make them parallel to one another is the next operation. This is easily effected by placing them in an oblong tin tray, and giving it a peculiar shake in a remarkably short space of time some thousands are parallelised. But, although they are parallel to one another, still they are wrongly situated for subsequent operations—the head of one may be next to the point of another; it is necessary that t e heads of all should lie one way, the points another. To attempt to do this by singling out each individual needle, would be a hopeless task where millions have to be operated upon. By a very simple contrivance—we may say machine, for it saves labour—the operation is effected most rapidly. A small piece of linen rag is wrapped round the forefinger of the operative, and, placing a few thousands of the parallelised needles before her on the table, she passes the covered finger along one side of the heap, the finger of the other hand on the other side; the needles having their points at one side stick into the linen rag; these are placed by themselves. In this way all the needles with their heads lying one way are left by themselves.

The next operation is "drilling" the eyes. From the nature of the operation of "punching," the holes are rather rough and uneven: it is to remove this, and to countersink the holes, so that the sharp edges may be taken off, that the operation of drilling is gone through. As the needles by this time are very small, they have to be softened by the application of heat, so that the drill may not be spoiled by the hard metal. For this purpose a number of needles are placed on a bar of iron, with their heads projecting over the edge a short distance: these are then applied to a red-hot bar, which reduces the temper of the needles, causing the head to assume a beautifully blue colour: this process is called the "blueing." A number of the blued needles are next taken by the driller—generally a little girl—and placed behind a flat steel bar, with their heads projecting slightly above its upper edge. The operative sits exactly in front of a little drilling-lathe, in which a small drill is placed, and made to revolve rapidly. The needles are brought one by one before the point of the drill: the drill not only cleans out the eye, making it internally smooth, but it also countersinks the outer edge of each. Some idea of the extreme nicety of the operation may be obtained, when it is remembered that the variaton of a hair's breadth in the presenting of the eye of the needle to the point of the drill would result in the complete spoiling of the article; yet such is the amazing rapidity with which the drilling proceeds, that a dozen will be drilled in as many seconds: in fact, it is difficult to believe on first witnessing the operation, that the needles are really drilled.

The needles are then taken to the polishing-room, where they are beautifully polished by being held to the periphery of revolving wheels, covered with buff leather. The needles are taken up in a dozen or so at a time, and first held by the points and the upper ends, then by the heads and the pointed ends: the whole surface of each needle is thus rapidly polished. They are then counted and put up in little blue papers, twenty-five in each, labelled, and tied up in bundles for sale. We have thus briefly traced the manufacture of a needle from its rough state to its final condition. As an instance of the many processes through which a needle of the best quality goes, we here append a list of them

Number of processes through which a best needle goes from the commencement of its manufacture.

1. wire received; 2. weighed; 3. gauged; 4. cut; 5. rubbed; 6. counted; 7. pointed at first end; 8. washed; 9. cut back; 10. pointed at last end; 11. examined; 12. counted; 13. washed; 14 weighed; 15. annealed; 16. stamped; 17. pressed up; spitted; 18. filed; 20. broken; 21. heads filed; 22. oil burnt off; 23. soft-straightened; 24. evened; 25. counted; 26. hardened; 27. evened; 28. strapped; 29. tempered; 30. weighed; 31. examined; 32. picked for crooks; 33. hardstraightened; 34 counted; 35. scoured with 7 coarse; washed and evened between each; 36. washed and dried; 37; weighed; 39. evened; 39. headed; 40. weighed; 41. ground (*at points*); 42. weighed; 43. scoured again with 1 more emery, and glazed; 44. weighed; 45. washed and dried; 46. weighed; 47. evened; 48. headed; 49. picked for waste and broken points, flocked, and crooked; 50. weighed by count; 51. set; 52. examined; 53. weighed for drillers; 54. blued; 55. drilled; 56. rubbed; 57. weighed from drilling; 58. examined; 59. rounded by finishing; 60. finished once; 61. rubbed; 62. finished again; 63. rubbed; 64. examined; 65. weighed; 66. papered; 67. labelled; 68. tied up; 69. collected; 70. packed up.

FREEMAN ROE AND HANSON'S FOUNTAIN AND HYDRAULIC RAM.

There are many interesting and elegant objects which "lend enchantment to the view," within the Crystal Palace, and none more so than the various beautiful fountains which we discover in different parts of the nave and transept. While Osler's exquisitely finished crystal fountain—occupying the very central spot of the transept—takes the lead in these elegant appendages to the conservatory fountain of Messrs. Roe and Hanson, with its seventeen jets, which may be varied at pleasure, gives a charm to the spot which it occupies, on the north of the site of the Royal dais, which will be, if possible, more eagerly sought after in the hot days which we may hope to experience in the coming month.

This fountain, with the rim of the large basin, is of iron; the basin being 18 feet in diameter. Three other basins are seen rising one above another, the whole being surmounted by the stand pipe, which is furnished with several jets, as the dome, the centre cupola, wheatsheaf, &c. Of the central jets, the lower one is 4 feet 10 inches in diameter, and the upper one 12 inches.

In the large basin is the model of a *Victoria regia* lily, made to the scale of 1½ inch to the foot, having the leaves, flowers, and buds complete; on one of the leaves sits the model of a boy holding a flag in his right hand, with "God save the Queen" inscribed thereon. In the full-blown flowers water gushes out to form the petals; and around the large ground basin are seventeen variable jets, which render this one of the most interesting objects visible in the transept.

The waste water from this fountain is made use of for the purpose of driving an improved hydraulic ram, exhibited by the same firm, a little to the south of their large basin. It has a fall of 90 inches, and throws up water to the height of about 16 feet—the action of the ram being visible to spectators. In mountain districts especially, these rams may be advantageously introduced for raising water for the supply of houses, for the irrigation of lands inconveniently situated as regards water, and for many other purposes where it is desirable to dispense with additional labour.

THE EXPOSITION OF 1851, &c. By CHARLES BABBAGE, Esq. 8vo Pp. 231. Murray.

This is a work illustrative of the unparalelled Exhibition, and its unparalelled Crystal Palace repository, and treats not only the immediate subject comprehensively and scientifically, but also discusses, in no forbearing temper, the conduct of Government and the evils of party in other respects. The fame of Mr. Babbage, as a transcendent mathematician, is too well known to need "exposition" (as he prefers to use that French word instead of the usual English "Exhibition"); and his unfortunate differences with Government concerning his calculating machines, and disputes with several of his compeers in the pursuit of science, are also too familiar to the public to justify more than a passing reference to them. Suffice it, therefore, to say, that his introductory diatribe, generally, upon English management (Pref. vi. vii.); apology for personalities (viii.); political censures (ix. x. xi.), and elsewhere; statement of the ministerial neglect of his extraordinary analytical inventions; declamation against the Royal Society, the Astronomer Royal, and the Rev. Mr. Sheepshanks; eulogium upon Sir James South; argument in favour of entirely secular education; essay on the press; and stringent remarks on the abuse of titular honours and pecuniary rewards where but poorly deserved, while science was discouraged and its chief ornaments were almost despised, though mostly topics of much public interest, may be dismissed with bare enumeration in a notice which we would rather confine to the direct illustration of the actual Exhibition and its prospective results.

The philosophical mind and great intelligence of the writer are displayed, for our purpose, much more satisfactorily in his views of the principles of exchange, and of the rules by which judges and jurors ought to be guided; and his statistical facts and reasoning upon them, and their presence or absence in as far as the conduct of the Exhibition has been carried, and its future management and effects, are implicated. The grand principle enunciated upon the inquiry into the interchange of commodities, and the errors which have heretofore beset that difficult question, is, that *"the free and unlimited exchange of commodities between nations contributes to the advantage and the wealth of each."* Hence benefit arises from no sacrifice of one nation for the profit of another; and that the germ of the productive powers of man is by these means, without any increased labour, largely augmented throughout the world; that this increment is won partly by the suppression of ignorance and fraud, and partly by the united effects of industry, of skill, and of science, in compelling Nature to minister to the wants of man."

The tendency of the World's Fair to extend and cultivate these principles and relations is, consequently, highly applauded by Mr. Babbage; but he disapproves of some of the measures adopted for establishing them, and especially the rejection by the Commissioners of the proposal to mark the prices of the articles exhibited, which he considers to be the leading fault in the whole scheme. Upon this most practical point he observes:—

This consequence of the absence of price is injurious both to art and to artists: it occasionally removes from the field of competition the best judges of real merit. It is true that in several professions a certain delicacy respecting money matters exists which is wanting in others. Medical men and artists are peculiarly subject to its influence; but it is not reported of any lawyer that he ever refused a fee; and it is recorded of some Secretary of the Admiralty, that he claimed *a quarter's pay for every new salary*, on account of his right of interception of peace by the combat of Algiers.

§ Another result of prices not being marked upon objects is, that the public are unable to form any just estimate of their commercial value, consequently no proper public opinion arises to assist the juries in their decisions. This is a matter of considerable importance: the duty of a juror at an exposition is quite different from that of a juror in a legal question. It is the business of the industrial juror to avail himself of the knowledge and the observations of all around him. Much of what he thus hears he may be able himself to verify by examination or experiment, but public opinion will be more matured, and the decisions of the juries have greater weight.

§ Many of the qualities of the articles exhibited can only be ascertained by use, or even by their destruction. In such cases a single sample would often be purchased if it had its price affixed to it.

Another class, small indeed in number, but important from its functions, suffers the greatest inconvenience from the absence of price. These are those employed in studying the commercial and economical relations of various manufactures, either for the gratification of their own tastes or for the instruction of the public, are deprived of the most important element of their researches.

If *every article* had its price affixed, many relations would strike the eye of an experienced observer which might lead him to further inquiries, and probably to the most valuable results. It is not to be supposed that he could, or would, in considerable portion of 15,000 expositors for their list of prices, or even to go round and ask for it in the Building itself. Price in many cases offers at once a verification of the truth of the description. Those who have had to contend with the subjects, the low *price* of an article might prove that it had been manufactured in some mode entirely different from that usually practised. This would lead to the examination of the article, and the discovery of its peculiarities. The *price* of an article compared with its weight might prove that the metal of which it is made *could not* be genuine. The *price* of a woven fabric, added to a knowledge of its breadth and weight, would frequently, in the hands of skilful men, effectually disprove the statement of its being entirely made of wool, or hair, or flax, or silk, as the case might be.

The exchange of commodities between those to whom such exchanges may be desirable, during the great and ultimate object of the Exposition, every circumstance that can give publicity to the things exhibited should be most carefully attended to. The price in money is the *most unprejudiced* in every bargain; to credit it, is not absurd that it is frequently adopted without its hero, it would paint a portrait without a nose.

It commits a double error; for it withholds the only test by which the comparative value of things can be known, and it puts aside the greatest of all interests, that of the consumer, in order to favour a small and particular class—the middle-men.

The condition of that commission must be most extraordinary, where an error so contrary to the principles and so fatal to the objects of the Exposition, could have been committed. It is not too late to apply at least a partial remedy to the evil, and it is scarcely credible that those with whom it rests can remain unconscious of the mistake into which they have been led.

The style and feelings of the author may be gathered from this extract, as well as his cosmopolitan manner of looking round upon the collateral topics that are linked, however slightly, with his main argument, which, in this case, is to show, that, by their rules on this matter, the Commissioners "violate the very foundations of those principles on which the whole advantage of the Exposition rests."

Leaving this topic, *i. e.* of the utility, yet largely practicable, of affixing prices and even of facilitating sales, which is also recommended, we can only refer the 15,000 parties most interested in the adjudication of the prizes still retained to the Chapter on Juries, which is full of sound sense and instruction

A clear statement of the principles on which each jury is to award prizes should be placed before them. These principles ought to be well discussed, and in that discussion manufacturers should be invited to take a part.

The first object of the jury should be to lay down rules by which these principles are to be carried out. Each class of the subjects to be rewarded will have its own rules. They will generally be few in number, and capable of being expressed in few words: some of these are suggested below, but merely by way of example

One of the most general rules will indicate the means by which the jury can ascertain the fact, that the material of the manufacture under consideration is truly the substance it is represented to be. For instance, some woven fabric is examined, professing to be made either entirely of wool or wholly of flax. It may be quite true that experienced manufacturers and dealers are able to detect any adulteration of either material by admixture with the other. But statements of facts made on authority, never possess the same weight with the public as those which are accompanied by information enabling any individual among that public to verify the fact for himself. The power of the microscope in this microscope is one test. A more simple one is to burn some fibres in the flame of a candle. Every fibre which, when thus treated, produces the smell of burnt feathers, is animal matter of some kind, as wool, silk, horse hair, &c. The burnt fibres of hemp, flax, cotton, and other vegetable matters, have a totally different scent; a fact of which any one may readily assure himself by making the experiment. It may, perhaps, be necessary in some cases to wash the fabric under examination, lest, in what is termed the "getting up for the market," some animal matter or size might mislead. But the jury ought to be acquainted with all such difficulties, and they should state the method they took for investigating them.

The microscope is of great use in the detection of adulterations in most vegetable substances.

Every object produced is subject to certain defects, and possessed of certain excellences: these should be clearly enumerated. Whenever such state nents are expressed by numbers, the information will be more satisfactory. Thus, in cutting tools, as applied to various metals, it is very important that the angle at which the tool is applied should be stated: it is also necessary to state the angle which the edge of the tool receiving the shaving will make with the surface cut. The velocity of the tool in cutting should be stated, also the names of the fluids, if any, used in cutting.

The durability of woven fabrics, as well as of a great variety of other manufactured articles, is a most essential quality, on which, combined with the price, their chief value to the customer depends. It is very desirable that the jury should find satisfactory means of testing this most important character, which is not discernible even by the most curious and instructed spectator.

The knowledge of the weight required for tearing asunder any woven fabric, as a ribbon, a stay-lace, tape, &c., together with the breaking weight of their individual threads, and the number of these threads in an inch, may in some cases be very valuable, especially in coarse articles, such as sail-cloth, sacking, &c. In other cases, the articles may be submitted to twenty or thirty washings and dryings, during which it may repeatedly be examined, and the greatest change will most frequently occur on the first washing, which removes the dressing.

In many articles the durability of different parts varies considerably. In some cases one part will wear out, if replaced, many times before the remainder of the article is at all injured by use. In all such cases the jury should adopt such rules as the following:—Examine the durability of each part, and also the difficulty and the expense of replacing it when injured. Examine, also, for the same purpose, what parts are most exposed to injury or destruction by accident. Examine, also, the relative expense of renewing the articles in a worn state when first purchased and brought home. These rules will be best understood by an illustration. Let us suppose a jury to be examining the relative merits of several cottage stoves for cooking. Of course, the first inquiry will be as to which admits of the best performance of the operations of boiling, stewing, roasting, broiling, baking, supply of hot water, ironing, &c. The cost of the fuel must not only be given, but also its weight, because the price of fuel varies in different localities. The capability of using different sorts of fuel in the several stoves, and the amount of fuel so consumed for its equivalent of coal, should also be stated. These and other comparative inquiries having been made, the stability of that part of the stove which is subjected to the direct action of the burning fuel must be examined. It will be made either of iron or of earthenware; and the relative merit of the various stoves will, at this point in succession, be considered, consist in the facility and economy with which such parts can be removed, and the corresponding new parts be purchased and replaced in their proper position. It is always desirable for the consumer, that the number of such articles which form a stock of the parts liable to wear out, and that the latter should undertake to replace them at a fixed price. Those parts of the stove which project so as to be liable to accidental blows, and those which are from their more constant use most exposed to accident, as the hinges and the latches of doors, should then be examined. These, if of cast iron or other brittle material, and constituting part of the substance of the door, should be sufficiently strong to resist fracture: if they are attached to it by rivets or otherwise, they will be lighter and stronger when made of wrought iron. The last inquiry is into the expense of fixing the stove for use, as may be set in brick-work, within the chimney, in which case it will require a bricklayer and a large mass of materials in the shape of bricks and mortar, and possibly of stone. Or it may stand on its own base containing its own ash-pit, and be fixed in a small iron pipe the area of the actual core of the flue. In this case almost any workman with hammer and chisel and a small quantity of mortar or cement can fix it ready for use. Again, the stop-cock for the water sistern may be either hard-soldered, riveted, or screwed in. If the latter, it can easily be unscrewed or re-ground when necessary. The same remark applies to the leaden supply-pipe; it may be connected by soldering, or by a union joint. In the former case these parts will require the aid not only of the tinman or coppersmith, but also of the plumber.

The expense of repairing a machine does not in all cases depend on the cost of the part replaced, or even on the actual cost of fixing that part in its place. It often happened in the earlier days of locomotive engines, that the expense of some small reparation necessary to keep the machine in good work ng order did not amount to ten shillings; whilst the expense of removing and replacing other parts, without which the workman could not get at the defect ve part, amounted to fifty or eighty shillings, or even to a still larger sum. Thus, facility of getting at all the parts of an engine for the purpose of repair, or even of examination is one of the advantages which the broad possesses over the narrow gauge.

In many articles exposed to great or sudden force, and to much wear or tear, it is very desirable, that, if breakage should occur, it should happen at that point where the consequences would be the least dangerous to the persons using it, and the reparation of it least expensive.

During a series of experiments made by the author, in 1839, on the Great Western Railway, it was necessary, amongst a variety of other curves, to cause a pen to draw upon long rolls of paper the curve described by the centre of a carriage, projected on the plane of the road. When everything is in proper order, this line ought to be parallel to, and in the middle between, the two rails. But it is well known, that, instead of answering these conditions, it often describes a serpentine curve, arising from that snake-like motion of a train which the carriages acquire by rolling alternately from one rail to the other, increased or checked by the flanges pressing against it. To accomplish the drawing of the line above mentioned, it was necessary to have depending from the carriage a very stout jointed wooden arm, terminating in an iron shoe with a steel projection. This shoe was, by a powerful spring, pressed close to the rail in the middle point between the two side-wheels of the carriage, and by a communication with the pen the required curve was described. But when an apparatus was exposed to very rough work, and, in fact, was generally broken three or four times during each experimental journey. If the broken part had fallen between the wheels of the rail, it might have caused a serious accident. To prevent this the following precautions were taken:—The wooden arm was strengthened with thin strips of iron, except at one part about an inch long. At this part a small notch was made in the arm, and a short portion had a strong iron eye fixed into it, which was connected loosely to a hook by a rope passing through a hole in the middle of the carriage. Whenever the apparatus broke, it was easy to see where it might have taken place, the loose rope holding the broken part was such, that the tendency was immediately to drag it into the middle of the road, under the centre of the carriage. This at once removed it from interference with the rails. The part which caused the curve soon gave notice, by ceasing to move laterally, that the arm was broken; on which one of the assistants immediately took hold of the loose rope, and pulling the broken fragment close up to the bottom of the carriage, prevented the possibility of any further danger.

If each jury were to explain concisely the means employed by them to examine the qualities of each class of object over which they had to preside, and to which information would result. A collection of these rules for the judgment or verification of articles, if reduced into order, and published in a small compass, by a competent person, at the close of the Exhibition, would be invaluable to the public. The result would be beneficial to all *honest* tradesman, and injurious only to the *fraudulent*. Such means, when put into the hands of the public, would soon enable it to distinguish the genuine from the counterfeit article, and to select those which in point of excellence and durability are best suited to the means or wants of the purchaser. The increased knowledge of the public would be felt by the retail dealers, and would enable them more anxious to obtain excellent and durable goods from the manufacturer.

Several of the papers issued by the Commission bear honourable testimony to the sagacity of those who composed them. The circulars addressed as reasoning men, explaining to them the results contemplated; the "Notice to Jurors," and the "Instructions for the guidance of Exhibitors," are excellent of their kind. In framing their own most strenuous exertions, they admit that these would scarcely prove effective without the co-operation of the public in a plan devised for the common advantage of all.

In former days, had there been water-fowl in our parks, some such notice as this would have been placarded:—"Whoever throws stones at, or frightens these birds, shall be prosecuted with the utmost severity of the law." In the present day we read the much more effective address:—"These birds are recommended to the protection of the public." However ragged the coat of the passer-by, his feelings not his fears are addressed and his public duty is gratified by being appointed as it were a temporary trustee for the safety of his feathered friends. The advantage of acting upon this principle is not confined merely to its direct efficiency for its purpose. A different and important benefit remains latent, one which never ought to be lost sight of in the enactment or the administration of laws. It enlists public opinion in favour of law and of order. Thus aiding the perverted, it rightly directed, and when legislation is gratified it renders the interference of the police far less necessary, and, when called for, more effective.

This principle might, perhaps, be applied with advantage to the admission, under regulations, of certain classes of *skilled* workmen by means of tickets, for a limited number of days.

Most effective assistance might be rendered both to the police and to the attendants at the Exposition by the following plan:—

Allow a certain number of persons, in whom the Executive can repose confidence generally to be nominated by manufacturers or employers, the latter recommending a small number of their best and most regular workmen or assistants, to whom should be granted tickets of admission, subject to the following conditions:—

1. Tickets of admission shall be granted for periods of from three to any greater number of days. Some tickets being for the first three days of each week, or otherwise, as may be convenient.

2. They shall either be gratuitous or obtainable by a small payment.

3. Each ticket-holder shall wear the ticket by a string from the button of his coat, or as may be arranged.

4. He shall, when required by the police or attendants, assist in any duty they may desire for the safety or general convenience of the expositors.

5. Whenever he observes any irregularity, or has reason to believe that thieves or improper persons have obtained admission, he shall report the nearest policeman.

6. Whenever he observes any machine or any object exhibited to be out of order, or in danger of being injured, or its parts misplaced, he is to communicate the fact to the nearest attendant, who will refer him to the proper superintendent of that department. He will explain the defect he has pointed out; and, if asked by the superintendent, he is to put it in order, or suggest the means of some other person then present who may be better able to complete the reparation.

7. Each master should be required to pledge his word that he will only recommend trustworthy persons. Each recommended might simply be required to give his word of honour that he would assist.

These regulations ought to be printed and stuck up in various parts of the Building.

It would, indeed, be desirable to have a certain number of boards placed in the most public parts of the Exposition, on which should be fixed bills of admission, to be filled up by visitors desirous of introducing a friend to the public. Also notices as to prices and hours of visiting the Exposition might from time to time be affixed. Each board ought also to have a plan of the ground-floor and galleries of the Building, on which the names of the different subjects and countries occupying the various parts might be readily ascertained by the visitors.

A history of the British Association prefaces a history of the Exhibition, and Mr. Babbage contends—

That, if the views of those who originally organised the British Association had been supported both from within and from without, in the manner which so important a project in the history of science deserved, the Exhibition of 1851 would have found itself led, as it would naturally have been, by the science of the country, prepared by long experience on a smaller scale, yet under very var ous circumstances, to meet with some reasonable prospect of success that gigantic undertaking, and to elicit from it the many invaluable services it might be expected to render to civilisation.

HOW TO SEE THE EXHIBITION IN FOUR VISITS. By W. BLANCHARD JERROLD. Visit I. Bradbury and Evans.

This little work will be found a more entertaining companion than the Official Catalogue, to which, however, reference must be made for the names and addresses of inventors and exhibitors. Keeping in view the almost overwhelming multiplicity of articles exhibited, any comparatively brief work descriptive of the Exhibition must be little more than a catalogue enumeration; but Mr. Jerrold, in the first of his visits, has certainly overcome this difficulty adroitly, by relieving his guide with reflective hints at certain desirable points of observation. We quote a specimen, the view being from the north-west corner.

Having arrived at this point, the visitor may well pause to notice the four colossal pieces of statuary which mark the four central corners of the main avenue. He may also notice from this point the huge glass chandelier with the gallery immediately above the statue of Falkland; the organ in the gallery above the southern entrance, and the general perspective effect of the galleries, with the huge draperies of all kinds and colours hanging from them in every direction. From this point he may hear faintly the gigantic organ which are in the Foreign and British departments, bells of huge proportions tolling lowly in the vast space, and the faint tinkling of grand pianos. So gigantic is the scale of the Building, that the loudest shout Lablache could raise from the great sea in the northern division of the transept gives, more than any other position to be noted in the Palace, an idea of the colossal size of the Building which contains it. At this point the visitor will generally find crowds of bewildered spectators looking about them, and endeavouring to imbibe from the splendid confusion a general idea of the great whole. To master an exhibition of dimensions and variety so unparalelled is no easy task to the visitor who is introduced to it, without some straightforward and comprehensive guide; and endeavouring to place ourselves in this position of guide, we have divided the Exhibition into two great divisions, the foreign and the British: and these divisions respectively into three distinct parts, consisting of the main avenue, the southern section, and the northern section. By adopting this division, the details, so far as the general visitor is concerned, are easily and effectually comprehended and enjoyed.

CELEBRATED TRIALS CONNECTED WITH the UPPER CLASSES of SOCIETY, in the relations of Private Life. By PETER BURKE, Esq., of the Inner Temple, Barrister-at-Law. Benning and Co., and Ollivier.

This work is intended as a second series of a work which experienced, a few years ago, a very favourable reception, and here the similar title of "Celebrated Trials connected with the Aristocracy, in the relations of Private Life." The difference between the two volumes is, that the latter extends the subject further, and gives those trials which regard not exactly titled personages, but parties who have moved in the higher ranks. Interesting as the former volume was, the new one surpasses it in the extraordinary and romantic character of the incidents and events narrated. Few novels or tales of fiction are of a more strange and startling nature than this collection of trials, teeming with romance and horror. Mr. Burke has made the book a readable and a safe one for all persons. He has carefully weeded each trial of legal technicality and prosiness, and has excluded all matter of indelicate or improper tendency. Among the cases included, we would point out as particularly interesting those of Arden of Faversham, Major Strangways, Mistress Rawlins, the Marquis Paleotti, Miss Knox of Prehen, Major Campbell, and the Clivell will. Some well-known trials, such as those of the Wakefields, Fauntleroy, and Rush, are also well reported here; and of what Mr. Burke states in his preface he correct, those trials increase the value of the book, from the strange difficulty there exists of finding any record of trials of moment after the period of their taking place.

These volumes, both the first and the second series, are books that ought to be read and thought over, as affording singular examples of the perversions and wanderings of the human mind. Even the trivial incidents we here and there find in them are passing strange; such, for instance, as an attorney, hanged for murder, praying on the scaffold in Greek to show his classical knowledge; and the Marquis Paleotti, also executed for murder, requesting of the sheriff that he might be allowed to die alone, and not come in contact on the gibbet with criminals of the vulgar class.

SACRED INCIDENTS. By PSYCHOLOGIST. 2 vols. Hampden and Co.

This is only a very small portion of the title-page to these volumes, in which it is declared that the said "Sacred Incidents" are "doctrinally considered and poetically described;" and such poetical description or doctrinal exposition is dignified with the character of "The Harmony subsisting between the Book of Revelation and the volume of Nature; setting forth the operations of the Angelic Host, the Power of God and Evil, as portrayed in Revelation, the History of Mankind, in Redemption, and the Resurrection." The two volumes carry us through the history of the world from the creation to the Israelites crossing the Red Sea; and the portion of history is told in verse, accompanied with doctrinal prose. But this is not all. The poem is designed for recitation—for public recitation, illustrated with "two hundred and fifty dioramic representations," now in contemplation, we believe, for part of the Great Exhibition of the present year, not in, but near the Crystal Palace. It will be seen, therefore, that "Psychologist" is a bold experimentalist. If, however, his success is to be measured by the value of his poem, we fear he will be invulnerable to the adventure of more much promise; indeed, we have seldom perused verses less meritorious in all respects. Pity, with so much ambition, that there should be so little power, and yet so much self-delusion.

HAMON AND CATOR; or, the Two Races: a Tale. Simpkin

This is a book. Traces of pastiral authorship are impressed on its every line. The writer, too, has a style distinguishable for his era. It is simple, natural, emotional, descriptive—but not fluent. It is concise; and, where necessary, effect is produced by repetition, not amplification. The story is one of stirring interest, though of a rude and primitive period. Hamon is the hero, and Cator is the murderer in the present tale; but society is rendered unsafe through his escape, and at length is compelled to hunt down the habitual homicide as a wild beast. The moral, we suppose, is designed to be in favour of capital punishment. We would much like to see a story equally powerful written on the opposite side of the question. The effect, we believe, would be incomparably finer; and, had the present author given a different termination to his argument, we believe that the work (for such it is, and a work of true art, too) would have commanded more than a common degree of attention.

SOMETHING ON RUSKINISM; with a Vestibule in Rhyme. By AN ARCHITECT. Hastings.

The author says that he shall be satisfied if the profession say of these pages, in the words of *Touchstone*, "that they are at any rate so-so." We concur in the opinion he desires—they are very so-so.

FLORILEGIUM ECCLESIÆ. By Miss ROSA RAINE. John Hughes.

This is "a manual of church poesy." The authoress is already we know as a writer of religious verse, and the present *brochure* will sustain her reputation.

MIXED POEMS, by a CLERGYMAN. Hope and Co.

By the title, the author seems to imply that these poems are both secular and religious. A few are neatly versified, but none of them rise above mediocrity.

THE EXILE, and other Poems. By CHRISTIANA E. POUR. Hope.

The fair writer has yet to learn the art of versification.

ETHEL LEA. A story by ANNA KING. Parker.

A child's book of no especial merit; in fact a very inferior production, in point of composition, and of small interest in the story. The moral, however, is well intended, and so far justifies its publication.

DUNHILL'S MODEL, IN THE EXHIBITION, OF A PROPOSED SUBURBAN CATTLE MARKET.

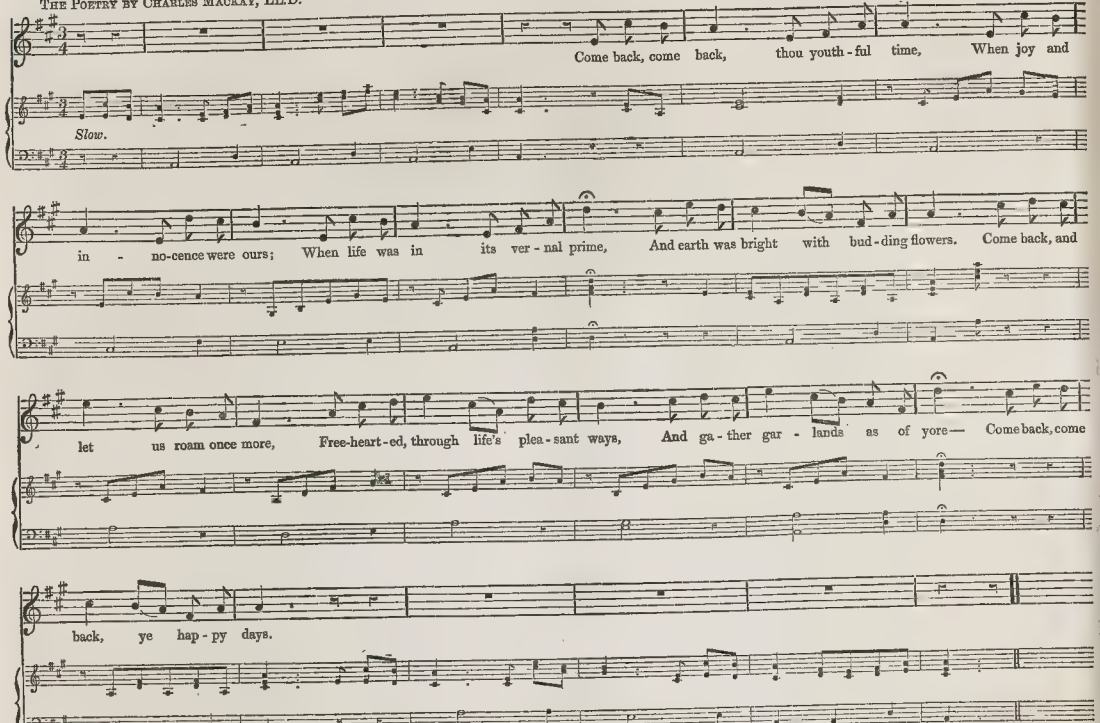
At the present time every assistance which can be given towards abolishing the frightful nuisances of Cattle and Meat Markets and Slaughter-houses from the great metropolis should be looked on with favour by the masses of the people, who would benefit by so great a boon being granted to them. Mr. Thomas Dunhill, C.E., who was examined before the Parliamentary Committee on this subject in 1847, and again by the Royal Commission in 1850, exhibits in the north-west gallery a large and beautiful model of a Cattle Market, Abattoirs, Carcase Market, Calf and Pig-markets, Melting-houses, Stallage, together with a Cheese, Butter and Cattle-drinking, so as to compose in one grand scheme a plan which shall rid London of almost all the abominable nuisances with which many of the most populous districts are polluted.

The site for this purpose, which the projector points out as most likely to answer the purpose, is in Copenhagen-fields, near to the Great Northern Railway. This situation he finds to be at an elevation above the Thames of about 200 feet; and therefore may be considered, so far as regards the layers for the cattle, a healthy spot, and yet not inconveniently distant from the centre of London.

The principal or cattle market he proposes to extend to 23 acres; and, by two principal roadways, with numerous cross-ways, every stall and pen could be readily approached. This large area would, according to Mr. Dunhill's calculation, accommodate 6000 head of oxen and 40,000 sheep; and the whole space proposed to be enclosed, for all the purposes comprehended within this useful scheme, is equal to 55 acres.

COME BACK, YE HAPPY DAYS.

THE POETRY BY CHARLES MACKAY, LL.D. THE MUSIC BY PAN.



Come back, come back, thou youth-ful time, When joy and
Slow.
in - no-cence were ours; When life was in its ver - nal prime, And earth was bright with bud-ding flowers. Come back, and
let us roam once more, Free-heart-ed, through life's plea-sant ways, And ga-ther gar - lands as of yore— Come back, come
back, ye hap-py days.

SECOND VERSE.

Come back, come back! 'twas pleasant then
To cherish faith in love and truth;
When nothing in dispraise of men
Had sour'd the temper of our youth.
Come back, and let us still believe
The gorgeous dream Romance displays,
Nor trust the tale that men deceive—
Come back, come back, ye happy days.

THIRD VERSE.

Come back, oh, freshness of the past,
When every face seem'd fair and kind;
When sunward every eye was cast,
And all the shadows fell behind.
Come back—oh, yes! true hearts can turn
Their own Decembers into Mays;
The secret be it ours to learn—
Come back, come back, ye happy days.

TO CORRESPONDENTS.

W V, Oldcastle.—Apply to Sherwoods, publishers, Paternoster-row

HARBARA, Dorset; and LADGIE.—The line "When Greek join'd Greek, then was the tug of war," is from Sir Lee's play of "Alexander the Great"

A Reply.—See "Walker's Manly Exercises," for the rules of bowls

ALUMNUS.—It was at the preliminary meeting, held at Osborne, June 30, 1849, that Prince Albert proposed that the Great Exhibition should be extended to the industry of all nations; but it was at the banquet given at the Mansion-house by Lord Mayor Farncomb, March 26, 1850, that Prince Albert first publicly explained the noble purpose of the Exhibition. This meeting proved of the most important service in the earliest stage of the project, and is any recognition of those public men who have contributed to the success of the Great Exhibition, the patriotic feeling and goodjesse of Alderman Farncomb, we dare say, will not be overlooked.

A J, Westminster.—Certain printers have long had a frontispiece stock face, with moveable bands, to "teach children how to tell the clock;" and large clock faces, to be used in schools, are also made for this purpose. Davidson's "System of Short-hand" is more practical than that described by our correspondent

INQUIRY, Kensington.—The line "England, with all thy faults I love thee still," is from Cowper's "Task," book ii, the Time-piece. Lord Byron quotes the line in his "Don Juan"

A CORRESPONDENT.—Excellent wax for making flowers may be bought of Mrs. Strickland, Pantheon Bazaar, Oxford-street

CURIOSUS, Hartlepool.—The Chinese coin is a one-cash piece, of China, of the Emperor Kien-Long, 1722-35. *Obverse*.—Kien-Long (above and below the hole), and Tong-Pien, i.e. current coin of the realm (at the sides of the hole). *Reverse*.—Pien-Kuang, i.e. Canton. The silver coin is a part of the Spanish piece of eight

NUMISMATIST, Liverpool.—The cost of a pair of florin dies will be about £15; though we are not prepared to say what the Mint florin dies may have cost the country

ANTIQUE.—The inscription seems to be from the two epistles of Edgar (sole Monarch), A.D. 959 to 979

X. Z., Edward VI. stepson. York paint, from 9s. 2. MARY's great bonfire her marriage. From 2s. 3. Apply to Mr Hearne, bookseller, 81, Strand, for the "Numismatic Manual," 1840

J O G, Newport.—The half-crowns of George II. is of no value

AN OLD SUBSCRIBER.—Your coin is a screw-dollar of the town of Augsburg. It was the custom in Germany to have the dollars made to unscrew, and to place inside them pa ntings, carved ivory plates, written prayers, &c. I myself have seen some dollars of Augsburg of that time, containing portraits of various persons in a military dress, among others that of an Imperial Governor of the town, accompanied by a painted representation of the Holy Trinity. If, on comparison with an authenticated portrait of the Prince of Condé, yours should agree, then it would certainly have more historical interest than the screw-dollars have in general

AN OLD SUBSCRIBER.—Coorissy always accords the designation of Captain to one who has a any time held that commission in H M army

R S T.—Prince Albert's father was brother of the Duchess of Kent

W R.—If the arms and pedigree be already registered, the expense is trifling, not exceeding two guineas

DEAN, Dublin.—The correct and usual pronunciation is coc

A CONSTANT READER.—F and G are first cousins of the half blood

H H.—The subsequent marriage of the parents does not, in England, legitimise the child that has been born out of wedlock

H E.—"Barry of ten or and as. a bend treflé vert," are the arms of SAXONY as borne by Prince Albert

WINTOUN SACKVILLE.—The Shelleys are a family of great antiquity and high position They have been settled in Sussex from a remote period. That county was the first place they became established in Mr Nicholls, of Parliament-street, is the publisher of Mr Long's work, the price of which is 10s 6d

E N T.—The arms of Beaumont of Yorkshire are—"Gu. a lion rampt. arg. langued and armed az., within an orle of cruscrts of the 2d. *Crest*.' A bull's head erased, quarterly arg and gu. *Motto*: Fide sed cui vide." Our correspondent seems to have a fair claim to these heraldic bearings

HOWELL.—The simple adoption of the third name, as an additional surname, would legalise the assumption. If a Royal Licence were obtained, the cost would be fifty guineas, but without this the assumption is legal

ROUGE DRAGON.—If the envelope be sealed with an heraldic device, the party is liable to the

OGICRON.—Earl Fitzhardinge uses the same arms as belong to the Earldom of Berkeley. The Earl of Derby's are—"Arg on a bend az. three bucks' heads cabossed, or. *Crest*: On a chapeau gu. turned up erm. an eagle, wings endorsed, feeding on an infant in its nest ppr. swaddled as., banded of the third. *Supporters*: Dexter, a griffin, or, sinister, a buck, also or; both dncally collared and chained as., the buck attired of the last. *Motto*: Sans changer'

A CORRESPONDENT, in answer to H, gives the following information.—The paternal coat of arms of Leonard Troughear was—"A five-pointed star arg. on a field as." He assumed the name and arms of Holmes from the sentiment of his maternal uncle, Thomas Lord Holmes of whom Leonard Troughear's mother was the eldest sister.

CERBERUS SIX ARTICLES.—We think, at Aberdeen

AN INQUIRER INTO HERALDRY.—The arms of Burton, of Falde, co. Stafford, Lindley, co. Leicester, and Dronfield, co. Derby, are—"As a fesse between three talbots' heads, erased or *Crest*: A beacon, arg, burning ppr, standing on a mount vert. *Motto*: Lux vitæ" The coat of arms of one person does not apply to another of the same name, unless that other be of the same family

CORNWALL.—The arms of Furness are—"Arg. a talbot sejeut as. in chief, three crescents gu. *Crest*. Out of a dncal coronet a Non's paw holding a lance ppr."

M C.—*Arms of Chambers*: "Ba. a cross couped erm between four martlets rising or. *Crest*: Out of a ducal coronet or, a demi-eagle displayed gu., wings erm."

M U S, Oxford.—Crest of Sanders: "A demi-bull rampt. gu., armed or (changed sometimes with a rose arg. barbed and seeded ppr)"

T H. The arms of Holman: "Vert, a chev. or between three phœns arg. *Crest*: On a chapeau gu. turned up erm. an ostrich's head arg."

HISTORICAL SOCIETY OF PENNSYLVANIA.—We would recommend a design to be made, incorporating in one shield such devices as would commemorate the leading incidents in the history of the State. It would be unbearable to quarter the arms of countries together, and the conclusion of peace would be equally against rule

T E S.—Arms of Keel: "Per cross crenelée arg and sa.; in the first quarter a crescent of the second"

A CONSTANT SUBSCRIBER.—Arms of Remington: "Barry of twelve arg. and az. Over all, a bend gu. *Crest*: A hand erect, holding a broken tilting spear, all ppr. *Liceras*: White and red."

LEONARDES.—The arms of Hargreaves of Lancashire are—"Quarterly, or, and vert, on a pesse gu. between two stags current counterchanged, a fleur gu." It is best correct for a lady's second husband to impale the first husband s arms

BUSHCHILDE.—Arms of Bowerman: "On a bend cottised as., three boars' heads couped or. *Crest*: A goat's head erased or, the horns twisted gold and sa."

P C H.—We can find no arms to the name of Charnley

LECTOR BENEDICTUS.—Robert le Diable, Duke of Normandy, was father of William the Conqueror Prince Rupert was nephew of King Charles I, being second son of Frederick Duke of Bavaria, the Elector Palatine, by the Princess Elizabeth of England, sister of that Monarch

AN EXHIBITOR TO THE GREAT EXHIBITION.—Arms of Milton: "Per pale az. and gu., an eagle displayed with two heads or, within a bordure engr of the last"

ETIQUETTE.—In society, where the regulations of precedence are adhered to, a Baronet's unmarried daughter would go before the married wives of those of inferior position

WILLIAM.—1. Garnet of Lancashire.—*Arms*: "Gu. a lion rampant arg., dncally crowned or, within a bordure engr of the last." The present William Garnett, Esq., of Bleasdale Tower, has had a grant from the Heralds' Office, somewhat differenced, viz.: "Gu. a lion rampt arg., dncally crowned or, within a bordure nebuléé" also, "Or a caston of the last, thereon an eagle displayed with two heads as." 2. Arms of Allison: "Gu. a chev. or, between three eagles' heads erased arg. *Crest*. An eagle's head erased as."

GUTCH.—A Marquise's destination is "Most Honourable"

THE ILLUSTRATED LONDON NEWS.

No. 500.—VOL. XIX.] SATURDAY, JULY 12, 1851. [TWO NUMBERS, 1s.

THE QUEEN'S VISIT TO THE CITY.

THE visits which, from time to time, the Sovereigns of England have paid, with all the splendour of state ceremonial, to their ancient city of London, have, for the most part, been matters of mere form and routine. Custom exacted such visits on the accession of the Monarch, and the Monarch most usually conformed to the custom, because compliance was considered, in the popular estimation, to be almost as essential a part of the ceremonial as the Coronation itself. The first visit paid to her capital by Queen Victoria was of this character. Very different in its origin and motives was the last visit, which our columns this day record. It was modelled upon no former ceremonial, but stands by itself, one of the most gratifying public displays of a year which has been singularly prolific of such pleasing, as well as unexpected events.

When Queen Victoria first visited the city of London, she was no stranger to the hearts of the people. Though her character and disposition were unknown, many virtues were expected of her.

KING LEOPOLD AND THE ROYAL CHILDREN OF BELGIUM.

LEOPOLD, King of the Belgians, may fairly claim to rank among the best, and, in many respects, the most fortunate of monarchs. His reign, viewed politically, is peculiarly prosperous. He rules over a free, moral, industrious, and contented people, who, after achieving their own emancipation, have had the further rare and pre-eminent good fortune of knowing how to make use of liberty. With them, under the guidance of their King, all has been caution, conciliation, and moderation. Whilst the nations around them have been convulsed by revolutions and discord, the Belgians have kept steadily the same, their energies devoted to agriculture, manufactures, and commerce, and their lives spent in the furtherance of internal order and domestic comfort.

The story of this Belgian people, escaping so well, after the malice domestic and foreign, that shook them not many years ago, is a strange one, but far stranger is the biography of their present King. His life is curiously mingled up with some of the most important events in the modern history of Europe; he seems indeed to have always happened to come advantageously upon the scene when there was any regal or political difficulty to be overcome—a kind of providential interloper, such as Horace alluded to when he speaks of the "dignus vindice nodus." The salient points of this Monarch's eventful and career are very interesting, and well worth contemplating.

Leopold, King of the Belgians, now in his sixty-first year, unceasingly fortunate in his political career, has, in his domestic life, experienced much happiness, chequered by much grief and sorrow. His alliance with a Princess the heiress and darling of England ended, before twenty months had elapsed, in a day of the deepest mourning that, perhaps, ever fell upon a husband or a nation. Yet from his House came the light that was to dispel a people's despair, and to relume and realize their brightest aspirations. The Royal widower's sister herself a widow—espouses the Duke of Kent, and Leopold becomes the uncle of England's most cherished of sovereigns, Queen Victoria, who strengthens the tie by her alliance with his nephew, Prince Albert. A revolution gives Leopold himself a throne and another bride endowed with every virtue. The House of Saxe-Coburg is once more in close affinity with that of Guelph, which, by Leopold's second marriage, is also in some measure linked to the House of Orleans—a union most fortunate to the dethroned family of France. The Royalty of England gives the exiles a warm welcome, and Leopold's house at Claremont affords them a home. King Leopold, meanwhile, and his little kingdom are calmly isolated in the centre of a "sea of troubles." Amid the convulsions of empires and the crash of revolutions, the Belgian Monarch wields an unshaken sceptre. One, too, cannot but here note the recent death of the King of Holland, whom Leopold had by so strange and mysterious a concatenation of circumstances unwittingly ousted of bride and throne. A short time, and Leopold has to undergo another trying hour of sorrow. His second consort, the excellent Queen Louisa of Orleans, the friend of Queen Victoria, and the delight of all who knew her, passes away in the summer of her life, borne down, no doubt, by the afflictions of her House: she leaves to her husband and his kingdom three surviving children. The King is at present a widower, with two sons and a daughter.

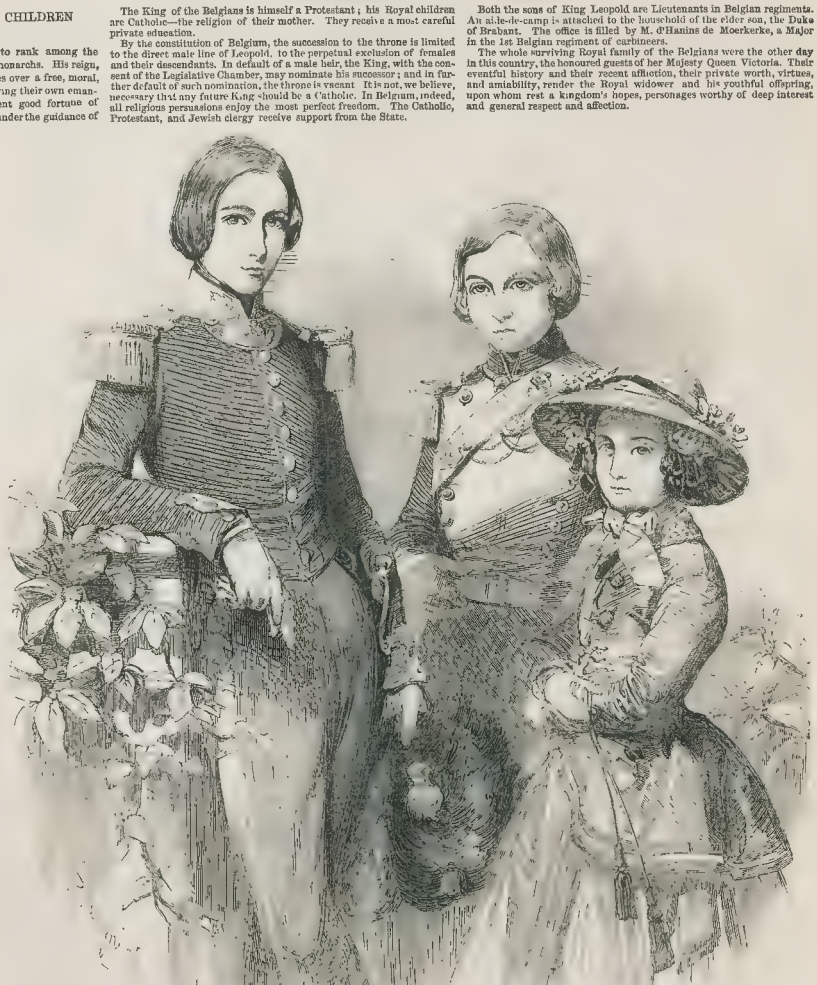
In the names given to his Royal issue, his Majesty of Belgium has displayed his usual good feeling and good taste. There cannot be a stronger proof of how anxiously he wishes to cherish the recollection of every one connected with his two marriages, so bright, so happy, and alas! so transitory in their duration. King Leopold's elder son, the Duke of Brabant, the Prince Royal and heir of Belgium, now in his seventeenth year, is styled Leopold Philippe Marie, thus uniting the names of his father, his grandfather, and his mother. The second son, the Count of Flanders, now aged fourteen, is styled Philip Marie Leopold George, thus not only recalling the Christian names of the same relatives as his brother, but also bearing a name of his father's affinity to the House of Brunswick. Lastly, the King of the Belgians's only daughter, the Princess Charlotte, now aged eleven, gracefully perpetuates, by her name the memory of an English Princess, whom consort and country loved so well and mourned so deeply.

The King of the Belgians is himself a Protestant; his Royal children are Catholic—the religion of their mother. They receive a most careful private education.

By the constitution of Belgium, the succession to the throne is limited to the direct male line of Leopold, to the perpetual exclusion of females and their descendants. In default of a male heir, the King, with the consent of the Legislative Chamber, may nominate his successor; and in further default of such nomination, the throne is vacant. It is not, we believe, necessary that any future King should be a Catholic. In Belgium, indeed, all religious persuasions enjoy the most perfect freedom. The Catholic, Protestant, and Jewish clergy receive support from the State.

Both the sons of King Leopold are Lieutenants in Belgian regiments. An aide-de-camp is attached to the household of the elder son, the Duke of Brabant. The office is filled by M. d'Hanins de Moerkerke, a Major in the 1st Belgian regiment of carbineers.

The whole surviving Royal family of the Belgians were the other day in this country, the honoured guests of her Majesty Queen Victoria. Their eventful history and their recent affection, their private worth, virtues, and amiability, render the Royal widower and his youthful offspring, upon whom rest a kingdom's hopes, personages worthy of deep interest and general respect and affection.



DUKE OF BRABANT. COUNT OF FLANDERS. PRINCESS CHARLOTTE.

THE ROYAL CHILDREN OF BELGIUM.—DRAWN BY BAUGNIET.

When a second time the Queen visited the ancient city, it was no longer a mere formality to which she lent the splendour of her presence; but the inauguration of the new Temple of Commerce, to which she, as the Sovereign of the greatest commercial people on the face of the globe, was appropriately invited. The circumstances were peculiar, such as had not been known in England since the remote days when another Queen highly popular in her time, and still remembered with good-will in the traditions of the people, opened the first Royal Exchange as a place where the merchants might congregate. Comparisons between Elizabeth and Victoria were not wanting at that period—all of them to the advantage of the living Queen, whose merits as a constitutional Sovereign, and the head of English society, as much transcended those of her illustrious predecessor as the Great Britain of the nineteenth century excelled in wealth, power, civilisation, intelligence, and true liberty the England of the sixteenth. The ceremonial was magnificent. The occasion was one of a nature to interest in the highest degree all classes of the people; and it was universally felt that the solemn consecration of the Commercial Temple, and the unveiling of the words that are emblazoned upon its front, would have lost much of their worth and significance, if the head of the State had not been present to recognise in the face of the people, and of the world, that "the earth is the Lord's, and the fulness thereof."

The third visit of the Queen to London, and which we must call the last, until some new occasion shall invite her again into the same scenes, was still more remarkable than either of those which preceded it. The Queen inaugurated the great Palace of Trade, in 1839; but there remained one more inauguration of an edifice still more suggestive, which required all the extraneous pomp and circumstance of Royalty to give it befitting grace and value. The Palace of Industry, and the peaceful gathering upon our shores of the representatives of the art, skill, and labour of our own and foreign lands, received the recognition which they demanded; and the most beautiful and novel building in the world, erected for purposes which, next to those of religion, are the highest that can call forth the feelings or energies of a civilised people, witnessed one of the most gratifying spectacles ever recorded in history, when the young Queen of the Isles, with her illustrious Consort and her interesting family, and surrounded by the aged chieftains who fought in long-past wars—happily no longer necessary—by her high officers of state, by her brilliant Court, and by tens of thousands of an applauding people, walked in slow procession through its long and fairy-like avenues, and proclaimed, in actions more eloquent than words, the dignity of labour and the peaceful union of all tribes and families of men. It only needed the visit of the Queen to the Guildhall of London, to receive, in a scene of festivity, the Commissioners and other persons of our own and foreign nations, by whose labours the Exhibition has been made so splendid and so successful, to add the last graceful touch to the great moral work of the year 1851. Certainly Europe could afford no parallel to the scene enacted in London on Wednesday evening last, when Queen Victoria, in the full blaze of an unprecedented popularity, fully merited by her public and private virtues, proceeded through her illuminated capital to accept the hospitality of a tradesman, and express, in her quality of chief magistrate and Sovereign of this great nation, her approval of the efforts of those who had made London for a time the world's wonder, and who had set an example which can scarcely fail, in after times, to produce results full of as good augury for the future progress of the nation.

The political reflections that force themselves upon the mind on an occasion like this are many; and, without entering upon that wide subject, we cannot fail to notice as among the most obvious the gratitude which Englishmen feel, that at such a time of trouble and perplexity throughout Europe, such a scene could have been possible here, and in no other capital. There is not a Sovereign or ruler in all Europe, who may not well envy Queen Victoria; and there is not a nation in the Eastern or Western hemisphere, who might not envy and imitate the patient industry, the calm self-reliance, the respect for law and order, and the moral character of the great mass of English society. The condition of the British people is not, through all its ranks and gradations, what it might be; but, without indulging in Utopias, the most frigid must confess that, with such a people, improvement, social, moral, and political, is not hopeless; and that, by the blessing of Providence, we may long hold our place in the front rank of the world, and, as we have done before, "teach the bewildered nations how to live."

IRELAND.

PRESBYTERIAN SYNODS.

The discussions at the present sittings of the general assembly of the Presbyterian Church of Ireland are characterised by more than usual warmth. Dr. Brown, at the *ordered* of Friday week, having charged Dr. Cooke with being formerly opposed to the Confession of Faith, a scene of uproar ensued, which was recorded in the local papers.

Dr. Cooke rose; the uproar redoubled; the crowds in the passage, where Dr. Brown stood, rushed up, and all was confusion for a moment. Dr. Cooke's voice at length was heard rising above the din, exclaiming—It is a vile calumny; it is false

Dr. Brown—I repeat that what I state is a fact.

Dr. Cooke—I repeat it is false; and I add, it is one of the most unfounded statements a man could make. (Uproar.)

Mr Rodgers—Call order, Moderator. Is Dr. Cooke permitted to proceed in this manner? (Uproar.)

Dr. Cooke—Yes, sir, he is permitted to proceed, as long as he proceeds in order, as he does now.

Mr. Rodgers—You were not interrupted when speaking. Dr. Brown listened to your speech in patience—(Hisses) and you interrupt him every moment.

Dr. Cooke—And I will interrupt him when he speaks untruth.

Mr. Rodgers—The Moderator ruled that a person was not to be interrupted while speaking, but he replied to when he had concluded.

Dr. Cooke—Unless when men say what is not true.

Mr. Rodgers—Now, I ask you, Moderator, is this to be permitted? (Hisses from the gallery.) I ask the Assembly, is there a Christian here can tolerate the language used by Dr. Cooke? (Uproar.)

Dr Cooke—I will again repeat what I said before, that the assertion, as regards me, is a vile calumny. (Increased uproar.)

Dr. Brown—I will prove it by several witnesses.

Dr. Cooke—I care nothing about your false witnesses; Christ was sentenced on the testimony of false witnesses.

Moderator—Order, order. Proceed, Dr. Brown.

Mr Gamble—A word, Moderator. I can't stand here—(Uproar, cries of "Order," and "Hear Dr. Brown")—I can't stand here—(Cries of "Sit down then.") One word, Moderator. I can't stand here and listen to Mr. Reid use the expression he did when Dr. Cooke said Christ was convicted by false witnesses. (A Voice: That was private conversation, Gamble.) When Dr. Cooke mentioned Christ, Mr. Reid said "You have nothing to do with him." ("Oh, oh," and great outcry.)

Mr Reid—I said no such thing, sir; your assertion is untrue. (Oh, oh.)

Mr. Gamble—I assert you did. (Uproar.)

Mr. Reid—I did not, sir; and you are very wrong in persisting in such an insinuation against a brother minister, when you are told it is untrue.

Mr. Gamble—I am satisfied now (looking towards Dr. Cooke); I am satisfied. (Then turning to Mr. Reid, and leaning over his pew)—Well, what did you say?

A conversation *sotto voce* was carried on between both rev. gentlemen, mingled with snatches of remarks on the occurrence, continued for some moments. Many of the expressions used were harsh, but as they were scattered more "under than in part of the proceedings of the meeting, we refrain from mentioning them here.

The Lord-Lieutenant held a chapter of the Order of St. Patrick on Thursday week for the purpose of investing Lord Massarene and Ferrard with the insignia of the order.

From statistical accounts published in the *Milan Gazette* of the 28th ult., it appears that since the 17th of May last the court-martial of the Eastern Lombardo-Venetian district has pronounced 312 condemnations, including 118 sentences of death. In 1849 there were 2514 sentences pronounced by courts-martial at Padua and Rovigo; in 1850 the number sank to 1329. There have been 223 in the first quarter of the present year.

The Corporation of London have granted a further sum of one hundred guineas in aid of the funds for the erection of the new Hospital for Diseases of the Chest of the Victoria Park, the foundation-stone of which was laid a short time since by Prince Albert

FOREIGN AND COLONIAL NEWS.

FRANCE.

The question of the Revision of the Constitution, which has so long agitated political parties in France, has at length been brought fairly and fairly before the nation and the Legislature, by the very able report of M. de Tocqueville, who had been appointed for the purpose by the committee to which the Assembly had referred the various propositions on the subject for consideration.

M. de Tocqueville read his report to the Assembly on Tuesday. It is a great state paper, of more than ordinary fulness and length, and treats the question in a very comprehensive and philosophical manner. Its main recommendation of a practical remedy for the present unsettled state of the Government of France is, however, confined to one proposition; viz. the summoning of a Constituent Assembly instead of the present Legislative Chamber, for the purpose of revising and amending the existing Constitution of the Republic.

The prominent minor features of the report are, first, a denial of the divine right which General Cavaignac and his party claim for the republic, M. de Tocqueville maintaining that the nation has an inherent and indisputable right to choose whatever form of Government the people may deem most suitable for the country; and, secondly, the affirmation of the absolute necessity of observing, inviolate in every respect, the existing constitution of the Republic, should the proposed revision be rejected by the Assembly. This latter view is directed against any unconstitutional and illegal election to the office of the Presidency of the Republic, as would be the case if either Louis Bonaparte were re-elected, or the Prince de Joinville or Ledru Rollin elected to the Presidency—the only three candidates that happen to be, at present, mentioned.

Examining the consequences of an unconstitutional election, M. de Tocqueville asks what should be the result? The country would not only abolish one article of the Constitution, but virtually destroy the entire Constitution. The Assembly would have on the side power, honour, and right, but at what price should it triumph? Who could foretell the issue of such a struggle, which would either end in usurpation, civil war, or anarchy, and would certainly prove the ruin of the Republic and liberty.

Having touched on the origin, nature, and relations to each other of the two great powers of the state, viz. the Presidency and the Assembly, and the inconveniences and dangers resulting from their being equally powerful and independent of each other, without any supreme power above to decide between them, M. de Tocqueville states the reasons of the committee for rejecting the various schemes of revision submitted to them, and concludes with the following as the proposition which they had resolved to recommend for the adoption of the country:—"Taking into consideration Art. 111 of the Constitution, the Assembly decides that the Constituent Assembly is charged to revise the Constitution."

In order to assist at the inauguration of the bronze statue of Jean Hachette, the celebrated heroine, animated by whose example, the town, in the fifteenth century, defended itself successfully against Charles the Bold, Duke of Burgundy. He was very well received, and, previous to the banquet usual on such occasions, there was a grand tournament given by the officers of a cavalry regiment stationed in the town.

RUSSIA.

According to the *Universal German Gazette*, which has derived its information from Russian correspondents, the troops of Russia serving against the Circassians have, within the last month, been completely defeated by Mohammed Emin, one of the lieutenants of Schamil, and their loss is stated at 5000 killed or prisoners. It is added that the Circassians have resolved to carry on the war vigorously during the summer.

UNITED STATES.

The latest accounts from New York are to the 26th ult. They reiterate the rumoured intention of the United States Cabinet to propose to England a Free-trade for the small states of Central America; (free) town to be a free port, and the San Juan a free river. It is also stated that a federal government had been agreed upon between the states of Nicaragua, San Salvador, and Honduras, and that they had been engaged to establish friendly relations with the Washington government. It is also announced that orders had been issued by the Secretary of the Treasury, permitting Canadian vessels to load and unload at ports in the United States so long as similar privileges are extended to American vessels in Canadian ports. No foreign vessels are, however, to be permitted to engage in the America an coasting trade.

The movement in South Carolina in favour of the secession of that state from the Union is declining.

Further accounts from California state that the town of San Francisco was being rapidly rebuilt, the whole of the goods which were on shore at the time of the fire were consumed.

The long unsettled state of affairs with the Californian Indians has at length been placed on a more satisfactory footing, which binds the Indians themselves to refrain from all acts of aggression on the whites, and also to live on peaceful terms with the other Indian tribes. They relinquish the title to the lands they hold, and occupy four townships between the Mercedo and Tuolumne rivers. The United States agree to provide for the comfort of the Indians, to cherish the arts of peace, and to furnish the means of education and improvement. The day after the execution of the treaty, the Indians removed to their new homes, under the superintendence of the commissioners.

The coal discovered in Oregon proves to be of a superior quality, burning with an intense heat, and leaving no residuum but light red ashes. The quantity is said to be inexhaustible, and it can be delivered on the Columbia river at less than ten dollars per ton. The intelligence from the gold mines of Oregon was favourable. Most of the miners are able to make from 6 dols. to 12 dols. a day. In the opinion of competent judges, the mines will pay well for the next fifty years. A good deal of injury has been caused in that part of the country by the ravages of the Indians, who cherish a deadly hostility towards the whites.

WEST INDIES.

The accounts this week from Jamaica are to the 12th of June last. Last week's arrivals and New York have anticipated in most respects the news thus conveyed. On the north side of the island the cholera still lingered, particularly in the parish of Hanover. It had likewise re-appeared at Up-park Camp, three miles from Kingston, among the troops. At the latter place, although the disease appeared in a somewhat violent form, the mortality was by no means great, and at the time of the packet's departure it was said to be on the decrease.

The Board of Council and House of Assembly of Antigua had agreed to petitions which are to be presented to the Lords and Commons, prepared by a joint committee, against any further diminution of the differential duties on foreign sugar and coffee.

From Trinidad, under date the 11th ult., we learn that Governor Lord Harris on his departure, had received a valedictory address from the inhabitants, and was succeeded by Colonel Ward as acting Governor.

CAPE OF GOOD HOPE.

We have intelligence this week from the Cape, to the 3rd of May, by the Mail screw-steamer *Bosphorus*, which arrived on Monday last, the 7th, although not due until the 12th inst.

The state of affairs continues most unsatisfactory, the colonists becoming daily more discontented at the promised Constitutional Government being withheld from them, and, in consequence, giving little or no aid to Sir Harry Smith against the Kaffirs; whilst those latter, though generally worsted whenever they can be come at in skirmishes, remain, on the whole, as free from subjugation, and as harassing and destructive in their desultory assaults upon the colonists and their property, as they were at the commencement of the hostilities.

The accounts given by the passengers of the *Bosphorus* as to the state of matters are extremely conflicting, but almost the unanimous opinion of every one is disturbance. The statement of some is that the position of affairs is by far more precarious and unsatisfactory than on the departure of the previous mail. The Kaffirs are said to have determined to have united, and to be carrying off cattle in bands of 50 and 100 at a time, destroying the homesteads of the settlers, and driving the cattle before them off the land. This is one side of the picture. The regiments arriving whilst these letters were in course of preparation were all safe and satisfactory state; or, at least, that they are no worse than last accounts made out.

From the colonial papers we learn that Sir Harry Smith continued with the head quarters at King William's Town, and that no decisive engagements had taken place. The Kaffirs avoided meeting our troops in the field, and the operations on our side were confined to harassing the enemy by a succession of patrols.

The *Vulcan* steamer, wit the 74th Highlanders, arrived safely at the Cape on the 12th of May.

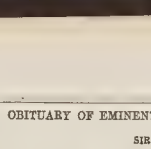
Captain Thompson, of the schooner *Iris*, was drowned at East London, together with a seaman, in attempting to land in a surf boat.

Her Majesty has been pleased to extend the Royal patronage to a projected grand military *fête* in aid of the funds of the Industrial Home for Gentlewomen.

A little boy named Thomas (son of David Thomas, otherwise "Dai Chwr," of North Abbey) met with a shocking death at Abberdulais (North Wales) on works on Thursday week. The lad was at work on a mill, when he inadvertently came within reach of the morticing cap of the immense shears used for cutting pin, and worked by steam power. In an instant the poor boy's head was severed from his body, and rolled along the floor.

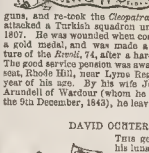
OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

SIR JOHN TALBOT.



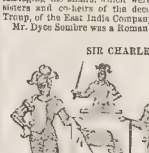
THE Hon. Sir John Talbot, Admiral of the Red, and a G.C.B., was third son of Richard Talbot, Esq., by his wife, the Baroness Talbot, and brother of the late Lord Talbot de Malahide. He was a very gallant seaman; he entered the navy at an early age, and served under Lord Nelson in the *Boreas*. He was senior Lieutenant of the *Astræa* at the capture of the French frigate *Gloire*, in 1795, for which he was promoted. As captain of the *Leander*, in 1805, he captured the *Vile de Milan*, of forty-six guns, and re-took the *Cleopatra*, her prize. As captain of the *Tonnderer* he attacked a Turkish squadron under Point Vesquies, in the Dardanelles, in 1807. He was wounded when commanding the *Victorious* in 1812; he received a gold medal, and was made a Knight Commander of the Bath for the capture of the *Arnold*, 74, after a hard-fought action. He became a G.C.B. in 1844. The good service pension was awarded him in 1847. Sir John Talbot died at his seat, Rhode Hill, near Lyme Regis, Dorsetshire, on the 7th inst., in the 83rd year of his age. By his wife Juliana, third daughter of James, ninth Lord Arundell of Wardour (whom he married on the 17th October, 1815, and who died the 9th December, 1843), he leaves two sons and five daughters.

DAVID OCHTERLONY DYCE SOMBRE, ESQ.



This gentleman, whose proceedings connected with his lunacy have attracted much public attention, died on the 1st instant at his apartments in Davies-street, Berkeley-square. Mr. Dyce Sombre was the adopted son of the late prince or sovereign of Sirdhurah, in Hindostan, and was acknowledged her heir by the East India Company. The property he thus succeeded to amounted to many hundred thousand pounds. After completing his education in the native Oriental style, he came to this country from India about twelve years ago, and offered himself as a candidate for Sudbury at the election of 1841. He succeeded in being returned; but was soon after ejected from his seat, for bribery and corruption, which mainly contributed to the disfranchisement of the borough. In 1840 he married the Hon. Mary Anne Jervis, daughter of the present Viscount St. Vincent, but separated from her some time after, without having had any issue. For several years before his death, Mr. Dyce Sombre was declared to be incapable of managing his affairs, which were administered by the Lord Chancellor. The sisters and co-heirs of the deceased gentleman are the wives of Captain Trant, of the East India Company's service, and of General Soldroft. Mr. Dyce Sombre was a Roman Catholic.

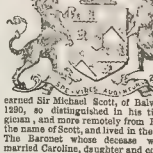
SIR CHARLES BANNERMAN, BART.



The death of this Baronet occurred on the 18th instant, in Carlton-street, London. Sir Charles was fifth son of Sir Alexander Bannerman, the sixth Baronet, by Mary his wife, daughter of James Gardyn, Esq., of Banchory; he was born 18th August, 1782, and succeeded to the Baronetcy at the decease of his brother, in 1840. He married, 14th August, 1821, his cousin Anne, daughter of Charles Bannerman, Esq., and by her, who died in 1838, leaves issue an only surviving child, the present Sir Alexander Bannerman, ninth Baronet, born April, 1823.

The surname of Bannerman is said to have been assumed from the office of banner-bearer to the King, and the family is one of considerable antiquity.

SIR DAVID SCOTT, BART., R.H.



This gentleman died at his residence, in Gloucester-place, on the 18th inst., in his 68th year. He was only son of the late David Scott, Esq., of Dunninald, county Forfar, M.P., Chairman of the Board of Directors of the East India Company, by Louisa his wife, daughter and co-heiress of William de Lagard, Esq., and succeeded to the title of Baronet at the decease of his mother's brother-in-law, Sir James Sibbald, of Sollwood Park, in 1819, that gentleman having obtained a special limitation in the patent. The Scotts of Dunninald annually derive from the earned Sir Michael Scott, of Balweiry, Ambassador to the Court of Norway, 1290, so distinguished in his time as an astrologer, alchemist, and magician, and descended directly from Richard, who, unquestionably, first assumed the name of Scott, and lived in the reigns of Malcolm IV. and William the Lion. The Baronet whose decease we record was born 25th July, 1782. He married Louisa, daughter and co-heir of the late Benjamin Grindal, Esq., a lineal descendant of Edmund Grindal, Archbishop of Canterbury, and had issue three daughters and two sons, of whom the elder, now Sir James-Siebald-David Scott, third Bart., is married to Harriet Anne, only daughter of Henry Shank Esq., of Castlerig and Glenbirnie, county of Fife, and has issue.

Sir David, at an early age, was returned to Parliament for Yarmouth, Isle of Wight, but reached his seat on account of ill health. The order of the Guelph, of Hanover, was conferred upon him by King George IV. Sir David resided for many years at Brighton, where he was much beloved by all classes; and the poor especially have to lament the loss of a constant friend and a ready and able adviser.

HENRY ST. GEORGE TUCKER, ESQ.

MR. TUCKER, so long distinguished in connexion with the East India Company, was born in February, 1777, at Bermuda, of which island his father was president of the council, and acting Governor. At a very early age he proceeded to India, and in 1790 became secretary to Sir William Jones. Not long after he received an appointment to the Civil Service, his rank as writer bearing date June 24, 1791. In 1796 he became Persian interpreter to the Board of Trade, and secretary in the revenue and judicial department, and in 1801 was nominated to the arduous and important office of Accountant-General, which he held continuously, with the exception of the brief interval of his partnership in the house of Cockerell and Co., for several years. In 1815 he finally quitted India, leaving behind him the highest character for ability, zeal, and integrity in the public service. His retirement from Indian affairs was devoted to maturing and digesting the results of his lengthened Indian experience, to the indulgence of his literary taste, and to the acquisition of that widely-extended information that qualified him, as well by his private as by his public talents, and soon after Lord Auckland's advent to office was made Comptroller of her Majesty's Household: he was also a Privy Councillor. Mr. Lascelles married, the 14th May, 1852, Caroline Georgiana, eldest daughter of the late, and sister of the present, Lord Auckland, by whom (with whom he) he leaves a large family. To the deep regret of all who knew him, Mr. Lascelles died of an affection of the brain, on the 2d inst., at his residence, Campden hill, Kensington. He was in his 63d year.

MR. LASCELLES.

THE Right Hon. WILLIAM SAUNDERS SERGISON LASCELLES, M.P., was the third son of Henry, second Earl of Harewood, and next brother to the present Earl: he was born the 26th October, 1798. For many years, Mr. Lascelles was an active member of Parliament. Before the passing of the Reform Bill he sat for Northallerton: afterwards he represented Wakefield and Knaresborough. The Right Hon. gentleman was latterly a constant supporter of the Whig Administration, and soon after Lord John Russell's advent to office was made Comptroller of her Majesty's Household: he was also a Privy Councillor. Mr. Lascelles married, the 14th May, 1852, Caroline Georgiana, eldest daughter of the late, and sister of the present, Lord Auckland, by whom (with whom he) he leaves a large family. To the deep regret of all who knew him, Mr. Lascelles died of an affection of the brain, on the 2d inst., at his residence, Campden hill, Kensington. He was in his 63d year.

The *Eastern Counties Herald* announces that the Rev. F. S. Barff, B.A., and the Rev. Thos. Dykes, B.A., who recently resigned their office as curates in the Holy Trinity Church, were admitted, on Sunday morning last, into the Roman Catholic communion, and received the sacrament in the Roman Catholic chapel, Jarratt-street, from the hands of the Rev. Mr. Mortler.

ST. MARYLEBONE SAVINGS-BANKS.—The open deposit accounts on July 5, 1851, were £21,878; sums invested, £234,073: on July 5, 1850, accounts, £20,866; invested, £215,638.

On Saturday the Lords of the Admiralty visited Greenwich Hospital, for the purpose of inspecting and examining the boys of the Naval Asylum Schools. Having visited the Upper School, the boys went through the various examinations in mathematics, navigation, &c., in all of which their Lordships expressed their fullest satisfaction at the progress made in the various important studies. The Lower School also gave very great satisfaction, and elicited much applause towards both masters and pupils.

IMPERIAL PARLIAMENT.

HOUSE OF LORDS.—MONDAY.

The Ecclesiastical Titles Assumption Bill was brought up from the House of Commons, and read a first time, and ordered to be read a second time on Monday week.

Lord KINNAIRD moved that the House resolve itself into Committee on the Farms Buildings Bill.

Lord HARDWICKE opposed the motion, on the ground that it would give facilities to landed proprietors to lay charges on their estates to be paid by their successors.

Their Lordships divided, and the numbers were—For the bill, 18; against it, 36: majority, 18. The bill was consequently lost.

Lord ELLENBOROUGH moved for certain returns connected with the case of Jotee Pershaud, and stated a variety of facts confirmatory of his observations on a former evening relative to the unfair trial and illegal imprisonment of that person.

Lord BROUGHTON defended the Government of India from the observations of the noble Earl, and expressed his hope that the present, like many former charges against it, would turn out to have been greatly exaggerated, if not altogether without foundation.

After a few observations in reply from the Earl of ELLENBOROUGH, the subject dropped.

SMITHFIELD REMOVAL.

Earl GRANVILLE moved the second reading of the Smithfield-market Removal Bill, which was agreed to without discussion.

Lord MONTEAGLE, in moving for certain papers connected with the Papal aggression, availed himself of the occasion to state his objections to the measure which had been sent up to them from the House of Commons.

The Marquis of LANSDOWNE deprecated any discussion of the bill until it should be brought regularly under the notice of their Lordships on its second reading.

The papers were ordered.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

On the motion of Mr. HATTER, a new writ was ordered for the borough of Knaresborough, in the room of the Hon. W. S. Lascelles, deceased.

The House resumed the committee on the India and House Duty Bill. The remaining clauses were agreed to after some discussion, and the report was ordered to be brought up to-morrow.

The Woods and Forests, &c. Bill was then passed through committee.

THE NEW HOUSE OF COMMONS.

On the motion for the House resolving itself into a committee of supply on the civil services, &c.

Sir D. ROBERTS moved an amendment that the architect of the New Palace at Westminster be requested to lay before the House forthwith a report in detail on the manner in which he would recommend that the interior decorations of the new House of Commons, and of the halls and rooms connected with it, should be completed; and that he be directed to prepare his plans with due attention to the style of decoration usually adopted at the period to which the general architectural character of the new Palace is referable.

The CHANCELLOR of the EXCHEQUER deprecated any interference on the part of the House between Mr. Barry and the Commissioners. He believed, however, that in the course of a fortnight the new House of Commons would be ready to receive its members, and nothing stood in the way in which the building was proceeded with, that he should ever live to see it finished.

The amendment of Sir D. ROBERTS was ultimately negatived without a division, and the House went into committee of supply on the civil service estimates.

SUPPLY.

The vote of £32,000 for secret service was opposed by

Mr. WILLIAMS, who moved its reduction to £30,000. There was a prevalent opinion that the money was chiefly spent for electioneering purposes.

Colonel SIBTHORP confessed that it was a very trifle of "secret" he considered sufficient to confide in it. The hon. and gallant member proceeded to indicate various ways of insidious character in which he suspected that the money was or might be expended by the Ministers.

Lord JOHN RUSSELL defended the opponents of the vote but none of the money was spent in bribery or corruption

The discussion was ultimately closed by a vote, when the amendment was negatived by a majority of 71.

Several other votes were passed, and the House resumed.

The Loan Societies Bill was read a third time and passed.

Adjourned at one o'clock.

HOUSE OF LORDS.—TUESDAY.

The Apprentice to the Sea Service Bill was read a third time and passed.

The Attorneys' and Solicitors' Regulation Act Amendment Bill was read a second time.

The Expenses of Prosecutions Bill was read a third time and passed.

The Earl of SHAFTESBURY moved the second reading of the Lodging-Houses Bill, and urged strongly on their Lordships the necessity of adopting measures for improving the dwellings and otherwise ameliorating the condition of the working classes in the metropolis.

After a short discussion, in which several Peers took part, the motion was agreed to.—Adjourned.

HOUSE OF COMMONS.—TUESDAY.

The House had a mid-day sitting, in which it was occupied with the discussion of the clauses of the Civil Bills (Ireland) Bill, which eventually passed the committee, and was ordered to be reported.

In the evening sitting,

THE CRYSTAL PALACE.

Mr. STAFFORD presented a petition from Joseph Paxton, setting forth that in designing the Crystal Palace, he had quite as much in view the subsequent purposes for which it might be used as the immediate object of its erection; and praying that the House would take some means of preserving it to the country. He (Mr. Stafford) begged to move that the petition be printed with the votes, and to give notice that he intended very shortly to call attention to the subject. (Hear.)

CHANCERY REFORM.

Viscount PALMERSTON, at the bar, presented to the House her Majesty's gracious answer to the address of the House, moved on the 28th of June, by Mr. J. Stuart, praying her Majesty to add two lay members to the Chancery Commission. He had to inform the House that her Majesty had given directions accordingly.

SPIRITUAL DESTITUTION.

Viscount PALMERSTON also presented to the House her Majesty's gracious reply to the address moved by the Marquis of Blandford, praying "that she will be graciously pleased to take into her consideration the state of spiritual destitution existing throughout England and Wales; with a view that her Majesty may be pleased to direct the adoption of such measures as she may deem expedient, for extending more efficiently to the spiritual wants of the people, and for an extension of the parochial system corresponding to the growth of a rapidly increasing population by the help which may be drawn from the resources of the Established Church itself." Her Majesty had commanded him ("Viscount Palmerston") to inform the House that the attention of her Government had previously been directed to the best means of rendering the resources of the Established Church available for affording the most efficient means of spiritual instruction to the people of this country, and that they might be assured of her Majesty's cordial concurrence in the adoption of a well-considered measure for promoting this important object.

ATTORNEYS' CERTIFICATE DUTY.

Lord R. GROSVENOR moved for leave to bring in a bill to repeal the attorneys' and solicitors' annual certificate duty. The noble Lord said he would be content not to do more than lay the table with a view to its consideration during the next session; but he would not even do that if the Chancellor of the Exchequer would say that when the income-tax should have been decided upon he would allow this tax to be amongst the first to be considered with a view to its repeal.

The Chancellor of the Exchequer opposed the motion, and said, however happy he might be to say "Yes" to every proposal for the reduction of taxes, yet due regard to the finances of the country would not permit him to go further in the way of repealing taxes than he had indicated in his financial statement. If, however, he were in a different position, he did not think that the duty in question was the precise one which should take precedence of all others in being abolished.

After a few words from Lord R. GROSVENOR in reply,

The House divided, and the numbers were—For the motion, 162; against it, 132: majority against the Government, 30.

THE BALLOT.

Mr. HENRY BERKELEY moved for leave to bring in a bill for protecting the parliamentary electors of Great Britain and Ireland by taking the votes by way of ballot. In supporting the motion the hon. member divided the evils attending the present system into two classes, those from intimidation, and those from corruption. Respecting the former, he remarked that fear restrained a large proportion of qualified persons from placing their names on the register, preponderant vented more than a third of the registered electors from recording their votes, and compelled a large number of those who did vote to give their suffrages to a candidate they did not approve. On the second head, Mr. Berkeley referred to calculations he had on previous occasions presented to the House, and which showed that 48 peers and 17 rich members of the Commons held absolute control over the return of 98 representatives of the people. After illustrating his argument by a copious detail of circumstances said to have occurred during recent elections in Falkirk, St. Albans, Bath, and other places, he demanded the ballot as a right not less than as a boon to the electors in great cities, as a shield between them and their customers, and to the tenant-farmers of the counties as a protection against their landlords.

Mr. ELLIS seconded the motion.

Mr. HUME, although he highly approved of the ballot, considered that the extension of the suffrage was entitled to prior rank as a measure of necessary reform. In accordance with this belief he had placed an amendment on the paper for leave to bring in a comprehensive bill, enacting household suffrage, triennial parliaments, and a new electoral division of the country, in addition to the ballot. These reforms the hon. member advocated at considerable length, but, yielding to the representations which had been made to him, he consented to withdraw his amendment, and allow the vote to be taken on the ballot question alone.

Captain SCOBELL, in a maiden speech, announced himself an old supporter of the ballot.

The House then divided, and the numbers were—

For the motion	.. ..	.. 87
Against it	.. ..	.. 50
Majority	.. ..	—37

The announcement of the numbers was received with loud cheering.

Mr. SCULLY then moved:—"That, in order to lighten the severe pressure of poor rates in Ireland, it is expedient to facilitate by every means the employment of the inmates of workhouses in reproductive labour, so as to make these establishments, as far as possible, self-supporting; and that it is the duty of the Poor-Law Commissioners to see so desirable an object fully carried out."

Mr. O'FLAHERTY seconded the motion.

Sir W. SOMERVILLE was fully alive to the importance of the subject, but there were difficulties in the way of carrying out the object in view. It would be strongly objected to that free labour could not compete with the labour of paupers in workhouses. He hoped the hon. gentleman would leave the matter in the hands of the Poor-Law Commissioners

After some discussion, in which several hon. members took part,

The House divided, and the numbers were—

For the motion	.. ..	.. 42
Against it	.. ..	64
Majority	.. ..	—22

The Mercantile Marine Act Amendment Bill was read a second time.

Adjourned at half-past twelve o'clock.

HOUSE OF COMMONS.—WEDNESDAY.

QUALIFICATION OF MEMBERS OF PARLIAMENT.

On the motion for the House resolving itself into committee on the Colonial Property Qualification Bill,

Mr. TUFNELL moved that it be an instruction to the committee to provide for the abolition of any property qualification for the election of members to serve in Parliament. The hon. gentleman dwelt at some length on the case of Mr. Prinsep, the late member for Harwich, who, although a man of undoubted wealth and respectability, was yet rejected upon some technicality connected with his qualification. He also referred to the fact, that in the case of Scotch members no qualification whatever was required, and he could not see why a distinction should in this respect be made between the representatives of that country and the rest of the empire.

Mr. EWART, as a Scotch member, seconded the motion, and reminded the House that the Scotch members were not the only exceptions to the rule, for the members for the Universities were likewise exempted

Lord J. RUSSELL said the proposal came before the House in a somewhat singular shape, being an amendment on a bill for admitting colonial property as a qualification. The real question was, whether there was any security in this qualification, which no one had any difficulty in obtaining, so far as to satisfy the examiners, even though not really possessed of it. He thought there was no security whatever in it, and he therefore could see no reason why the whole question of qualification should not be taken into the consideration of Parliament; and he should be prepared to give it certainly his favourable consideration, but in the shape in which it was now brought before them he thought it could not be entertained. It should be brought before the House in the shape of a bill, when [illegible] fortnight the new House of Commons would be ready to receive its members, and nothing stood in the way in which the building was proceeded with, that he should ever live to see it finished

THE ALGERINE FAMILY, AT VAUXHALL-GARDENS.—(FROM A DAGUERREOTYPE BY BEARD.)

THE NORFOLK GIANT.

ROBERT HALES, the Norfolk Giant, was born May 2nd, 1820, at the village of Somerton, near Great Yarmouth, Norfolk. His father, a respectable farmer, was 6 feet 6 inches in height, and married Elizabeth Dimond, of the same neighbourhood, who was 6 feet in height, and weighed 14 stone. Her family consisted of five daughters and four sons, all of whom attained an extraordinary stature—the males averaging 6 feet 5 inches in height, and the females 6 feet 3½ inches. The height and weight of Robert Hales—whose Portrait we have engraved—are as follows:—Height, 7 feet 6 inches; weight, 33 stone (14 lb. to the stone); measurement round the chest, 62 inches; round the abdomen, 64 inches; across the shoulders, 36 inches; round the thigh, 36 inches; round the calf of the leg, 21 inches.

In 1848, Mr. Hales had a great desire to see the Western World; he accordingly took passage on board H.M. Royal mail steamer *Canada*, and after one of the most boisterous and dangerous passages ever made across the Atlantic, he arrived in New York on the 14th December, 1848. He remained in America two years, during which time he excited much curiosity in the States.

In January, 1851, he returned to England, and took the Craven Head Tavern, in Drury-lane. On the 11th of April Mr. Hales had the honour of being introduced to her most gracious Majesty the Queen, and his Royal Highness Prince Albert, and six of the Royal children, at Buckingham Palace.

Hales is cheerful and well-informed, and has none of the unwieldiness for which persons of extraordinary stature are remarkable.

ROYAL THAMES YACHT CLUB PRIZE CUP PRESENTED BY HER MAJESTY.

"JOHN BULL."

WILLIAM BALL, the extraordinary man who is also known as "John Bull," was born at Hersehay, in Shropshire. His height is 5 feet 9¾ inches; circumference of neck 23½ inches; arm, 27 inches; breast, 70 inches, stomach, 80 inches; thigh, 50½ inches; calf of leg, 25 inches. His weight exceeds 40 stone. He is healthy and very active, and worked forty years puddler and shingler for the Colebrook-dale company of ironmasters.

WILLIAM BALL (JOHN BULL), A NATIVE OF SHROPSHIRE; HEIGHT, 5 FEET 9¾ INCHES, WEIGHT, 40 STONE.

ROBERT HALES, THE "NORFOLK GIANT."

ILLUSTRATED LONDON NEWS

KENSINGTON GARDENS.—THE BAND.

KENSINGTON GARDENS.

ONE of the most refreshing delights of the London season, more especially of its meridian, is a visit to Kensington Gardens; and, if made upon Tuesday or Friday, when a military band plays near the new Lodge, the visitor will enjoy the addition of fine music to the beauties, natural and artificial, of the gardens themselves. Mr. Wesle, in his big book about London, recommends those who wish fully to appreciate Kensington Gardens, "to go there on a hot and sunny, or dusty, or windy day, when they will experience, particularly in the northern parts, the pleasure of having a sheltered and shady retreat, free from all the dust and dirt and bustle of the busy thoroughfares." In this wordy advice, however, the writer has forgotten the "Band," which, of late years, has been one of the fashionable attractions of the place: the days of its playing are occasionally changed—at present they are as stated above; the best hour, from five to six.

The gardens attached to Kensington Palace, when purchased by William III., did not exceed 26 acres. In 1691 they were described as "not great, nor abounding with fine plants. The orange, lemon, myrtle, and what other trees they had there in summer, were all removed to London or Mr. Wise's Greenhouse at Brompton Park, a little mile from there. But the walks and grass were very fine, and they were digging up a plot of four or five acres to enlarge their gardens." Queen Anne added 30 acres, which were laid out by her gardener, Wise. Bowack, in 1705 describes "a noble collection of foreign plants, and fine neat greens, which makes it pleasant all the year. Her Majesty has been pleased lately to plant near 30 acres more towards the north, separated from the rest only by a stately greenhouse, not yet finished." It appears from this passage, that previous to 1705 Kensington Gardens did not extend further to the north than the conservatory, originally built for a banqueting-house, and frequently used as such by Queen Anne. The eastern boundary of the Gardens would seem to have been at this time nearly in the line of the broad walk which crosses them before the east of the Palace, and which our Artist has chosen for one of his views. The kitchen-gardens, which extended north of the Palace, towards the Gravel Pits (but are now occupied by elegant villas), and the thirty acres north of the conservatory, added by Queen Anne to the pleasure gardens, may have been the fifty-five acres "detached and severed from the park, lying in the north-west corner thereof," granted in the 16th of Charles II to Hamilton, ranger of the park, and Birch, auditor of excise, to be walled and planted with "pippins and red-streaks," on condition of their furnishing apples or cider for the King's use. At the end of the avenue leading from the south front of the Palace to the wall on the Kensington-road, is an alcove built by Queen Anne's orders; so that Kensington Palace, in her reign, seems to have stood in the midst of fruit and pleasure-gardens, with pleasant alcoves on the west and south, and a stately banqueting-house on the east, the whole confined between the Kensington an

KENSINGTON GARDENS.—THE BROAD WALK.

Uxbridge roads, the west side of Palace-green, and the line of the broad walk before the east front of the Palace,

> Where Kensington, high o'er the neighbouring lands,
> Midst groves and sweets a regal fabric stands,
> And sees each spring, luxuriant in their bowers,
> A new creation of blossoms, and a wild of flowers;
> The dames of Britain oft in crowds repair
> To gravel walks and unpolluted air:
> Here, with the town in dance and dreadful gaiety,
> They breathe in sunshine, and see azure skies;
> Each walk a robe of various dye bespread,
> Seems from afar a moving tulip-bed.
> When o'er it breathes and flowery damasks glow,
> And chints, the rival of the showery bow.—TICKELL.

Again:—

> Now the shrill corn-pipe, echoing loud to arms,
> To rank and file reduces the straggling swarms

Pointing to the musical attractions in Tickell's time. Addison, in the "Spectator," No. 477, raises the cry against London to the heroic pests of gardening, and is enraptured with their treatment of the upper garden at Kensington, which was at first nothing but a gravel-pit, "the hollow basin, with its seemingly mount of trees, evidently delighting the eastern."

In the reign of George II., Queen Caroline added to the gardens nearly three hundred acres from Hyde-Park, and had the canal formed at the cost of £6000; whilst with the new ground, and the old, at the south-east end of the Gardens. North and south, the grounds were bounded by high parallel walls. On the north-east, a fosse and low wall reaching from the Uxbridge-road to the Serpentine at once shut in the Gardens, and confined the eye along their central vista, over the Serpentine, to its extremity; and across the Park, to the east of Queen Anne's gardens, immediately in front of the palace, a reservoir was formed, called "the round pond," and thence long vistas were carried through the woods that encircled it, to the head of the Serpentine, to the fosse and Bridgeman's ha-ha wall, affording a view of the Park, and to the mount already mentioned, which, with its evergreens and temple, has disappeared within recollection.

We have a word or two to say of the olden fashion of the Gardens. After King William took up his abode in the palace, a Court end of the town gathered round it. The large gardens laid out by Queen Caroline were opened to the public on Saturday, when the King and Court went to Richmond; and it is this one-day privilege to which Lord Seymour alluded in the recent conversation in the House of Commons. All visitors were then required to appear in full dress. When the Court ceased to reside at Kensington, the gardens were thrown entirely open; they still, however, retain much of their stately south-ern. Tom Port Crabbe was accustomed to describe their effect as "not exhilarating, yet alive and pleasant."

Of late years, Kensington Gardens have been greatly improved by drainage, re-laying out, and the removal of walls and substitution of open iron railing. In place of describing these changes, however, by aid of Mr. Weale's book, let us glance at their present characteristics.

Standing near the Palace, and looking eastward, the leading features are three openings or avenues, the best of which is terminated by Hyde Park, the intermediate and surrounding parts being filled in with dense masses of ancient trees, a total absence of anything that indicates the vicinity of the town, which is very agreeable, especially on a summer's day: the umbrageous stillness is only broken by the clatter of carriages, "like notes by distance made more sweet." The view down these avenues from the opposite side of the Serpentine, near the Serpentine, is, however, much better, being terminated by the Palace.

On entering the Gardens near the bridge over the Serpentine, and keeping on the east side of the water, some noble old elm-trees will be found on the right, just within the gates. From this point to the head of the Serpentine, the walk beneath the fine old trees, with glimpses of the water, and of the lawn and trees on the opposite bank, is one of the most picturesque parts of the Gardens.

Immediately in front of the Palace is a small flower-garden, of quaint design: and between this and Kensington are some rows of stately old elm-trees, very rich and fine. At the end of one of the short avenues is Queen Anne's lofty architectural alcove. Keeping along the southern margin of the Gardens, and crossing the end of the broad walk (which is fifty feet in breadth), a new walk will soon be reached, and here will be found a large number of the newer and rarer kind of shrubs, all legibly named. "It is in the introduction of these rarer plants that the idea of a 'garden' is, perhaps, better sustained than in most of the other features of the place, which are those of a park. The demand, indeed, for evergreens and undergrowth in these Gardens is most urgent; and if (which we greatly doubt), there exists a well-founded objection to the use of laurels and boxes in tufts or as single plants, there certainly can be no reason why solitary specimens, or varied groups of the many kinds of thorn, pyrus, mespilus, laburnum, pine, and fir, evergreen oaks, hollies, yews, &c., should not be most extensively planted, and a large proportion of the younger and smaller trees in the densest parts cut away to make room for them."—*Weale.*

NEW VOLUME of the NATIONAL ILLUSTRATED LIBRARY.

This day is published, price 2s. 6d.,

THE MORMONS; or, LATTER-DAY SAINTS,

With Memoir of the Life and Death of Joseph Smith, the American Mahometan.

ILLUSTRATED WITH FORTY ENGRAVINGS.

The Student's Help.—Every Lady's Guide to her own Greenhouse.—The Cambrian Pictorially Displayed in England and the Exhibition.—The Three Eras of Ottoman History Music.—Christmas Rose.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JULY 12, 1851.

The present Government has been so often placed in a minority, that such events have ceased to be of significance; but, although it holds office upon a similar principle to that which sustained in the shafts the wheezy and crazy cab-horse, immortalised by our great contemporary novelist, its defeat twice in the same evening is, to say the least of it, remarkable. Lord Robert Grosvenor, in the interest of the attornies, moved for leave to bring in a bill to relieve them from the payment of the annual duty charged upon the practice of their profession; and, although the Chancellor of the Exchequer, with the view of saving, and not caring to part with £220,000 per annum, which might be much better employed, opposed the motion with all the weight of the Government at his back, Lord Robert carried his point by the somewhat considerable majority of 162 against 132. Hardly had that motley and heterogenous assemblage of parties in the House which includes all that are not Whig indulged in the titter, comment, and shrug of the shoulder which are usual on such occasions, when Mr. H. Berkeley, in a very good speech, made his annual motion for leave to bring in a bill for the protection of Parliamentary voters by the ballot. The Government did not think fit to allow any one of its members to oppose the proposition, no doubt with the idea that the promise of a future measure of Parliamentary reform, to be introduced by the Premier himself in 1852, and the apathy with which most people regard the dried up and utterly withered and lifeless question of the ballot (and of which the rush of members out of the House as soon as the subject was broached was sufficiently strong proof), would be sufficient to ensure the rejection of the proposal. The result showed that the Government somewhat miscalculated, for Mr. Berkeley's motion was carried by a majority of 87 against 50. But, although such defeats are not creditable to the Government, following as they do upon so many other proofs of its temporary and make-shift position, no one anticipates any consequences from them. They make it no weaker than it was, and give the Earl of Derby no encouragement to overturn a Ministry which he still possesses before. The victories of Lord Robert Grosvenor and Mr. Berkeley will remain unproductive. The attornies will continue to pay for their annual certificates for a considerable time longer—at least, until after the excise duty upon paper shall have been abolished, and until many other taxes, almost equally injurious to the people, shall have been removed; and the ballot will remain a speculative and a dull question, to be avoided in the House and in the public journals—alike uninteresting to the classes and to the tap-rooms of the land. The present is not the time for the discussion of partial measures either of financial or of parliamentary reform. Nothing will or can be done to satisfy the friends of either, until the session of 1852; until which time the Russell Ministry, weak as it is, may bid defiance to all kinds of opponents, and insure itself against a Parliamentary death. Should no internal difficulties arise among its own members to expedite a catastrophe, the Government seems to be quite safe until February next, when the Chancellor of the Exchequer, with a new scheme of taxation, and the Prime Minister, with the promised complement of his great Reform measure of 1831, will enable it either to strengthen itself in the estimation of Parliament and the country by carrying these reforms, or to expire with dignity upon issues which will be worthy of it. In the meantime defeats count for nothing.

The report presented by M. de Tocqueville to the French Legislative Assembly, on the revision of the Constitution of the Republic, is a most important, as well as most elaborate, ably-reasoned, and judicious state paper. There is no man in France to whom the composition of such a document could have been entrusted with so

much propriety as to this eloquent writer and close observer—whose work on the United States of America has procured him a wide reputation as a philosophical statesman of the highest class, and compared with whom such men as M. Thiers are but molehills to a mountain. M. de Tocqueville, in the following passage of his exhaustive argument, sums up and depicts the dangers that menace France, from the present unsatisfactory state of the Constitution, and suggests the remedy:—

If the election of the President of the Republic had taken place at the natural period pointed out by the Constitution, that is, on May 12, 1849, the Presidential powers would have survived those of this Assembly by one year; and if, in 1851, after a twelve years' trial, that the fact of the Executive power it is only in 1851, after a twelve years' trial, that the fact of the Executive power and the Legislative Assembly ceasing at the same time their functions would have been witnessed. But, by the accidental effect of the law of Oct. 28, 1848—a law called for by Article 116 of the Constitution—the President was elected on Dec. 10, 1848, and will, nevertheless, have arrived at the end of his magistracy in the course of May next. Thus, in the same month, and within a few days' distance of each other, the Executive power and the Legislative power will change hands. Assuredly, never will a great people, as yet ill prepared for the use of Republican liberty, have been cast all at once, by the law itself, into such a hazard—never will a youthful constitution have been subjected to so rude a hazard—never will a youthful constitution have been subjected to so rude a trial! And in what country of the globe, gentlemen, is this total eclipse of the Government to take place? Amongst that people which, although it has more frequently overturned its Government, perhaps, than any other, feels more than any one the want of being governed.

The nations which have a federative existence—these even which, without having divided the sovereignty, possess an aristocracy, or even a hereditarial liberties deeply rooted in the habits of the people—such nations may exist for a length of time with a feeble Government, and even support for a certain period the complete absence of a Government. Each portion of the people has an existence of its own, which allows society to remain still upstanding for a certain time after the general life-current is impeded or stopped. But are we one of those nations? Have we not centralised all kinds of affairs, and by that course created the necessity, which of all others is the most easy to overturn, but which, at the same time, it is the most difficult to do without for a single moment? And at what period must we support such a trial? Immediately after a great revolution, in the midst of the irregular passions and appetites which every revolution carries behind it, and which are always but indifferently restrained by the still existing institutions. Is that an imaginary danger? Is it one of those accidents which are met in the history of all free people? Is it not rather one of those certainties which we ought not to allow our country to run when we can preserve it from it? The only regular and legal means by which we can succeed in that—the only means, perhaps, which remains to us to prevent all the power from deserting, in unconstitutional hands, or from falling *en déshérence* (without lawful heirs) is to hand them over momentarily to a Constituent Assembly, which will have in its favour the authority of the nation itself, and the force of youth.

M. de Tocqueville's proposition, and the triumphant manner in which he has disposed of the arguments of all those who have offered different suggestions for the pilotage of the Republic out of the shoals into which it is drifting, have already excited a beneficial influence throughout France. The difficult question has assumed a practical shape, and the issue to be decided has been cleared of extraneous irrelevancies, and narrowed to a point which makes it intelligible to every class of politicians. The debates that will immediately ensue cannot fail to excite the greatest interest, not only in France, but in every part of Europe.

THE REVENUE.

The official returns of the amount of the Queen's Revenue, ending Saturday last, July 5, show a decrease on the quarter, as compared with the corresponding quarter of last year, of £95,354, which, however, is very insignificant, when it is recollected that the Summer quarter of last year was one of unparalleled prosperity, and that the gradual reduction of the timber and sugar duties has been in operation in the interim.

The items are as follows:—

DECREASE ON THE QUARTER.	
Customs	£15,490
Stamps	66,375
Taxes	26,030
Property Tax	49,554
Crown Rex	10,000
	168,749
Repayments of advances	64,880
Total decrease	233,649
INCREASE ON THE QUARTER.	
Excise	£94,585
Post-office	30,000
Miscellaneous	9,767
	£134,352
Imprest and other moneys	3,943
Total increase deducted	£138,295
	95,354
Total decrease on the quarter	

The returns for the year ending July 5, 1851, show a total decrease of revenue of £218,739.

Under the head of Customs there is a decrease, as compared with last year, of £35,122, which is accounted for by the recent reduction of Customs duties; while the Excise, on the other hand, shows an increase of £122,273. Under the head of Stamps, there is a diminution to the extent of £285,250 —which is, however, less than the amount which the Exchequer nominally sacrificed by the new Stamp Act of last session. We also see a decline of £23,840 on the item of Taxes, and of £106,418 on the Property-tax. The Post-office, however, has yielded £74,000 more during the past twelvemonths than during the year which expired on the 5th July, 1850—a striking proof of the activity of trade and commerce. On the whole, the returns are of a satisfactory character.

CHURCH, UNIVERSITIES, &c.

UNIVERSITY OF LONDON.

The annual distribution of scholarships and prizes took place on Saturday last, at the University College, the Right Hon. Sir James Graham, Bart., presiding.

Professor Malden read the report of the last year. It stated that the number of students in the Faculty of Arts and Law who had studied during the last session was 241: 85 of these had attended the ordinary classes, and 87 the courses of lectures addressed peculiarly to schoolmasters. In the course of the year the University had conferred the degree of LL.D. on an old student, as well as the degree of C. B. Estcott to Leominster, Herefordshire; the Rev. Arthur Henry Pelle Trewman to North Petherton, Somerset; the Rev. Harwood to Whapilede, Lincolnshire; the Rev. S. T. Smith to Wirksworth, Derbyshire; the Rev. Alexander Bean Russell to Westbury-cum-Priddy, Somerset; the Rev. W. Athil to Horsford, Norfolk; the Rev. George Braithwaite to St. Peter the Great, in the city of Chichester; the Rev. James Reece to Braithwaite, in the county of York; the Rev. Jones Davis to Capy Conwyl with Llanswell, county of Caermarthen.

TESTIMONIALS.—The following clergymen have lately received testimonials of affection and esteem:—The Rev. George Weigall, incumbent of St. George's, Wolverton station, to commemorate the eleventh year of his ministry; the Rev. H. B. Bullocke, from the parishioners of St. Mary's, Truro, on his ceasing to be curate of the parish; the Rev. J. Holmes, on his resignation of the St. Bartholomew's, Liverpool: the Rev. D. James, from the members of Order of Druids in the Huddersfield district; the Rev. H. M. Mosse, of Christ Church, Liverpool, from the young members of his congregation, lately preached by him; for confirmation: the Rev. Richard Malone, late of Christ Church, Plymouth, from the congregation, on his resignation; the Rev. John Twells, St. John's College, from the children of the Ollerton National Schools.

THE BISHOPRIC OF BOMBAY.—It is understood that the Bishop of Bombay, the Rev. Dr. Carr, who has been for the last few months in England on leave of absence, has placed his resignation in the hands of the proper authorities; and also, that the vacant see has been conferred on the Rev. John Harding, rector of St. Andrew's by the Wardrobe and St. Ann's, Blackfriars. Mr. Harding has occupied this living for the last ten or twelve years, and he was for a considerable period honorary secretary to the Church Pastoral Aid Society.

THE GREAT EXHIBITION.

THE same progress, the same success, and as great an amount of positive public interest as ever, have been manifested during the past week. The number of visitors keeps steadily towards 60,000 per day on the shilling days; whilst on Fridays and Saturdays, those who desire carefully to study the innumerable interesting objects brought together, have ample opportunities of doing so; or, if desirous merely to lounge away an idle hour, and see and be seen, the afternoons of the latter day are sufficiently fashionable and select for the most fastidious.

The great elephant question, arising out of the perplexing present of the Nawab Nazim to her Majesty, seems likely to be set at rest; and a preserved specimen of sufficient bulk has been at length run down in Essex, which will be forthwith transferred, under the superintendence of its captor, Mr. Bibram, and forthwith to the upper regions of the interior of the howdah and other portions of the Nawab's princely contribution: we certainly anticipate that this will not be the least attractive of the many novelties which have been so rapidly added to the already wonderful display.

The Queen's inspections have been resumed and pursued with the usual business-like tact; and on this day her Majesty pays her thirty-fifth visit to the Exhibition. On Saturday last the task undertaken was no ordinary one: about 1000 exhibitors were present for the purpose of explaining the peculiar excellence of the wares or examples they displayed; and when it is considered that these consisted in many instances of philosophical instruments, civil engineering models, surgical instruments, miscellaneous mechanical contrivances, and glass, the courage of her Majesty in undertaking such an inspection is undoubted. The glass, which was inspected first, was comparatively straightforward work, with much to interest and instruct; but to go through the millenium of all the varied claims of rival pianofortes appeared more than the Queen could bear, and the Royal party moved as rapidly as possible through this department. The models in civil engineering attracted much attention; and some of the miscellaneous contrivances also, but many of these are of so singular a character as to create a wonder how the inventor could ever expect any one but themselves to take any interest in them. Amongst surgical instruments examples of dentistry were placed: the exhibitors in this department mustered very strongly, and displayed decurnum: display their contrivances, either as adapted to incisors or molars, whether it was agreeable or not; but her Majesty pursued her examination in "spite of their teeth."

On Wednesday the electric telegraph and agricultural implement department were visited, the Queen and Prince, together with the Royal children, remaining until long after the Building was crowded with eager spectators, all anxious to see them: and their wishes were amply gratified; for, by an admirable arrangement, a passage was formed from the agricultural department to Holland, leading to the exit door, and thousands had an unexpected opportunity of seeing her Majesty and her family depart. These visits are a source of much gratification to all parties, and quite astonish the simple our foreign visitors.

On Tuesday nearly 66,000 persons entered the Building, and this number has only been exceeded on two days, 17th and 24th June. The receipts were £2415 5s. On this, as on other days, the gratifying feature of whole regiments of children of both sexes, from the various schools in and around the metropolis, ought to be noticed. These youngsters usually arrive with a hearty hurrah, but at their departure are too much fatigued to attempt such a demonstration. The various working-men's visiting associations continue to send up their thousands; and the amount of good feeling thus engendered or perpetuated between the employers and employed, arising out of the assistance rendered, and ready co-operation given by the latter to the former, is a most delightful feature. We understand that the members of the association from Norwich, now in town, were to have a treat yesterday (Friday), provided for them by the worthy member for that city, Mr. Peto, M.P., in the form of a trip down the river to Woolwich, and a substantial entertainment when there; the whole expense being defrayed by the gentleman named, out of a tribute to their self-denial and providence in depositing their little savings for so excellent a purpose as a visit to the Exhibition. The sensations of those workmen at Norwich who have not done so wisely will not be of the most enviable kind, whilst the encouragement thus given to others may be very great and have an abiding influence.

The week has been more than usually prolific in *fêtes* to the Royal Commissioners, the executive, their officers, and the jurors. The Grand Ball at the Guildhall is illustrated in another part of our impression; but, in addition to this, Mr. William Brown, M.P., the chairman of the Liverpool merchant and shipowner of Liverpool, on Saturday entertains the above gentlemen at dinner on board the *Atlantic* steam-ship, now lying in the Mersey, taking the guests down by special train, and bringing them back again. Mr. Sheppard Smith, of Rutland Gate, has kindly permitted Mr. Cole to play the host for him, and invite any one he chose to inspect his valuable collection of paintings, which, as containing examples of modern British art, is rich and rare.

The juries are proceeding very rapidly towards a conclusion, and we are happy to say with more unanimity than could have been expected from the appearances of last week. The Royal Commission, however, grappled with the matter manfully, and promptly determined, reiterated the instructions originally given on which the awards were to be made, amplifying and explaining any portions which might have been misunderstood, and fixing in a most decisive manner the principles upon which the respective adjudications should be made. The effect has been all that could have been hoped for, or, indeed, wished; and we trust that the difficulties and concerns of the gentlemen who have been called upon to make the awards will now be completed at an early period; and that, conscious of having discharged their duties, they will carry with them the hearty approbation of all parties: for this talent, skill, energy, and untiring industry with which many of them have wrought, is worthy of all praise and commendation; for it would not at have been a very unfortunate circumstance had anything occurred to have marred the lasting effects, as a whole, has characterised the intercourse so auspiciously commenced amongst the most eminent men of various countries, in art, science, and manufactures, in the working of these Juries.

NATIONAL SPORTS.

Of the five meetings in the Calendar for next week, Nottingham decidedly has the largest claim on the "sympathies" of the racing public. The list is excellently well filled; there is nothing to clash with it; and we promise those who will run down that way will not return disappointed. The races come off on Thursday and Friday. Stamford will come off on Tuesday and Wednesday, Ilsley on Wednesday; and Abingdon on Thursday.

The fixtures for some of are the Royal Yorkshire, at Whitby, on Wednesday; Bermondsey, on Thursday; and Margate, on Friday.

CRICKET FIXTURES.—Monday, at Lord's, the Oval, and Sheffield. Tuesday, at the Oval. Thursday, Lord's, the Oval, and Sevenoaks. Saturday, at Harrow.

TATTERSALL'S.

MONDAY.—The betting this afternoon was very dull, and the changes confined wholly to the Liverpool Cup, for which Breda beat a retreat, having again put her admirers "in the hole." The prices ranged as follows:—

LIVERPOOL CUP.

7 to 2 agst Officious
9 to 2 —— Rosebrough
8 to 1 agst Marquis
13 to 2 —— Strongbow

GOODWOOD STAKES.

to 1 agst Presto
18 to 1 agst Miss Whip colt

GOODWOOD CUP.

5 to 1 agst Nancy
| 10 to 1 agst Tom Liddicus | 11 to 1 agst Rosebrough
12 to 1 agst War Horse

DERBY.

40 to 1 agst Lapidist
50 to 1 agst Treasure

LIVERPOOL JULY MEETING.—WEDNESDAY.

The CROCKETTE STAKES, of 15 sovs each, and 30 added.—Mr. Wratham's Maid of Masham (G. Abdale), 1. Mr. Mossley's Alonzo (W. Sharpe), 2.

The BICKERSTAFFE STAKES, of 100 sovs.—Lord Clifden's Harpsichord (J. Marson), 1. Lord Glasgow's Miss Whip, 2.

PADDOCK SWEEPSTAKES, of 10 sovs each, and 80 added.—Mr. G. Barton's Bethgelert (J. Marson), 1. Lord Derby's Meanee c. (Flaman), 2.

The SEFTON STAKES, of 30 sovs each.—Mr. E. J. Irwin's The Abbess walked over.

SWEEPSTAKES of 50 sovs each.—Mr. H. Bradshaw's Clasher walked over.

The LANCASHIRE OAKS of 10 sovs each, and 100 added.—Mr. Harrison's Trickteese, 1. Mr. Davidson's Vivandière, 2.

The MERSEY STAKES, of 25 sovs each, and 50 added.—Mr. G. Barton's Bethgelert, 1. Lord Derby's Meanee c., 2.

The PADDOCK STAKES.—Lord Derby's Iris walked over.

THURSDAY.

The FOAL STAKES.—Pandemus, 1. Third of May, 2.

GROSVENOR STAKES.—The Cabler walked over.

THE CUP.

Strongbow	..	..	..	..	1
Abbess of Jervaulx	..	..	..	..	2
Windischgratz	..	..	..	..	3

Ten ran. Won easy.

LAMBETH REGATTA.

The watermen of Lambeth, on Monday evening, contested in a match for a purse of sovereigns presented by the residents. The race was with twelve competitors in three heats, and attracted a large crowd of spectators. The race started from Westminster-bridge, rounds a boat off Barnett's distillery, and rowed down to Hungerford-bridge, returning to Lambeth-stairs to finish.

FINAL HEAT. (The distance was reversed:)—William and Edward Perry (Blue), 1. John Maynard and Joseph Andrews, 2.

The winners got the lead directly after the start, and kept it. Won by four lengths.

THE VACANT GARTER.—It was currently rumoured on Thursday evening in the lobbies of the Houses of Parliament, that the garter vacant by the death of the Earl of Derby would be conferred on Earl Fitzwilliam.

His Grace the Archbishop of Canterbury has recently conferred the degree of Doctor of Music upon Mr. S. S. Puckerman, formerly from Boston, U.S., but now a resident of York, England.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

The following notice has just been issued by the Post-office authorities:—"The steam-vessels which were announced in the month of April last to have been established between Lowestoft and Hjerting or Ballum, having now been withdrawn, no ship letter mails for Denmark will hereafter be made up at Lowestoft."

The remains of Mr. Dyce Sombre were on Tuesday deposited in the catacombs of Kensal-green Cemetery—whence it is expected they will be removed to Calcutta in a few weeks. The deceased was placed upon a stand adjacent to the mortuary chamber, where the Roman Catholic service was solemnly performed by Cardinal Wiseman, and the same observance was practised upon depositing the remains. The mourners on the occasion were Captain Troup, the Baron Bolaroff, Viscount St. Vincent, Hon. E. S. Jarvis, Hon. Captain Carnegie, Carnegie Jarvis, Esq.; William Jarvis, Esq.; Charles Shadwell, Esq.; J. P. Larkins, &c.

The Federal Council of Switzerland has drawn up a decree for the execution of the railways proposed by Mr. Stephenson. One line is to traverse the country from the Lake of Constance to Geneva, passing by Zurich. A branch line is to run from this trunk-line to the Basle Railway to unite with the German and French lines. Another line is to proceed from the Lake of Constance to Coire, in the Grisons, to be prolonged afterwards across the Alps by Luckmanier into Lombardy. The total length of these lines is to be 650 kilometres (406½ English miles), and the expense 102,133,000fr., or 137,112fr. per kilometre.

The remains of the late Earl of Derby were interred on Tuesday morning in the family vault at Bromley church. The funeral was private.

On the motion of Mr. William Williams, M.P., an account of the public money expended on the Royal palaces, parks, &c., from 1843 to 1851, has been published, with a statement as to the salaries and emoluments of the rangers of the different parks. Bushey Park is ranger of Windsor Great Park, and has no salary; but the late Sir W. H. Freemantle, as deputy ranger, had a salary of £400 a year and a lodge. The salaries and emoluments of the rangers of the other parks vary from £74 2s. 4d. to £160 10s. The rangership of Bushey Park, held by the late Queen Dowager, has not yet been filled up. Lady Blomfield, as ranger of Hampton-court, has a salary of £74 2s. 4d. a year.

The valuable sinecure office of Keeper of the Jewel-Office of the Tower has become vacant by the death of General John Sullivan Wood.

The Board of Trade returns of the number of vessels employed in the foreign trade of the United Kingdom during the five months ending June 5, 1851, show a considerable increase on the years 1849 and 1850, a progressive increase in the amount of tonnage entered and cleared, in which increase British shipping will be found to have participated. The returns of the coasting trade are equally satisfactory.

In a vault immediately under the altar in the beautiful church at Hythe is an immense pile of human bones and skulls, which measures 27 feet in length, six feet in breadth, and seven feet in depth. They are neatly and solidly laid to the remains of the Danes and Britons killed in a battle near that place. A party of ladies and gentlemen visiting this singular collection lately, discovered that a robin redbreast, having found admission through the old wall, had built her nest in one of the skulls.

Mr. T. Sother, of Hanover, Virginia (says an American paper), has been sentenced to five years' imprisonment, for whipping one of his slaves to death.

Mr. Creswell, a large Negro trader, died at New Orleans lately, and by will liberated his slaves, 91 in number. Unfortunately for the Negroes, the will is said to be contested.

The cholera is still fatal on the western rivers of the United States, chiefly among immigrants. The weekly deaths by this plague are also numerous at New Orleans, St. Louis, and other river cities.

The following gentlemen having passed their examination in the "Doctrine of Probabilities," and the "Theory and Practice of Life Assurance," have received certificates of competency as duly qualified actuaries (alphabetically arranged); viz. Edward Cheshire, London; Christopher Child, London; Alexander Colvin, London; James Meikle, Edinburgh; and Henry Thomson, Jun., Aberdeen.

Letters from Hungary mention the shock of an earthquake having been felt at Komorn on the night of the 1st inst. It was accompanied by a fearful crashing sound and loud peals of thunder, and lasted half a minute. The church bells were made to ring, and scarcely a house that was not affected in some way. Most of the inhabitants betook themselves to the fields.

The Protectionists of Berkshire have advertised their intention of presenting their requisition to Mr. Vansittart, of Basham Abbey, the object being to return Mr. Vansittart in conjunction with Lord Barrington and Mr. Sibert, Palmer, and consequently to oust Mr. Pusey from the representation of his native county.

On Friday night week, between eleven and twelve o'clock, an alarming fire broke out at a mill at Hurst. The total loss is estimated at between £7000 and £8000, the whole of which sum will be covered by insurances. The premises were occupied by Mr. L. Cooke and Mr. Cooper, cotton-manufacturers; and the mill itself was occupied by Mr. Hesgrethorn, boiler-burner.

Commodore Aulick, of the United States frigate *Susquehanna*, sailed lately from San Francisco for Japan, with full instructions to open a commercial intercourse with that kingdom, if possible. He took with him a number of shipwrecked Japanese. Both California and the other states look with longing eyes towards the Sandwich Islands—the chief *dépôt* and *entrepôt* for American whalers, and the half-way house to Asia.

A third bill of the patent session, to amend the patent laws, has just been printed, by order of the House of Lords. It was brought forward by Lord Granville, who further stated on the 3rd inst. that, as the present bill contains twenty-two clauses and a schedule of forms, it is proposed to appoint commissioners, who may appoint examiners and officers, may make rules, and are to report annually to Parliament. By one of the clauses in this bill, the use of inventions abroad are to have the like effect on letters patent as to the use or publication in the United Kingdom.

The magistrates of Buckinghamshire gave a public dinner last week, at the Quarter Sessions, to their late much-respected chairman, Sir F. Aubrey, Bart., as a mark of their grateful sense of his services during a period of twenty years. Lord Carington presided, and about sixty magistrates, and the barristers who attend the sessions, sat down to a splendid banquet. The worthy Baronet's portrait was placed in the judges' lodging on the occasion.

At the Hants Quarter Sessions at Winchester, on Thursday week, a number of men were indicted for a riot at Ryde on Monday, May the 26th, during the progress of the polling at the election of a representative for the Isle of Wight. After a lengthened investigation, the jury acquitted the whole of the defendants.

Some Jewish capitalists, driven from Russia by late measures against their race, are endeavouring to purchase large tracts of land for the formation of Jewish colonies in Hungary.

The whole of the troops in the garrison at Woolwich, nearly 5000 in number, were reviewed on Saturday by the Marquis of Anglesey and his Royal Highness the Duke of Cambridge. A large party of the nobility were present. At the conclusion of the review, the Marquis of Anglesey and several of the nobility, among whom was the Marchioness of Conyngham, proceeded to the mess-room, where an elegant *dejeuner* was served for 300 persons.

The subscriptions for a free library at Manchester now amount to upwards of £9000.

The *Cologne Gazette* announces that the visit of the Emperor of Austria to Gallicia has been postponed.

The Baron Dudevant, husband of the famous romance writer, George Sand, has just died at a boarding-house in one of the small streets of the 12th *arrondissement* in Paris.

A Parisian charcoal dealer, residing in the *quartier* of the Bastile, on Saturday threw himself from the Column of July, and was killed on the spot.

The annual returns of the Municipal Poor Schools of Berlin show that the large sum of 13,000 poor children received daily instruction, at a total cost of £19,680 sterling, or about 17s. a head per annum, or 4d. per week.

As a farm labourer was gathering sticks a few days ago in the field of the widow Kaiser (Lombardy), he found a gold watch and chain under a heap of rubbish. He conveyed them at once to the Commander of Novara, and that functionary recognised them as having belonged to General Perron, who was killed in the battle. They were given up to the General's wife.

A letter from Stockholm, of the 24th ult., states that the Swedish Government has decided upon sending the corvette *Eugenie* on a voyage of circumnavigation, and invited the Royal Academy of Stockholm to name a scientific committee to accompany the expedition. The Academy, the correspondent adds, has already appointed MM. Skogman, s zoologist; Anderson, a botanist; and Kindal, a physician, to form part of it.

Sir James Graham and Mr. Hinkley (Oxfordshire) have been appointed to the Commission of Inquiry into the Constitution and Practice of the Courts of Equity. These additions have been made at the suggestion of the House of Commons, that two laymen should be added to the Commission, which, on its first appointment, included Sir John Romilly, Sir W. Page Wood, and other members of the Chancery Bar, and Mr. Crompton of the Common Law. Several amendments have already resulted from the inquiries instituted, and a very comprehensive report may soon be expected.

On Wednesday week, says the *Bristol Times*, the lady of the Rev. J. Woodward, whose late secession to the Roman Catholic Church is an event of much unhappy notoriety in this city, was formally received at Clifton Chapel into the new faith of her husband. On the following Sunday the nurse was induced to follow the example of her master and mistress.

On Saturday information was lodged at the head police-office, Scotland-yard, that the premises, 13, Lambeth-terrace, Lambeth-road, had been entered and plundered of a quantity of the most costly description of jewels, set with diamonds, in value upwards of £2500; a Bank of England note for £50; a number of sovereigns and half-sovereigns, forty half-crowns, and two guineas in money.

Another of these sad occurrences—unhappily not unfrequent in mining districts—an explosion, took place on Tuesday week, at the co Bery of Mr. George Dudley, at the Five Ways, Cradley, Worcestershire, while the safety lamp was being used for the purpose of testing the presence of gas. It resulted in the death of nine persons. The bodies of four of Lucas were brought out of the pit quite dead; the others have since died from the effects of the injuries sustained.

MEETING OF THE BRITISH ASSOCIATION AT IPSWICH.

SHRUBLAND PARK, NEAR IPSWICH, THE SEAT OF SIR W. F. MIDDLETON, BART.—ARRIVAL OF PRINCE ALBERT.

(From our own Correspondent.)

THURSDAY AFTERNOON.

At the general meeting on Wednesday evening, Sir David Brewster resigned his presidential crown (to which he has done so much credit) to the Astronomer Royal; on which occasion he read a speech explanatory of the condition of science, and complimentary to his successor. Mr Airy, in his reply, read a retrospective view of the progress of science within the past year, and dwelt especially upon the marked progress made in astronomy by the discovery of three new planets between Mars and Jupiter, the important observations on Nebulæ and Double Stars (one dark attending one light), by means of Lord Rosse's gigantic telescope. On other branches of science he treated more lightly, but altogether in an exceedingly simple and lucid manner. The Bishop of Oxford proposed, and Professor Sedgwick seconded, a vote of thanks to the new President, for this able exposition, and the assemblage, which was numerous and well attended by ladies (a fair proportion being in the costume of the Society of Friends) separated, after hearing from the secretary, Phillips, that above 470 members (including above 100 ladies) had been enrolled.

Thursday morning was ushered in with bells ringing and other signs of holiday, such as flags, triumphal arches, and many houses gaily decorated with flowers and green boughs; and at ten o'clock the committees of sections met and prepared for operations; the presidents being Dr. Whewell, Professor T. Graham, W. Hopkins, Esq., Professor Henslow, Sir R. J. Murchison, Sir J. Rodeam, and W. Cubitt, Esq. At half-past eleven Prince Albert arrived punctually from Sir W. Middleton's, where he had been met by the president, vice-presidents, and officers of the society. He was in an open carriage and escorted by a detachment of Horse Guards, the streets filled with applauding crowds, and the whole scene very animated, the weather auspicious, and the arrangements (as they were in every respect) excellently made by the Ipswich committee. His Royal Highness immediately proceeded to the Physical Section (A), presided over by Dr Whewell, and Colonel Reid was called upon to read his paper on "Mooring ships in revolving gales" which being of infinite value to navigation and seamanship was listened to with great interest. For the conclusion he mentioned an important fact connected with meteorology; viz. that Lord Palmerston had engaged 200 British Consuls, located over the earth, to make him half-yearly meteorological reports, which would furnish data for the desired solution of atmospheric laws. The circular storms which visit the British Isles he traced to their formation in the Atlantic Ocean; and those which affected the Mediterranean and Continent, to Africa. A very ingenious apparatus for making astronomical observations by means of electro-magnetism was exhibited and explained by two young Americans (the inventors being Americans), which marked a revolving cylinder with a record of every second of time. Upon this Mr. Airy offered some remarks, and the Prince, having stayed above half an hour, retired, and was conveyed to

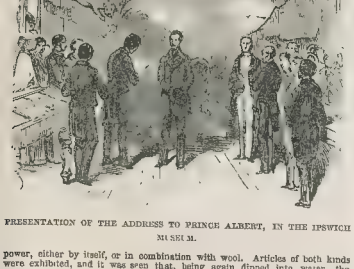
Section B, where Mr W. Grove, V.P., in the absence of Professor Graham, presided. Here M. Dumas, speaking in French, finished a discussion which was in progress, on the growth of plants in various gases, the most remarkable feature in which was that (we believe as yet not completely demonstrated) one half per cent of oxide of carbon would destroy life as far as respiration, a large proportion of carbonic acid. The next communication was made by Dr Playfair, and excited much curiosity both from its novelty and value, as regards manufactures. It was by Mr. Mercer, a large manufacturer of cotton; and "on a new method of contracting the fibres of calico, and of obtaining on the calico thus prepared colours of much brilliancy." Various spe-

VIEW OF IPSWICH, FROM STORE HILL.

MEETING OF THE BRITISH ASSOCIATION AT IPSWICH.

HIS ROYAL HIGHNESS PRINCE ALBERT LAYING THE FOUNDATION-STONE OF THE NEW GRAMMAR-SCHOOL, AT IPSWICH.

cimens were shown, and admirably bore out proof of the qualities ascribed to this fabric. It would be long to describe it fully, but the principal features are, that *cold* water holding soda in solution poured on cotton alters the structure of the material, substitutes a new fabric for the original, and thus, rendering it acid, prepares it to receive a far brighter intensity of colour. What is more it adds to the weight and strength of the fibre and web, and by several processes, in combination with gum, &c., renders it easy to form any patterns of lasting



PRESENTATION OF THE ADDRESS TO PRINCE ALBERT, IN THE IPSWICH MUSEUM.

power, either by itself, or in combination with wool. Articles of both kinds were exhibited, and it was seen that, being again dipped into water, the coarse cotton product was converted into fine fabric by the contraction, and the foundations laid for most important improvements in the manufacture of this world used material. Mr. Grove made a few remarks on the scientific principles chemically involved in this process, and, after some further observations from M. Dumas and Mr. Faraday, the Prince departed to pursue his sectional tour.

We are indebted for the following to the *Suffolk Chronicle*. —

The first section visited was that of Physics, sitting in the council-chamber of the Town-Hall, under the presidency of the Rev. Dr. Whewell. His Royal Highness was much interested with the Daguerreotypes of the moon and other heavenly bodies, exhibited by the Bonds, of Cambridge University, America. He then proceeded to the Chemistry Section, at the Old Assembly Rooms, Tavern-street, sitting under the presidency of Professor Graham. During the presence of the Prince, some account was given by Professor Playfair, in the absence of Mr. Mercer, of the recently discovered powers of caustic soda in contracting the fibres of calico, &c., and by that means strengthening and otherwise improving the fabric. From this section, his Royal Highness next visited the Geographical and Ethnological Section sitting in the Library of the Mechanics' Institution, under the presidency of Sir Roderick Murchison. M. de Hahatchef, of Nice, gave some account of his travels in Western Asia; and Mr. Asa Whitney, of the United States, explained his gigantic plan for making a railway across the continent of North America, from Lake Michigan to the Pacific. To both these communications the Prince paid great attention, and suggested inquiries through the President, which led to further explanations. The last section visited was the Geological Section, at the Temperance Hall, under the presidency of W. Hopkins, Esq., where the stay of his Royal Highness was prolonged by an animated discussion between Professor Sedgwick and Mr Charlesworth, upon papers read by Professor Phillips and Professor Forbes, upon the crag formation of Suffolk.

The Prince proceeded from section to section in his carriage, except to the Geographical Section, which he reached by quitting the Old Assembly Rooms at a door in Tower-lane, and crossing over on foot into the Mechanics' Institution. He was accompanied in these visits by the Mayor, Professor Airy, the President of the British association, the Marquis of Abercorn, Col. Grey, and Col Seymour. The Prince was loudly cheered as he alighted at the different sections.

At three o'clock his Royal Highness, with his suite, alighted at the residence of the Mayor, in Museum-street, to luncheon. His Royal Highness, after luncheon, took his departure for Shrubland.

Shrubland Hall, the seat of Sir William F. F. Middleton, Bart., occupies a commanding site, in the midst of a beautifully timbered park, 300 acres in extent. The property formerly belonged to the descendants of the Lord Keeper Bacon. The mansion was built by the late Sir William Middleton; but it has been greatly enlarged and improved by the present Baronet. The principal alterations have just been completed, by Mr. Barry, R.A. The style is Italian. An open campanile, or bell-tower, has been erected at the south-west angle of the mansion; a balustraded stone terrace, with flights of steps communicating with the lawn, has been erected on the conservatory front, and adorned with marble vases from Italy; but the most important additions made by Mr Barry are a new entrance hall, and a sculpture gallery adjoining.

After the departure of Prince Albert for Shrubland, the Ipswich Horticultural Society held their annual show

In the evening was held the association *conversazione*, the company numbering 900.

On Friday, the Prince arrived from Shrubland a few minutes before eleven, and proceeded to resume his visit to be sections. At the Mechanical Section, the business was opened by the President, W. Cubitt, Esq. The subjects brought under notice were an explanation of an improved direct-action steam-fan, by Mr. Naesmyth, for the more perfect ventilation of coal-mines, and an account of the manufacture of chilled pivots, by Mr. C May, for astronomical instruments. The Natural History Section, presided over by Rev. Professor Henslow, at the Mechanics' Lecture Hall, was the next section visited. Professor Forbes was called upon to communicate his observations on the Molluscs of the Azores and St. Helena, considered with reference to the distribution of life in the Atlantic Ocean, to which his Royal Highness listened with marked attention. The last visit paid by the Prince was to the Statistical Section, at the Literary Institution, Town-Hall; President Sir John F. Boileau, Bart. The subject to which the attention of his Royal Highness was directed was a mathematical exposition, by Dr. Whewell, of some doctrines of political economy.

His Royal Highness next proceeded to the Ipswich Museum. The Prince was received in the entrance-hall by Professor Henslow, President of the Museum; the Vice-Presidents; and Messrs. F W. Johnson and G. Ransome, the secretaries, by whom he was conducted up-stairs into the collection room. His Royal Highness was attended by the Marquis of Abercorn, Colonel Grey, and Colonel Seymour. His entrance was the signal for a general rising, accompanied by other demonstrations of respect and welcome, which the Prince gracefully acknowledged. Arrived at the chair provided for his accommodation, his Royal Highness took up a position on one side of it.

Professor Henslow, the President, then read a congratulatory address; and the document having been received by the Prince, and by him placed in the hands of Colonel Grey, his Royal Highness read a most gracious reply, which he afterwards handed to Professor Henslow.

At the conclusion of the ceremony, the Prince entered his name in the visitors' books. From this point he commenced a regular inspection of the cases in the room, and frequently expressed his gratification with the extent and value of the collection, and with the admirable manner in which it had been arranged.

His Royal Highness then quitted the room, and was shown by the President and Secretaries into the library, down-stairs, where a handsome luncheon was provided by Mrs. Harrison, of the Crown and Anchor Hotel

After leaving the Museum, the Prince proceeded to lay the foundation stone of the new Grammar-School. The site is at an easy distance from the town, looking over the Arboretum and Christ Church Park on the east, and commanding an extensive view of the river Orwell and the rich valley of the Gipping on the south and west. The preparations for the ceremony were in excellent taste At the entrance of the grounds a spacious marquee was erected, festooned with laurels and flowers, and the ground covered with crimson cloth. On both sides was a range of galleries, the supporters garlanded with laurels and roses; whilst from the roof were displayed flags. At the north end a yellow silk flag displayed the motto, "Do wel and dombt not;" the south end exhibiting a blue banner, with the inscription "Agriculture and Commerce." These galleries, with the marquee in the centre, were arranged in the form of a crescent, and displayed all the fashion and beauty of the town and neighbourhood. At the north-east corner of the proposed entrance to the new edifice, the stone was exhibited suspended by pulleys from a framework decorated with laurel. From the roof of this structure waved the Royal standard of silk, beautifully embroidered. Here were assembled the young gentlemen of

TRIUMPHAL ARCH IN TAVERN-STREET, IPSWICH.—PRINCE ALBERT VISITING THE SECTIONS.

the Grammar-School, upon the site of the proposed new school-room, numbering upwards of 120.

The ceremony commenced by the Mayor reading to the Prince a brief history of the Grammar-School.

His Royal H ighness replied, and then advanced to the stone, a block of granite weighing 12½ cwt., and bearing a brass inscription-plate. The plans and a drawing were presented by Mr. Fleury, the architect of the new building; and an impressive prayer was offered up by the Rev. J. S. Bagard. Mr. Fleury then presented to the Prince a massive silver trowel, and the stone was laid with the accustomed ceremony

The Prince, after taking leave of Sir W. and Lady Middleton and other distinguished personages, including the Mayor, the Astronomer-Royal, the Rev. S. J. Ridgard, and W. Cubitt, Esq., left the ground amidst renewed cheering.

On his way to the railway station, the Prince turned aside to bestow a visit upon Sparrowe's House, in the Old Butter-Market; entering the house by Mrs. Fawsey's shop, and examining the interior with much curiosity.

In the evening there was a brilliant display of fireworks on the ground; the band of the Queen's Bays being present.

On Saturday evening last a splendid *fête* was given at Shrubland, by Sir W. F. and Lady Middleton, and was numerously attended. The beautiful grounds, occupying some twenty-five acres of deliciously laid out garden, offered in themselves a treat which we can hardly think inferior to the immortal garden of Armida, where Rinaldo was held captive, as we have compared the occasion to-day. These courteous receptions, also, greatly enhanced their pleasure; and the Association altogether owes a debt of much gratitude to the liberal proprietors of Shrubland.

By Monday morning the trophies of Ipswich in honour of the visit of Prince Albert had disappeared, and with them the great majority of the notable men who had paid a temporary visit to the Association. The engagement of many of them in the business of the Great Exhibition led to this result; and another reason had to be found on the occurrence of a holiday—Excursion Day being appointed for Tuesday—thus making, with Sunday, two successive days without business which brought the assemblage together, and induced a considerable number to return to their homes and avocations.

Before offering a few general remarks on the principal features which it has presented, I may, for the sake of convenience, put in a retrospective paragraph in relation to *Royal Visits to Ipswich*, which have not been so frequent in later as in earlier times, when our warlike monarchs and possessors of territories across the Channel had so often occasion to make the port of Ipswich a point of their way to France or the Low Countries From the days of King John, our Henries and Edwards frequently passed by the Orwell river and Harwich to fight, or meet leaders and friends; and most of these excursions were made in their day with corporate honours and rejoicings somewhat different from those which attended the advent of Prince Albert. Henry VIII. had a purse with 50 marks in nobles presented to him, and his Queen Catharine £20 ! His daughter Mary found powerful supporters in Suffolk, and stopped at Ipswich with 20,000 men on her triumphal march from Framlingham to London. Elizabeth was three or four times entertained here, and her visit to Ipswich reckoned £100 a day. Charles II., James II., and William III. were the last English Sovereigns who partook of the corporate hospitalities of the town; though George II journeyed through it, and had refreshment; and George IV., when Prince Regent was royally welcomed on several occasions, some forty years ago. There was, accordingly, much novelty in the visit of the Prince Consort, and the "oldest inhabitant" alone could put the remembrance of preceding and the interests and charities of the place, and the loyal manifestations of the people were highly creditable to all; and formed, it must be felt, a true English treat in favour of modern times, when compared with a visit, or rather visitation, of Charles II., whose cubers, pages, porters, yeomen, and a whole tribe of hungry retainers, exacted homage fees on the event of his Majesty's arrival (A.D. 1668) to the tune of £79 12s., as appears from the treasurer's account.

Having discharged my antiquarian functions, I may state, that, with regard to the progress of any science, as elicited at this meeting, the three matters of most consequence have been—1. The cotton fibre expansion, briefly described in my previous note; 2. The argument of M. Dumas, founded on experiments, to a certain extent, that atoms now considered elementary may be decomposed, thus making the atomic theory assume to a new dividing of matter, as the old doctrine of elements yielded to the atomic; and 3. A stout battle in geology on the subject of crag formation and the fossil remains belong ng to them or mingled with them. Many opinions were strongly maintained and many suggestions thrown out for the further investigation of the geological problems involved in this question; but, in the meantime, it is impossible to reconcile the discrepancies at issue. It is clear that the crag must be much more carefully examined, and the deposits of the red crag distinguished from those of the coralline, before any certain conclusions can be arrived at. In connexion with this topic, I observe that human-made collections of what are called coprolites (whether truly or not, is undetermined) are met with all along the coasts near the crag, and have become an important article of trade. The substances, where abundant, are stated above 55 per cent. of phosphate of lime, and is calculated to supersede or compete with guano in our agriculture to the full extent of its quantity. The farmers and peasantry have made quite a trade of it; it is ground and sold at the rate of £6 per ton.

Most of the sections were very thin on Monday, and in some there was a scarcity of communications, so that they rose at earlier than appointed hours. Meanwhile, I should say that I do not think the materials for an interesting or sufficient annual volume to have been furnished on this occasion; and I, fear, will not be enriched by the fees taken from new and old subscribers; though Ipswich itself has not flagged in its hospitalities, and George's Friends and their ladies have contributed in meritorious numbers.

On two of the evenings popular lectures were delivered by Professor Owen, "On the nice distinction between plants and animals;" and the Astronomer-Royal, on the approaching solar eclipse of the 28th inst.

On Tuesday the Sections fought hard for a fair finale, and were as successful as could be anticipated. Reports of recommendations made during the week, and all its resolutions were adopted. The President's dinner was attended by above 200 guests, the great majority being the influential inhabitants of Ipswich, including some fifty or sixty of the fair sex, and exhibiting no mean display of East Anglian comeliness and beauty. At eight o'clock the final general meeting took place in the room recently tenanted by Section D. Thanks were voted to the authorities of Ipswich, and Mr. Robert Harrison having ably expressed the grateful feelings of the inhabitants for the honour conferred on them and the instruction they had received from the meeting, the effects of which would be beneficially experienced for generations yet to come, the assembly broke up, and the British Association closed the 21st year of its useful existence.

The meeting at Belfast, next year, is fixed for August.

SCOTTISH FETE IN HOLLAND PARK.

THE usual annual gathering and *fête champêtre* of the Scottish Society was held on Thursday, in Holland Park, Kensington. Lord Ivory, who granted its park at Notting-hill for the purpose of the athletic games, sports, and pastimes, which, though open to all nations, were prohibited by the weather to all but the few who were willing to defy rain and cold in pursuit of amusement. The different games and sports accordingly came off but indifferently. The grass was too damp for the wrestlers, and the platform too slippery for the sword-stick combatants; but the jumping in sacks came off tolerably well; and the music of "Bonnie Dundee" and "Wallace bleed," and other such favourite airs, decidedly exhilarating. The throwing of the hammer, also, either that requisite strength and tact; but the dancing was wanting in the quisite spirit—a fault not to be laid to the account of the reeker, but to the state of the weather already complained of.

DEATH OF AN ARTIST.—We are sorry to announce that Mr. T. S. Bell, late a student in the Government School of Design, who, at the recommendation of Sir Richard Westmacott, R A , was sent out in November last, by the trustees of the British Museum, to act as a draughtsman, under the direction of Mr. A. H. Layard, in carrying on his excavations amongst the ruins of Nineveh, was unfortunately drowned on the 13 h of May last, near Bavian, whilst bathing in the river Gomel, about 25 miles from Mossul.

TOTAL ECLIPSE OF THE SUN.—The approaching eclipse of the sun on Monday, July 28, is the only one that will be total in parts easily accessible from this country for many years to come.

THE POLICE A LEPER.—The Paris *Ordre* says:—"Amongst the persons who have lost by the flight of the *agent de change*, M. Treillet, are the bankers, Messrs. G——; their loss is about 250,000 francs. On hearing of the flight, Messrs. G—— sent off their cashier by railway for England; but on reaching Havre that gentleman was supposed to be the *agent de change* himself; he was accordingly, in spite of his protestations, arrested, and brought in custody to Paris.

EXTRAORDINARY ACCIDENT TO AN EXCURSION TRAIN.—On Tuesday, an excursion train on the Great Western Railway brought up about 1500 passengers from Gloucester, Stroud, and Cheltenham to the great Kensington Fair. This line of railway between Stroud and Chalford runs up a steep incline of about five miles in length, terminating in a tunnel about two miles long, the gradients in which are in some parts as high as 1 in 75 or 80. The train, which consisted of twenty-three carriages, was propelled up the incline with some difficulty by two powerful engines; but, on its emerging from the tunnel on the London side, it was discovered that eleven of the carriages had become detached from the train, and were nowhere to be seen. The circumstance was caused by the breaking of the coupling-chains, and the consequent separation of the train, which could not be followed by the engine, however, was despatched on the down rails to overtake the runaway carriages, and give warning of their approach at the bottom of the incline. Very fortunately, as the pilot engine was proceeding down the incline the mail train was met slowly ascending, and the engine driver having been apprised of the danger, he immediately reversed his engine, and backed his train down the incline, thus allowing the runaway carriages to descend upon him without any serious collision, and both trains arrived at the bottom of the incline in safety. The passengers were greatly alarmed, and two or three of them who leapt from the carriages as they were descending received very serious contusions; but beyond a delay of about three hours in the arrival of the train at Paddington, nothing more serious occurred to mar the pleasure of the excursion.

THE THEATRES.

HER MAJESTY'S.

Scribe and Thalberg's "Florinda; or, the Moors in Spain," was repeated last Saturday night, by command of her Majesty, who visited the theatre in State. an Illustration and notice of which event will be found elsewhere. On Monday "Florinda" was given, for the third time; the Duchess of Kent, accompanied by the Countess Jermingham, being present.

On Monday night the celebrated company of twenty-eight Spanish dancers, who, at the Gymnase Theatre, in Paris, lately created such a sensation, appeared, for the first time in this country, in various national dances. It was a great mistake to have introduced these surprising dancers without some relief in the way of operatic selection. Upwards of three hours of a very peculiar style of dancing, in three-four time, requiring one single movement, a gallop, in two-four, which is not Spanish, accompanied by the never-ceasing castanets, would be too much almost even for the most enthusiastic amateurs of Iberian choregraphy and music. But the exhibition is a remarkable one, and a novel and unprecedented one. We have repeatedly mentioned that our opera frequenters had not the most remote notion of the genuine Spanish saltatory school, from the specimens of boleros, fandangos, and cachuchas presented by the French, Italian, and English dancers. The amateurs in the stalls, present last Monday, were evidently taken by surprise by the performance of the new comers, and if they display their extraordinary combinations for the future, in a *divertissement* of an hour's duration after an opera, the Spanish dancers will be as much relished as in Paris. The marked originality of the dances of Spain has suffered but little variation from their Or ental origin; the showers of the Egyptians, the Hindoo nautch, the Arabian dances introduced by the Moors, and the Spanish have only modified the Eastern versions. The voluptuous dances of the Gaditanas still exist amongst the gypsies in Spain; their grossness and indelicacy has disappeared, but enough remains of the original style to prove the sensual influence. In the Spanish dances, the head and body are as active and supple as the hands and feet of the ordinary ballet. It is a great achievement to perform evolutions without so narrow a circle as possible, to crouch down to the very ground in body gyrations, to balance the arms as a light-rope dancer does his pole, to keep time with the soul-stirring click of the castanets, and to preserve the graceful pose plastique, to develope a serpentine flexibility of every part of the frame; and, in short, to be all action, life, and soul, without the slightest approach to artificial attitudes. In all these attributes there was perfection in the dancers of last night. Such a page, such a rustling of her silken petticoats, such a piquant undulation of body and limbs, such an imperious air of authority, such incessant whirlings and spinnings around the hat or cloak of a cavalier, as appeared to be understood as the peculiar picture of one dog, in a movement of caprice, seemed to move the audience to great enthusiasm. Amongst the examples of nationality the Valencian dance, in the picturesque plaids and Moorish costumes of the dancers of the sexes, were conspicuous. The *bolero* the beating of the heels, the clapping of the hands, the tapping of the drinking cups on the tables, the click of the castanets, the *olés* of the spectators, the *coquetterie* displayed in a *brasero* or balancing action of the hands, tambourine, and castanets, the *bolero* of the *bailarina* with the *bailarin*, the morris dancers of Castile was afforded; but the principal illustrations were those of Andalusia, the true land of the bolero and fandango. On Friday night, the Spanish dancers will be the attraction of Jullien's Concert, at Her Majesty's. El Gondola as the leader of the band, appeared for the second time, after the opera of "Fidelio." Sivori performed two violin pieces at this mixed entertainment. Beside Donna Carmen, the daughter of Rosa was in the ballet. Mlle. Cerrito as *Cherubin* is capricious of a little want of precision in the florid passages, sang as beautifully as when she was first heard in this beautiful opera, which is one of Bellini's finest inspirations. The absolute perfection was Grisi's embodiment. Nothing could be finer than the introduction and the finale of the first act.

On Thursday night, Mozart's great work, "Il Flauto Magico," was produced for the first time at this theatre, and was highly creditable to the classic taste of her Majesty; that this magnificent opera was commanded for the State visit. "Il Flauto Magico," composed in 1791, was only first heard in England at the King's Theatre in 1811, and was then given with signal success, by which it literally suffers injurious limitation. Nothing can, however, be grander than the manner in which Rachel idealises the "various and contrarious" situations of the drama. Deservedly recalled at the conclusion of every act except the first, her efforts were rewarded by the unanimous plaudits of a house even more than usually crowded with an artistocratic audience.

SURREY THEATRE.

The English operatic company prodnced Auber's "Fra Diavolo" last Monday night, with great success. Belle's "Bohemian Girl," Weber's "Der Freyschütz," and Wallace's "Maritana," have been also mounted with good effect; and an English adaptation of Verdi's "Ernani" is in preparation. Miss P. Horton and Miss Poole are the *prime donne*; Mr. Travers and Mr. Charles Romer, the tenors; Mr. Borrani, Mr. Corri, and Herr Kuhnler are the bassi. A good *ripieno troupe* has thus been secured; and Mr. T. Bond, the musical director, is painstaking in the execution of the works, for the beauties in which the Surrey audiences display a quick perception, proving how much art has progressed of late years in this country.

PUNCH'S PLAYHOUSE.

Mr. Hatch produced here, on Monday, an original farce, under the title of "Dearest Anna Maria; a Modern Case of Real Life." Mr. Terry, an excitable spouse, is sorely puzzled by the frequent conferences between his wife and her lady's maid, and, in consequence, suspects that the latter is an amorous captain in disguise. After a long series of mistakes and a good deal of acquaintance, the pistols being loaded with Parr's Life Pills. An explanation then takes place. The lady's hair was prematurely threatened with grey, a secret which she wished to conceal from her husband, who had a penchant for locks raven black, and, accordingly, kept her maid in constant employment to pluck out the intruding grey hairs. The dialogue was lively, and Mr. Tilbury was decidedly amusing in the character.

A burlesque on the subject of Lady Godiva followed, by the authors of the "Princesses in the Tower." Miss Marshall played the heroine with great spirit. The scenery was well painted, and the house was numerously attended.

MARYLEBONE.

It is not frequently, owing to its distance, that we visit this theatre. The announcement, however, of "four new pieces" "generated as a novel motive. The first piece will indicate their character; viz. "Show Folks; or, Punch and his Dog Toby," "The Silent Woman," "Park Chops," and "The Bloodhound." Here is the farcical and the melodramatic in the most popular and vulgar form. The first piece opens with a scene in the old style of a cattle show. Mr. Conyngham Doe Hector assumes the part with remarkable intelligence; and Mr. George Wild, whose inspirations seem to preside over the management, personates the proprietor of the French and Italy show, under the name of *Peter Pandean*, and gives assistance to a proscribed rebel, *Randal Randolph* (Mr. Taylor), a fugitive after the battle of Culloden, in which assistance the negro is an important agent. The jocund efforts of *Punchini* and *Toby* succeed in saving the Government victim from the machination of the villain, *Hackley Hall* (Mr. Conyn), and in the end *Randolph* obtains a free pardon. The house was full, numerously and respectably attended on the occasion.

On Monday week, we understand that Miss Edith Heraud will make her second appearance at the Richmond Theatre. On that occasion she will perform the part of Miss Sheridan in the comedy of the "Hazelhack," the part of *Master Walter* being supported by Mr. Marston.

ROYAL MILITARY ASYLUM, CHELSEA.—The owners of the Chinese Junk having invited the boys of this school to inspect the curiosities on board that vessel, the authorities of the establishment have given their consent to attend on Monday next, when a juvenile *fête* is to be given upon a novel scale, and a balloon ascent will take place from the deck of the Junk. The military band of boys will perform several popular airs and overtures on board the Junk in the course of the day.

ROYAL POLYTECHNIC INSTITUTION.—Dr. Bachhoffner has just commenced to deliver a highly interesting lecture at this establishment. On the forthcoming total Eclipse of the Sun," which will take place on the 28th of this month. After explaining the difference between total, partial, and annual eclipses, the doctor called attention to the course which the eclipse would take over Europe, and showed, by a map, how it commences in Norway and terminates near the Caspian Sea, explaining at the same time that in Great Britain the eclipse would be but partial.

CONSUMPTION OF ARDENT SPIRITS.—It is shown by a parliamentary return that the increase of spirits for home consumption in Ireland in the quarter ending the 5th of April last, compared with the corresponding period of last year, numbered 67,211 gallons, the additional duty being £7068 2s. 8d. On the 5th of April last there were 238 persons confined in gaols for illicit distillation.

MUSIC.

ROYAL ACADEMY OF MUSIC.

The fourth and last of the annual series of concerts for the exhibition of the students took place on Saturday, at the Hanover Rooms. There were two new overtures, one, "Cymbeline," by Mr. Banister, Associate; and the other, a concert one, by Mr. Cusins, King's scholar—both creditable compositions as regards treatment, but deficient in marked ideas. There was also a song by J. Nunn, student, "The Withered Heart," sung by Miss Freeman, rather overscored, but displaying sentiment. A selection from Mr. Macfarren's "Sleeper Awakened," sung by Miss L. Baxter, Mr. Swift, and others, confirmed all persons' impressions as to the strong dramatic character of that production, which ought to find its way to the stage, and is well worthy of the attention of managers. Amongst the other full pieces were a selection from Spohr's "Faust," and Mozart's "Costan tinti," and a madrigal by Nicholson, "Spring comes again" (1600). Solos by Maitland, Meyerbeer, Mozart, Donizetti, Gluck, Vaccai, Weber, and Rosslni, were sung by Miss Isabel Ockley, Miss Marshall, Mr. Blake, Miss Browne, Miss Mary Rose, Miss E. Trickett, Miss B. Youngs, Mrs. Hancock, and Miss L. Lew; and the general impression produced by the vocalisation was, that the Academy is gaining ground in its system of tuition, more attention being remarked in the dramatic expression than formerly.

The solo instrumentalists were Mr. Aylward (violoncello), Miss Parker (piano), Mr. Hay (cornet), and Mr. Drummond (violin). These several displays proved that the fame of the institution, for the production of first-rate executants on every instrument, will be fully maintained by the present students.

Mr. C. Lucas was the conductor, and M. Sainton the principal violinist. The concert afforded general gratification to a very numerous and fashionable assemblage. The Earl of Westmorland, the founder of the Academy and chairman of the committee of management, was present; and the prizes and certificates given on Saturday by the professors and pupils, as well as the general company, indicated his popularity here as well as in Berlin, as an accomplished amateur, the true friend of art and artists

MISS KATE LODER'S MORNING CONCERT.

This eminent pianist and clever composer had a morning concert, last Saturday, at the Queen-Anne-street Concert Rooms. Her last concert was her first appearance in public, and her success, consequently, was admirably interpreted by Ernst, Mr. J. Day, Mr. Dando, and Mr. Hancock. The quintuor amply confirmed all previous impressions as to the music-like attainments of Miss Kate Loder, who played in Mendelssohn's trio in D minor, and performed one of her own charming melodies. Miss Catherine Hayes sang with profound feeling a clever ballad by Macfarren, "The lonely One;" and Miss Dolby gave Mr. F. Mori's ingenious air, "Life's Seasons," delightfully.

MUSICAL EVENTS.

Mdlle. Elise Kreintz, the accomplished pianist from Paris, gave a *matinée musicale* on Monday, at the Queen-Anne-street Concert Rooms, assisted by Mdme. Parish Alvars (harp), M. Leon Reymer (violin), and M. Rousselot (violoncello). Miss Catherine Hayes, Mdlle. Grunmann, Miss Binckes, Miss Cr. Fraser, Herr Reichart, Signor Marchesi, and Mr. Augustus Braham; Mr. Lavenu and M. Frelon were the accompanyists. Mdlle. Kreintz performed Bilse's "Amaranth," a charming composition; Beethoven's Sonata in C sharp minor, and the trio in G, also by Beethoven, for harp, violin, and violoncello; and Mr. Lavenu and Mr. Frelon were the accompanyists. Miss Catherine Hayes, who is qu te the star of the concert season, was in beautiful voice.

Madame Sala gave a morning concert last Monday at Wli.s's Rooms; and Mr. John Parry presented his Entertainment, in the evening, at the Music Hall.

The eighth and last meeting of the Musical Union, on Tuesday, at Willis's Rooms, concluded a brilliant season, during which Mr. Ella, the director, has engaged Ernst, Sivori, Sainton, Laub, Deloffre, Watson, Wit, Vieuxtemps (violin); Hill, Webb, and Mellon (viola); Piatti, Seligmann, Pilet, and Menter (violoncello); Bottesini (contrabasso); Halle, W. S. Bennett, Goffelli, and Pauer (piano); Eckert (accompanyist), Mr. Johannsen and Herr Reichart (flute). He also played on Monday, at Johannsen and Herr Reichart (flute). He also played on Monday, at Willis's Rooms, and performed one of her own charming melodies. Miss Catherine Hayes sang with profound feeling a clever ballad by Macfarren, "The lonely One;" and Miss Dolby gave Mr. F. Mori's ingenious air, "Life's Seasons," delightfully.

CHESS.

TO CORRESPONDENTS.

A B. Denbigh.—In the match alluded to, which consisted of twenty-one games, the French player was defeated by a large majority

D. M. Moffat.—Not made in four moves.

ANDREW HARA.—The manufacturers of the "Staunton Chess-men" are Messrs Jaques, of Hatton Garden. You may obtain them through any fancy repository, or walking-stick warehouse.

M. A.—We can see no mate but probably the diagram, which is scarcely legible, is inaccurate. Try no-adding more Rks a real end game. No one will look at such positions as that in question.

PHILO-CHESS.—An admirable book on end games, by Horwitz and King, is published at the office of *The Chess-Player's Chronicle*, 21, King William-street, Charing-cross

CANTERBURY.—The few vacancies for members of the St. George's Chess Club are being rapidly filled up. Send your name and address to 4, Loughborough, Jun., secretary, 5, Cavendish-square

W. B. Lowcock.—We have not before had leisure to examine your proposed solutions of some of the finest games in Kling and Horwitz's new work. In diagram No 111, page 119, you seem clearly to shew that White, instead of a very drawing game, may win; and in diagram No 10 page 38, that White may mate in two moves less than the authors prescribe

WELL WISHER.—Mr. Staunton's health is still very much shattered, and was unable to obtain leave of absence. We are gratified to learn, however, from Major Jenkins, that the celebrated Mr. Metcalf will be at all probability arrive in London early in August

SOLUTIONS OF PROBLEM No 384, by Mentor, Torrington, Dame Rancho, Philo-Chess, Well-wisher, Rev T M P, Rev R G, P R S, a Sailor, Bombardier, Worthy Weaver, D D, Judy, Vale, are correct

SOLUTIONS OF PROBLEM No 385, by R R, of Ashford, Stevens, M D, Mentor, Absens, are correct

SOLUTION OF PROBLEM No. 386.

WHITE.	BLACK.	WHITE.	BLACK.
1. Q to Q5th	R to Q Bsq, or (a, b, c, d)	3. Q to Q 7th	R takes Kt
2 P takes P	1. to K 3d	4. P mates	

WHITE.	BLACK.	WHITE.	BLACK.
(a)	K to K 5th	3 Q to Q sq (ch)	R to K 2d
	2 P takes P	4 Mates	
(b)	P takes P	3. Kt to Q 5th	R to K 2d
	2 Q to K 5th	4 Q to Q 7th Mate	
(c)	R to K 5th	3 Q to Q 8th (ch)	R to K sq
	2 Q to Q 6th (ch)	4 R to Q 7th. Mate

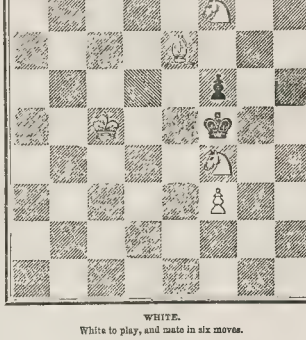
	2. Q to B 5th (ch)	4 Q to B 8th—Mate	

* But how, Mr. King, if Black play *R to Q 3d*, will you mate next move?

PROBLEM No. 390

Presented by VON GATHM, from Aleppo.

BLACK.



WHITE.

White to play, and mate in six moves.

THE CHESS TOURNAMENT.

The conclusion of the last series of games in the general contest was fully looked for this week; but, owing to an unexpected delay in the match between Mr. Horwitz and his competitor, another week will probably elapse before all are finally ended. Up to the time of our writing, in the en-counters now in progress, Mr. Staunton has scored three games to one against his opponent, Mr. Williams; and Mr. Anderson has done the same against Mr. Wyvill. Upon the termination of these proceedings, we are promised the exciting spectacle of a match by consultation, three picked players on each side; and this, if the health of Mr. Staunton is sufficiently restored, it is supposed will be followed by the most interest ng event of all, namely, a grand match of 15 or 21 games, for 100 guineas a side, and the honours of the championship.

GAMES IN THE CHESS TOURNAMENT.

The following brief but beautiful game was the first in the duello between Messrs. ANDERSSEN and WYVILL:—

(Sicilian opening.)

WHITE (Mr. A)	BLACK (Mr. W.)	WHITE (Mr. A.)	BLACK (Mr. W.)
1. P to K 4th	P to Q B 4th	14. Q to K Kt 4th	Kt to K B sq
2. K B to Q B 4th	Kt to Q B 3d	15. Kt to K B 3d.	K B to his 3d
3. Kt to Q B 3d	P to K 3d	16. Q Kt to K 4th	P to Q Kt 4th (b)
4. P to Q 3d	Kt to K 4th	17. K B P takes P	Q to K 2d
5. Q B to K B 4th	Kt takes K B (a)	18. Kt takes B (ch)	Q takes Kt
6. P takes Kt	P to Q R 3d	19. R to Q 6th (d)	Kt to K 3d
7. P to K 5d	Kt to K 2d	20. P takes Kt	Q P takes P
8. Castles	Kt to K Kt 3d	21. K R to Q sq	Q B to Kt 2d
9. Q B to K Kt 3d	K B to K 2d	22. Q R to Q 7th	B to Q B 3d
10. P to Q B 4th	Castles	23. B to K 4th	B takes Kt
11. P to K B 5th	K B to K Kt 4th	24. Q to K t 3d (e)	Q to K Kt 3d
	(ch)	25. Q takes B	P takes P
12. K to Kt sq	K P takes P	26. Q takes Q R	
13. P takes P	K R to K sq	And Black surrenders.	

(a) Better, perhaps, to have played Kt to K Kt 3d.
(b) It seem's man are decidedly cramped
(c) Fine, y played. (d) W nning a piece at once. (e) All this is in the best style.

CHESS IN THE METROPOLIS.

Lively specimen of the Evans Gambit, between Mr. STAUNTON and Mr. MAIR.

(Evans' Gambit.)

BLACK (Mr M.)	WHITE (Mr S.)	BLACK (Mr. M)	WHITE (Mr. S.)
1. P to K 4th	P to K 4th	17. B takes Kt (ch)	K takes B.
2. Kt to K B 3d	Kt to Q B 3d	18. Q P takes K P	Q B to K 4th
3. B to Q B 4th	B to Q B 4th	19 Q to her Kt 3d	B to K 2d
4. P to Q Kt 4th	B takes Kt P	20 K R to Q sq	R to R sq (b)
5. P to Q B 3d	B to Q B 4th	21. K t to Q 3d	Q to her B sq
6. P to Q 3d	P to Q 3d	22 Q to her sq	B takes Kt
7. P to Q 4th	P takes P	23. R takes R	Q to K 3d
8. P takes P	B to Q Kt 3d	24 Q R to Q B 4th	Q R to Q B sq (c)
9. Q to K R 3d	Kt to K B 3d	25 Q to Q 4th	Q Kt to Q sq
10. Kt to K B 3d	P to K R 3d	26. R takes R	R takes R
11. P to Q R 4th	P to Q R 3d	27. Q to Q Kt sq	Kt takes K P
12. Q B to Q R 3rd	Castles	28 Q takes Q Kt P	Q to K B 3d (d)
13. P to K 5th	Kt to K N 2d	29. R to K R 5th	R to Q 8th (ch)
14 Q Kt to Q 5th (a)	B to Q K 2d	30. K to R 2d	Q to K B 5th (ch)
15. Q R to Q B sq	R to K sq	31. P to K Kt 3d	Kt takes Kt (ch)
16. B to Q 3d	P takes K P	And Black resigned.	

(a) Mr Mayet conducts the attack here with a good deal of ingenuity
(b) Apprehension of danger prevents him Black's threatened check with the Kt
(c) R to Q sq would perhaps be better; if Black then took the Kt he would lose a Rook, by White taking R. R with Rook, &c
(d) This decides the game. Fay as Black may, he must lose.

White plays, and mates in five moves.

COUNTRY NEWS.

STRIKE AMONG THE COLLIERS OF NORTH STAFFORDSHIRE.—There has been a turn-out of the men employed in the coal-pits of Earl Granville, to the number of 900. The coal and iron trades have been seriously depressed for some time past, and a reduction of wages has been in com-mence expected. Mr. Lancaster, the agent to the noble Earl, proposed, it is said, to reduce the wages about sixpence per man per day, and to introduce some fresh regulations in the colliery, which the miners conceived to be oppressive, and hence the present contest. Two pits only have stopped work at present, but it is feared that the strike will become general, as the other masters of the district are supposed to be meditating a similar course. The potters, who are very busy, deal with some anxiety on the aspect of affairs, as their interests are bound up in the speedy settlement of the contest. They are large coal consumers; and if the supply of that necessary article is stopped, their ovens cannot be kept at work, and the whole manufacture is interfered with. No acts of violence have been committed, but the miners are parading the adjacent pottery towns, and vent their indignation in no measured terms. A detachment of Light Dragoons entered Hanley on Saturday evening.

SEIZURE OF COLLEGE PLATE FOR POOR-RATES.—The parish officers of St. Aldate's, Oxford, in pursuance of a distress warrant granted by one of the city magistrates, made a seizure on Friday week of two silver teapots, the property of the Master and Fellows of Pembroke College, who had refused to contribute the sum of £11 charged upon the college towards the supp rt of the poor. The ground of refusal to pay the rate is that the college is extra-parochial. A similar seizure was made a short time since of the plate belonging to New Inn Hall, but it was shortly afterwards redeemed by the Rev. Dr. Wellesley (principal of the hall). Subsequently, modes of action for an illegal distress was served upon the parish officers of St. Peter-le-Bailey, where the hall is situated. It is expected in the present case that the college authorities will adopt similar proceedings, if the prizes are determined upon by the guardians as to the liability of the colleges to help to support the poor of Oxford; they contend that the colleges are not extra-parochial.

HUNGARIAN REFUGEES.—The Peninsular and Oriental Company's Steamer *Ripon*, Captain Evans, arrived at Southampton on Monday. Among the passengers by the *Ripon* were 130 Polish and Hungarian officers and men from the Dardanelles. Three of the officers were generals Bulharyn and Idziekowski, and the Polish Bishop Kaczkowski. The latter of whom fought with the patriots in both the Polish and Hungarian revolutions. Idzikowski led the Polish division in the Hungarian war, and was the bosom friend of Kossuth. Kossuth wrote a farewell letter to him on the eve of his departure. It was written in French, and was dated from "Kutalyis, Asia Mineur, 7 Mai, 1851," and was addressed to "My master and esteemed friend." The letter breathed the tenderest and most pathetic emotions, and was evidently written with a trembling hand. Idzikowski and his compatriots were 4 hundred from Kutayah at the same time as Massaros; but they refused to leave Turkey, even to go on board an English steamer, until they had a guarantee from Sir Stratford Canning that they should be secured from Russian and Austrian treachery. During their stay in Turkey they received letters from the Kutayah captives stating that the rigour of the captivity had been increased. The Turkish government had, however, solemnly promised that Kossuth, Perczel, Batthyany, and the Polish General Wysocke should be released on the 15th September next.

THE NEW ACT FOR THE BETTER PREVENTION OF OFFENCES.—On Monday the new act for the better prevention of offences, which received the Royal assent on Thursday week, was printed. There are sixteen clauses in the act, making some important alterations in the criminal law of the United Kingdom, with the exception of Scotland, and they have immediate operation. Among the provisions is one declaring that if any person shall be found by night armed or disguised with intent to break into a house to commit felony, he is to be deemed guilty of a misdemeanour, and liable to three years' imprisonment, with or without hard labour." With respect to "chloroform," it is enacted, if any person shall unlawfully apply or administer, or attempt to administer to any person chloroform, laudanum, or other stupifying or overpowering drug, &c, with intent to commit or assist in committing a felony, every such offender to be guilty of felony, and liable to transportation for life, or imprisonment with or without hard labour for three years. The measure was prepared by Lord Campbell.

MORE MILITARY RIOTING IN LIVERPOOL.—No sooner had the 91st Regiment been removed from Everton Barracks.—some being sent to Manchester, and others to Bury and Preston—than the 79th Regiment occupied their places, and, it would seem, adopted their feelings of hostility to the police. On two successive evenings this week collisions have taken place between the two forces. Policeman 17 B was attacked most brutally by a soldier of the 79th, and, when assistance arrived, a general *mêlée* between the soldiers and police took place. By great forbearance the police succeeded in preventing any dangerous results from this violence until a picket from the barracks had been procured, into whose custody the soldiers were consigned, and they will be dealt with by the military authorities.

COLLISION ON THE GREAT NORTHERN RAILWAY.—On Tuesday evening an accident occurred to the Great Northern 4.10 p.m., express train, just as it was leaving the station in Wellington-street, Leeds. Before the train gets upon the main line it has to ascend a steep incline; and when about halfway up this incline a luggage train belonging to Leeds and Selby Company, who have a goods warehouse here, came down the incline, and whilst at a considerable speed ran into the Great Northern train. A fearful collision took place, and several persons were thrown violently to the ground. The engine, as usual, was at the tail end of the train, backing it out of the station, and therefore the carriages received the full shock. The guard jumped out of his van, which was first, or probably the whole of the train would have been dashed to pieces. J. W. Overend, Esq., and a few other gentlemen received wounds, but none of the passengers had any limbs fractured. The blame rests, it is supposed, on the driver of the Leeds and Thirsk luggage train, who ought to have remained at the top of the incline until the Great Northern train had shunted out of the station.

RACING ON THE ATLANTIC.—The United States mail steam-ship *Pacific*, Captain Nye, left the Mersey on Wednesday afternoon, at four o'clock, for New York direct, having on board the mails for the United States, Canada, Newfoundland, &c. The fixed to meet the owners of the vessel and her friends to the speed of their several voyages, has given rise to much discussion in Liverpool, and has led to many wagers. On the last voyage to the port Captain Nye ran the *Pacific* inside the Skerries, to save time; a course which was followed by some of the most eminent nautical men to have been dangerous, and that a steamer of 100 tons, at li ast so large a ship as the *Pacific*, ought not to have been taken through these shoals.

THE CIVIC ENTERTAINMENT.—The Right Hon. the Lord Mayor received a communication on from Lord John Russell on Thursday evening, conveying her Majesty's most gracious approval of all the arrangements of the civic entertainment at Guildhall, on Wednesday last, and announcing the fact, that her Majesty had been p eased to confer upon his Lordship the dignity of a Baronet of the United Kingdom, in token of the Royal appreciation of the hospitality prevailed over by the Corporation.

THE EXETER DIOCESAN SYNOD.—It is proposed to commemorate the Diocesan synod, lately held in Exeter, by raising a fund in aid of the erection of the new Diocesan Training College of that diocese. The subject has been taken up warmly by persons of influence.

THE LATE CONFLAGRATION IN SOUTHWARK.—On Tuesday morning the coroner's jury re-assembled, at the Bridge House Hotel, London-bridge, for the purpose of further inquiry into the circumstances of the supposed incendiary fire at Mr. Alderman Humphery's wax houses, Montague-close, London-bridge, but nothing material was elicited. They agreed to the following verdict:—That in the absence of direct evidence the cause of the fire is insufficient to warrant any decided opinion as to the origin of the fire in wardsn-st., but that there appears to be the highest degree of probability that the fire in warehouse 14, conversing as it did at the eastern corner, and directly against the wind, is not the result of accident."

PROSPECTUS OF PORT PHILIP (AUSTRALIA).—The merchant ship *Stelcnieth*, Captain John Sergeant, from Port Philip, February 21, landed passengers at Plymouth on Saturday last. Her entire list included Mr., Mrs., two Misses, and Master Sears; Mr. and Mrs. Goodman, and three c. l dren; Mr. Hick, Mr. Betts, Mr. E. M. C. and Mr. W. Ke r; intermediate, Mr and Mrs. Twist, Mrs. Aitkinson and five children, and Mr. and Mrs. Norwood, and two steerage passengers. Several of these have realised handsome competences in Port Philip, and do not intend returning.

THE QUEEN'S STATE VISIT TO HER MAJESTY'S THEATRE.

THE Queen went in State, on Saturday evening, to Her Majesty's Theatre, to honour the performance of "Forinda" with her presence. The Royal *cortège* left Buckingham Palace at twelve minutes before eight o'clock in the following order:—

The first carriage, containing three gentlemen ushers, Sir William Martins, Sir Frederick Smith, and Colonel Diggle; and the Exon of the Yeoman Guard in Waiting, Captain Phibbs.

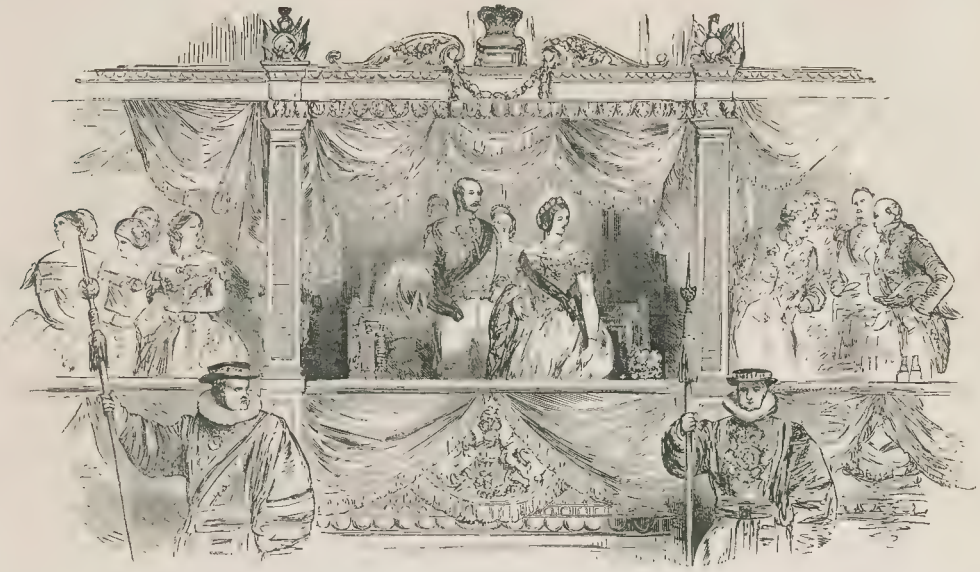
The second carriage, containing the Silver Stick in Waiting, Colonel M'Dougall, the Field Officer in Waiting, Colonel Bentinck, and the Pages of Honour in Waiting, Mr. George Gordon and the Hon. W. Forbes.

The third carriage, conveying the Equerry in Waiting to the Queen, Lord Charles Fitzroy; the Equerry in Waiting to Prince Albert, Lieutenant-Colonel Francis Hugh Seymour; the Groom in Waiting to the Queen, Mr. R Ormsby Gore; and the Groom in Waiting to Prince Albert, Lieutenant Colonel Francis Seymour.

The fourth carriage, conveying the Bed-chamber Woman in Waiting, the Viscountess Forbes; the Clerk Marshal, Lord Alfred Paget; and the Treasurer of the Household, Lord Marcus Hill.

The fifth carriage, conveying the Maids of Honour, the Hon. Eleanor Stanley and the Hon. Caroline Cavendish; and the Vice-Chamberlain, Lord Edward Howard.

The sixth carriage, conveying the Maids of Honour in Waiting, the Hon. Amalia Murray and the Hon. Lucy Kerr; the Lord in Waiting to the Queen, the Earl of Morley; and the Captain of the Yeoman Guard, the Marquis of Donegal.



THE QUEEN'S STATE VISIT TO HER MAJESTY'S THEATRE.—THE ROYAL BOX.

The seventh carriage, conveying the Lady of the Bedchamber, the Viscountess Jocelyn; the Gold Stick in Waiting, Viscount Combermere; and the Groom of the Stole to Prince Albert, the Marquis of Abercorn.

The eighth carriage, conveying the Lady of the Bedchamber in Waiting, the Viscountess Canning; the Lord Steward, the Marquis of Westminster; and the Lord Chamberlain, the Marquis of Breadalbane.

The ninth carriage, conveying her Majesty the Queen, his Royal Highness Prince Albert, the Duchess of Norfolk (officiating for the Mistress of the Robes), and the Master of the Horse, the Duke of Norfolk.

Her Majesty's escort to the Theatre was a detachment of Life Guards.

The whole of the route taken by the Royal procession was lined by spectators, a large number of whom were ladies, and it required the exertions of a numerous body of police to preserve the carriage-way clear for the royal *cortège*. In the immediate neighbourhood of the Opera House the crowd was extremely dense, and for nearly an hour before the doors were opened, the pit and gallery entrances were besieged by a mass of eager and anxious visitors, who endured the heat and pressure with unexampled patience and good temper. Here also there was a numerous police force stationed to preserve order in the dense masses who occupied both sides of the street, while a guard of honour of the Foot Guards was stationed at the Royal entrance and in the vestibule, to receive her Majesty.

The arrival of the Royal party was the signal for a hearty burst of cheering from the assembled multitude.

Her Majesty was received at the Royal entrance by the director of the Opera, Benjamin Lumley, Esq., and by Captain Robinson, of the Hon. Artillery Company, the treasurer of the establishment. The Lord Chamberlain preceded the Royal party with wax lights, in massive silver sticks, in his hands, walking backward. Her Majesty then passed rapidly up the stairs, which were profusely decorated with flowering plants in full blossom, and evergreens of the richest description, to the tiring-room, whence, having been divested of her carriage costume, she proceeded to the Royal box. Within the theatre the preparations for the reception of her Majesty were on a scale of unusual splendour, and were characterised by the usual good taste that distinguishes the management of this house. The Royal box was lined with white and blue silk in alternate stripes; and the large boxes on either side belonging to her late Majesty the Queen Dowager, and his Royal Highness the Duke of Cambridge, were added as wings on either side, and included in the general decorations. The front was hung with alternate festoons of crimson and blue velvet, bordered with gold fringe. A richly gilt and decorated moulding ran along the top, in the centre of which was placed the crown; the pillars on either side were also gilt, and surmounted by gilt shields and armorial bearings; and on the front panel, on a medallion, was displayed the Royal arms. A large bouquet of rare exotics, and handsomely bound books of the opera, were laid in the Royal box for the use of her Majesty and the Prince. Two of the yeomen in their state dresses and halberts were, as usual, stationed in front. As soon as the Queen made her appearance in front of the box, a burst of cheering broke forth from all parts of the house—boxes, pit, and galleries joining heartily in the enthusiastic demonstrations of loyalty. Simultaneously with the entrance of the Royal party a brilliant flood of light suddenly poured into the house from the large chandelier, all the audience rose, the orchestra struck up the National Anthem, and the curtain rising displayed the whole of the *corps dramatique* grouped on the stage. Her Majesty bowed repeatedly. The National Anthem was sung, and a round of cheering followed each verse.

All the ladies of the Royal suite were in full evening costume, and the noblemen and gentlemen in military, naval, or official uniform, and wearing their orders and decorations. Most of the audience were also in full dress or military costume; and the high character of the assemblage, with the vast and richly decorated theatre, presented a *coup d'œil* which for grandeur and elegance has seldom been surpassed. Her Majesty, who looked in her usual excellent health, wore a light blue satin dress, trimmed with deep lace; a head-dress, composed of a wreath of wild blush roses and foliage interspersed with diamonds; a necklace, stomacher, and earrings of large brilliants, and the ribbon of the Garter across her shoulder. The Prince was attired in a field-marshal's uniform, and wore the insignia of the Garter and other decorations. The ladies of the Royal suite occupied the box on the right of her Majesty, and the gentleman the box on the left. Two other boxes on either side were also filled by members of the suite and pages. It is needless to say that the house was crowded in every part, and we understand that three or four guineas were in many instances paid for a single stall. The last act terminated precisely at a quarter past eleven o'clock; and the moment the curtain fell her Majesty rose, bowed two or three times to the audience, and retired. Loud and repeated cheers again broke forth from all parts of the house, and the National Anthem was again sung by the whole of the company.

Her Majesty was conducted to her carriage in the same state as upon her arrival, and, notwithstanding the immense crowds assembled outside, the carriages were, by the great exertions of the police, drawn up in rapid succession, and before half-past eleven the Royal *cortège* was again on its way back to Buckingham Palace.

SCENE FROM SCRIBE AND THALBERG'S "FLORINDA;" OR, THE MOORS IN SPAIN," AT HER MAJESTY'S THEATRE.

MARSHAL has painted one of the most beautiful scenes in the new opera, in the moonlight view of the Convent of Saint Irene. Our artists depict a most striking situation, during the finale of the second act, when *Rodrigo* (Calzolari), disguised as *Ben Amet*, and his companions, drag off *Florinda* (Mdlle. Sofie Cruvelli) in the presence of the affrighted nuns and monks.

SCENE FROM SCRIBE AND THALBERG'S NEW OPERA OF "FLORINDA," AT HER MAJESTY'S THEATRE.—(SEE PRECEDING PAGE.)

THAMES WATERMEN'S REGATTA.—"THE CHANCELLOR'S," NEAR HAMMERSMITH-BRIDGE.—WHERRY FOR PRESENTATION TO THE PRINCE OF WALES

NEW SCHOOL-ROOM, FOREST OF DEAN, GLOUCESTERSHIRE

We have had the pleasing task, on a previous occasion, of illustrating the interest felt by the poor of the Forest of Dean, in the county of Gloucester, for increased accommodation in attending the services of religion; but a more touching instance of this feeling has seldom been presented than in the opening of a School-Room licensed for the purpose of Divine worship, until, by the liberality of a Christian public, a church can be erected.

For some time past, by the indefatigable exertions of the Curate, the Rev. W Malpas, by the blessing of God, the poor foresters have been in the habit of attending, to the number frequently of 160, a service on Wednesday and Sunday evenings in the Curate's house. Respecting this, however, from the wear and tear of the furniture, &c., the poor themselves began to feel a delicacy; and, consequently, to the number of 400, joined in a requisition to obtain a suitable place of meeting: at length—in a great measure by their own voluntary contributions, one carpenter contributing £5 in labour, and a mason the like sum, and so on—a neat building has been erected on Viney Hill.

The site is a grant from Government, and the spot one of the most picturesque and romantic in that most interesting neighbourhood. The Rev. H. Poole is the incumbent of the parish; and the opening, at which a great number of the clergy were present, was solemnised by three services—in the morning by the Rev. Canon Morgan, Rural Dean; in the afternoon by the Rev. Mr. Chute, of Frampton-on Severn; and in the evening by the Rev. John Tucker, of Hawling, when the sum of £40 was collected.

It is earnestly hoped that before long a church will be built, as even the present building is utterly inadequate to meet the increasing wants of these anxious foresters.

NEW SCHOOL, FOREST OF DEAN, GLOUCESTERSHIRE.

THE THAMES WATERMEN'S NATIONAL REGATTA.

The Regatta, which for some seven or eight years was contested at Putney, having been discontinued, and the Thames watermen being anxious to show their skill in rowing before our foreign visitors, it was determined to have a regatta this season; the prizes to be contended for by watermen plying between Windsor and Gravesend. The course selected was that over which the races at the Thames Regatta were rowed, viz. from Putney Bridge to Chiswick Ait, with the addition that at the latter place they were to turn round a buoy moored there, and row down to "The Chancellor's," below Hammersmith Bridge. The races, which were under the patronage of Prince Albert, commenced on Thursday last, and were continued the next day. The following were the sports:—

Apprentices' Match, for a silver badge, coat, and freedom: won by G. Robins, of Battle-bridge; R. Savage, of Horseydown, being second, and R. Piner, of Whitehall, third. Four heats were rowed.

Scullers' Match by Watermen for a prize wherry given by Prince Albert: won by W Pocock, of Lambeth; F. Lett, of Lambeth, being second, T. Goodrum, of Vauxhall, third, and H Piner, of Whitehall, fourth. Three heats were rowed.

Amateur Scullers' Match, for a silver wherry: won by C Fawcett, of the Mercer Club; Mr. J. Martin, of the same club, being second, and Mr Bailey, of Putney, third

Scullers' Match by six sons of watermen under fourteen years of age, for money prizes: won by F Kelly, of Fulham; H Knight of the same place being second, R. Anthony, of Hammersmith, third, and F Robinson, of Putney, fourth. Seven started, all claiming a right to row.

Watermen's Pair Oar Match: won by T. Goodrum and J. Cole; F Lett and J Kelly being 2nd, H. Piner and C. Campbell 3rd, and J. Rippen and another 4th.

Pair Oar Landsmen's Match: won by G. Green and J. George.

The Regatta of Friday was witnessed by a large party of fashionable

FANCY FAIR IN AID OF THE FUNDS OF THE "DREADNAUGHT" HOSPITAL.—(SEE NEXT PAGE)

TEMPLE BAR ILLUMINATED

and distinguished guests, at Mr. Lumley's *fête artistique* and *déjeûner*, at "the Chancellors." In the list of guests were some of the most popular names among authors, composers, vocalists, musicians, and operatic *artistes* of every class; with some of the more prominent members of our senatorial, diplomatic, and fashionable circles. The picturesque pleasure-grounds of Mr. Lumley's villa were superbly decorated for the occasion, and the illumination of the avenues and shrubberies with variegated lamps had a charming effect. The entertainment was conducted in the most elegant style, and was joyously appreciated by the numerous and brilliant assemblage.

Dur ng the day, there was exhibited on the lawn at "the Chancellors" the splendid boat built by Messrs. Noulton and Wylde, of Lambeth, to be presented by the body of watermen to his Royal Highness the Prince of Wales. This boat is in the old style of a London wherry, such as was formerly used by Thames watermen; but is, of course, much lighter and smaller. The materials used in her construction are, mahogany planking, maple timbers, and bird's-eye thwarts, highly polished and copper fastened. On the knees there are carved lions' heads; the Prince of Wales' crest is painted under each rowlock; and on each side the boat abaft the rail, the City arms are painted on the bridge under the sailing thwart; and the Watermen's arms on the fashion-board in the stern. The rail is mahogany, with the Prince of Wales' crest carved in the centre, and the rose, shamrock, and thistle on each side. The sides are padded with horsehair, and covered (as are also the cushions and sitting-mats) with crimson satin, trimmed with white lace. The head and state-room mats are of crimson ground, with the Prince of Wales' crest worked thereon in white. The keel band is copper; the head and stern clamps and bands are of brass; as is also the striping. Everything, in fact, is of the very best description, both as regards materials and workmanship.

The length of this beautiful boat is 27 feet; breadth, amidships, about 4 feet.

The boat was ordered to be taken to Windsor, yesterday.

FANCY FAIR ON BOARD SHIP.

On Thursday and Friday (last week) a Grand Fancy Fair was held on board the *Monarch* and *Alfred* (Mr. Green's East Indiamen), in the East India Docks, for the benefit of the *Dreadnought* Hospital Ship. The sale was held on the main deck of the *Alfred*, the articles consisting of rare and curious productions of various parts of the world, the ingenuity of India being superb y represented. The *Monarch* was appropriated to refreshments and promenading, the band of the Royal Horse Guards Blue playing throughout each day. The charge for admission on board the ships was 2s. 6d. each person upon the first day, and 1s. on the second day; and the returns for articles and tickets were £1140. The attendance was—first day, 1400 persons; second day, 1600. Mr. Green liberally granted the use of his two large ships; and the *fête* was admirably arranged by Mr. James Selfe, of Blackwall.

The hospital (in whose aid this Bazaar was held) is commonly known as the "Seamen's Hospital," on board the *Dreadnought*, three-decker, moored off Greenwich, and is a most important charity; it being well known that, sooner than enter a land-hospital, many a poor sailor will peri h afloat, although a prospect of returning health is held out to him by proper medical treatment. The "Seamen's Hospital," established 1821, nursery, dated 1833, is partly supported by voluntary contributions to an extent of £3000 per annum, and in part by the p nalties and forfeitures under the 9th and 8th Vict., cap. 119, amounting to £600; and by 5 per cent. of the amount collected from the merchant-service vessels, "for the relief of maimed and disabled seamen, their wives, and children;" amounting to nearly £300 per annum. The annual number of patients averaged 5000; and the usual number of in-patients is 250.

The *Dreadnought* is right at Trafalgar, and occupied the Spanish three-decker, the *San Juan*, which had previously been dragged by the *Bellerophon* and *Defiance*.

TITHE REDEMPTION TRUST.—A meeting of the board of this society was held on Wednesday at their offices, No. 1, Lancaster-place, Waterloo-bridge; Lord John Manners, M.P., in the chair. Numerous fresh cases requesting information and advice, from parties who are about to purchase tithes, were gone into, some of which seemed to require chiefly the energy of the h cumbents themselves and their friends to apply for aid to the trustees of clerical and other corporations in whom the power over the alienated tithes of their parishes is vested: others were cases in which pecuniary assistance from the trust might be obtained, did the funds at the society's disposal consist of ir n immediately undertaking any fresh cases. An earnest hope was expressed that the parties who are now taking an active part in the matter of "Church extension" would direct their attention to the vast amount of lay and clerical tithes alienated from the Church as the most available and most legitimate means of endowment for the new churches they are proposing to build.

HER MAJESTY'S VISIT TO THE CITY.

TEMPLE BAR ILLUMINATED.

On Wednesday evening this often abused modern-antique Bar-gate appeared to great advantage; each of its faces presenting a very brilliant display of lamps, which, though they paled their comparatively "in ffectual fires" before the more vivid light of gas formed a rich, varied, and gemmy picture.

Our Artists have represented the western front of Wren's gate, whose architecture was, perhaps, never more gorgeously set off than upon the present occasion; often as the good citizens have testified their patriotism and loyalty by lighting up this "handsome gates as any about town." The central device was a large imperial crown and cushion, which, by the way, are especially well adapted for lamp illustration, the gold, gems, and velvet being thus characteristically represented. Above the crown were branches of laurel flanking a star of Brunswick in the centre of the pediment, the outer lines of which were covered with lamps. This architectural illumination was continued in the pilasters, and upon the spandrils and pedestals of the niches, in white and green lamps. Wren's favourite scroll ornaments, beside the pilasters, likewise shone in lamps; above the footways, were the Royal "V. A.;" and the heads of the arches were resplendent with white and blue lamps.

The eastern side of the Bar was similarly decorated. Altogether, this was a most brilliant illumination; and those who rejoice in lamp statistics will be interested to learn that no less than 22,000 variegated lamps were employed in this illumination alone. Their brilliancy and colouring were much heightened by polished reflector

A List of the more striking illuminations will be found at page [illegible] of the Number published with the present. We have, however, an omission to explain.

The office of the ILLUSTRATED LONDON NEWS—a large gas star and the national colours. [We had commissioned Mr. Palmer, the gas-fitter to the Royal Italian Opera, Covent-garden, to execute for our office a large design of the Crystal Palace in gas: this was undertaken by Mr. Palmer some three weeks since; but, in the middle of Wednesday last, he declared his inability to complete the contract.]

THE QUEEN AT GUILDHALL.

THE first feeling, and very often the first exclamation, with the majority of the visitors who reached Guildhall after the first hour, was—"Where is the ball to take place; here is the hall, and here is the company; but, unless we waltz on each others heads, where is there room for dancing." And as such and such like questions were repeated, there still kept flowing in a never-ending stream of brilliant company, until in the centre of the hall, and towards the throne erected at its eastern extremity, the crush was something remarkable. The current of fresh arrivals, however, guided by the glittering wands of the City authorities, generally flowed through the more stationary throng, making for the entrance door on the north leading to the Court of Aldermen and various City offices. These last had been fitted up with considerable tact for the occasion. The rather dingy walls were festooned with gay draperies. Statuary in abundance, old and new, good and bad, in plaster and in marble, was lavished along the apartments and corridors; some of the most conspicuous figures and groups, arranged in recesses, surrounded by white calico, through which a soft light fell upon the marbles and the little sea of exotics and flowers from which they rose. Fancy a waste of offices and passages, with their cold nooks and corners and closets thus beautified, people it with a flowing stream of lounging and admiring company, the greater number of the gentlemen in uniform, and you have a picture tolerably different from that usually presented by these dim City offices. In the Court of Aldermen the walls were wreathed and festooned. A quadrille band occupied a box fitted up for the occasion, and a few indefatigable dancers managed to keep clear a small central space for waltzes and polkas.

Adjoining these public rooms were those appropriated to her Majesty and her suite. There was a draw ng-room, into which the Royal party were conducted generally, and a boudoir and dressing rooms off it for the Queen's special use. All these apartments were got up with very considerable taste; the walls of each hung with amber and silver, and pink and silver draperies; the furniture, consisting principally of articles of marqueterie and fancy cabinet-work, strewed with statues in Parian and marble, with vases containing bouquets, and small fountains of *eau de Cologne*. The toilet-table with its wreaths of white lace drapery, and the principal table in the retiring-room brightly inlaid with brass and pearl, were both withdrawn from the Exhibition, where they were being displayed by Mr. Herring, the City upholsterer; and where, of course, they will be again deposited.

Returning to the main hall, we find the crowd still augmenting, and proceed to take some note of the filling up of our ancient *Hôtel de Ville*. The judgment to be passed cannot, we fear, be favourable. The decorations were, for the most part, floral. A series of projecting ornaments ran like a range of swelling bastions high along the walls. From each bastion a national flag depended. On each, displayed amid a mass of gaudy floral ornaments, shone the corresponding heraldic device; while from the abominable white and blue flat roof, down to this range of ornamental excrescence, hung a perfect forest of tangled wreaths and garlands of artificial flowers. Beneath, again, in the panellings of the windows, and between the traceried mouldings of the Gothic arches, were cleverly-painted oil sketches, representing national landscape and costume, each corresponding, of course, to the banner which hung above it. These drawings, executed by Mr. Fenton, were the best things in the way of decoration in the room, the strange nondescript style of the getting up of which entirely destroyed the real proportions of the fine old hall, and as completely did away with its Gothic characteristics, the more especially as the magnificent arched windows at either end were more than half hidden in the one case by an illuminated glass star and a circular trophy of flags; in the other by the appendages of the throne, and a flaming tissue of cloth of silver, bearing the Royal cyphers, behind it. As a whole, then, the general feeling was that Guildhall had been most satisfactorily converted into a booth, and that the only school of art which had been called into action to assist in the transformation was that, specimens of which, every Easter and Whitsuntide, may be seen at Greenwich.

It was nearly ten o'clock, when the half-heard cheering without, followed by the sharp, clear ring of trumpets, announced the Royal party. The Lord Mayor, with all the City officials ranged in order due, of course, received the Sovereign, and then the Royal party slowly marched across the hall: the members of the suite, blazing in uniform and court costume, heading the procession; then the City magnates, duly begowned and be-chained, with mace and sword, the latter carried by Washington Irving's old friend, the "man with a fur porringer on his head," the Lord Mayor walking upon her Majesty's right hand, while she leaned upon Prince Albert's arm. In this style the procession defiled through the hall, through the maze of offices and corridors which we have described: and then, emerging again into the main room, the Queen was conducted to the throne prepared for her. The applause which attended her Majesty was not vociferously and uproariously loud; but a hearty murmer of greeting and approbation, swelling sometimes into a hoarse cheer, and again finding vent in loud and general clapping of hands, rose all along the course of the Royal party. The Queen upon the throne, the company, instead of dancing—any attempt at which would have been impossible—began to press in a slow continuous stream past the throne, making due obeisance to her Majesty as they defiled. This lasted for an hour or so, and then a little square place, not much bigger than a good-sized hearth-rug, was opened up in front of the throne, and some formal Court quadrille danced by the ladies and gentlemen of the suite, the mass of the company continually pressing towards the upper part of the hall, so as to render the positions of the functionaries, who may be said to have kept the ground, anything but sinecures.

About eleven o'clock, or shortly before that time, her Majesty and her party retired to the rooms provided for them, and a great portion of the company, without waiting until Royalty had set them the example, began to think about supper. Beneath the Court of Aldermen and its offices runs another series of business rooms, halls, and corridors, and these presented a vast constellation of supper tables, branching off in every direction, and stretching into unknown recesses in the very bowels of Guildhall. As the great room was thus, to some extent, cleared, one got a better notion of the company. The general remark was, the paucity of foreign faces. Hardly a beard or moustache to be seen. The Ball was understood to have been given in honour of the Exhibition of all Nations, but certainly the kingdom mainly represented was the honoured land of Cockaigne. Not even at a City election have we ever seen such a genuine City assemblage; only broken here and there by the well-known face of some Parliamentary or judicial notability. The gravity of the assemblage was also peculiar. The few of our foreign friends who were present, must have

some to the conclusion that the congregation of "spleen" was prodigious; and that if such were the faces which the English brought to a ball, dire indeed must be the countenances they carried to more serious matters. As a merry-making, certainly the City *fête* was not a success; but if there were but few smiles to be seen, and no laughs to be heard, there was, at all events, a stately brilliancy about the assemblage which was not without its peculiar effect and significance.

Her Majesty, as our readers are aware, alighted in the crypt. This room and its arrangements were indeed the most noticeable points of the affair. The crypt in question lies directly under the eastern half of the Guildhall. For many years—perhaps centuries—its existence was virtually unknown, save, perhaps, to some old retainer of the establishment, and the room was degraded into an airless, lightless lumber cellar, where old broken-down or broken-up office furniture, and all sorts of disregarded rubbish were left to moulder away in the darkness. Recently, however, the Corporation had their attention directed to the architectural beauties of the place. A clean sweep was then ordered, the lumber routed out, the walls scraped and cleaned, and last night, when her Majesty descended to her supper-table, she perceived that she was in a spacious if low cloistered vault, the groined roof springing from two rangs of pillars, and arching not many feet above her head. The place was solemn and striking, without being sombre. Imitations of tapestry, which, we regret to say, were nothing more or less than slanted sacking, hid to some extent the rough nakedness of the ancient walls. Suits of armour were arranged above. Old guns, and pikes, and bows flourished abundantly, set in trophies along the pillars; and the place was lighted by a number of figures in complete armour, brought from the Tower, each grasping a huge gas-pipe, got up so as to resemble a flambeau, in its mailed hand.

In the crypt two tables were spread—a long one for the general suite and the City authorities, a small round one for her Majesty and her more private party. The regular supper was provided by Gunter, but a refreshing meal was added to by the style of dishes which the Messrs. Lacy with very good taste provided. At one end of the long table figured a stately peacock, with his tail outspread in all its glory; at the other end reached a huge boar's head, decked with the accustomed legitimate rosemary, and bearing emblazoned on a scroll the good old hymn

Caput apri deferro
Reddens laudes Domino

And, altogether, it may perhaps be safely affirmed that never since the days of rush-strewn floors and tapestried walls, did a European Monarch sit down to a repast in a chamber so thoroughly smoking, not of institutions, but of the grim architectural realities of the stern old feudal times.

METROPOLITAN NEWS.

REGISTRARS OF DEEDS IN MIDDLESEX.—On Saturday a return to the House of Commons was printed, showing the fees and all other sources of emolument received by the registrars of deeds in Middlesex. The return is of some importance in connection with the Registration of Assurances Bill, now in the House of Commons. Last year each of the four registrars received £971 1s. 6d.; the deputy registrar and chief clerk, £564 12s 6d; the second clerk, £374 14s 3d.; the third clerk, £88 8s.; and the second clerk, £83 4s.; the six copying clerks received 30s a week. The Middlesex Register Office was established in the reign of Queen Anne. The duties are not generally performed by the registrars in person, but by their deputy. The new measure will affect the Registry Office in Middlesex.

INTRAMURAL INTERMENTS.—From inquiries lately instituted by Mr. George, churchwarden of St. Anne's, Westminster, on the subject, it appears that the number of interments in the vaults of the parish churches and burying-grounds for 160 years have been 120,0, of which there remain now only 460 coffins, and it is supposed that the remaining 1460 have been abstracted for the value of the lead or when the coffins were composed of wood. In the open burial-ground, three-quarters of an acre in extent, there have been 13,788 interments during the last 20 years, and 15,440 during the last 160 years. The Government calculation of interments to the acre is 116, but it appears that there have been during the last 20 years upwards of 1000 to the acre. When will the Board of Health carry out the new law against burying the dead amongst the living?

ASSOCIATE INSTITUTE FOR THE PROTECTION OF FEMALES.—A conference of the friends of this society was held at Herbert's Hotel, Pancras-yard, on Thursday last, when it was resolved to petition Parliament to pass an act giving the summary power for the punishment of the assault of ill-fame, and to use every exertion to obtain an act subjecting to condign punishment all parties procuring, either as *procureurs or* as the keepers of brothels, the defilement of women.

CITY OF TORONTO, AND LAKE HURON RAILWAY COMPANY.—The annual meeting of this company was held on Thursday last, at the offices, Great St. Helens-place. Charles Franks, Esq., in the chair. It appeared, from the report, that some proposals had been made by the provincial Government of British North America, for affording assistance in carrying out the important object of forming a trunk-line through British North America. If the formation of this line should be undertaken, of which there is every hope, then it would be a most important benefit to this company, extending as it would to the western limits of Canada, so as to accommodate the passenger and other traffic of the great country to the West, and bring into the market the rich localities adjoining the great lakes of the interior. Under these expectations, the directors recommended that they should not delay any present proceedings, and kept a sum sufficient to meet the provincial loan of £1,000,000 to assist them to do. The report was adopted, the retiring directors re-elected; and, after a vote of thanks to the chairman, the meeting separated.

CANTERBURY COLONISTS.—A meeting of the members of the Canterbury Association was held on Wednesday, at their rooms, Adelphi, Captain Dashwood in the chair. A despatch from Mr. Godley, the chief agent to the association in the colony, was read, which stated that the selections of land had been made by those colonists who possessed a priority of choice, and which had been done in a manner to give much satisfaction to the colony. With two or three exceptions, the selections had been made within four miles of the town of Lyttelton. Considerable reserves had been made for churches, schools, and for a cemetery, and a reserve of one chain had been made to the association on the coasts, harbours, and navigable rivers. A letter from William Parish, a labouring man in the colony, was then read, which stated that he worked for eight hours a day for 6d. an hour, and his wife at 3d. an hour and her victuals. Land could only be obtained from those who had previously purchased it in England; but 5s. an acre was required for renting good land, most was 6d. a pound, beer was 1s. 6d. a quart, tea and coffee were cheap, and the natives civil and quiet.

EAST INDIA COMPANY.—On Wednesday a ballot was taken at the East India House for the election of a director, in the room of Henry St. George Tucker, Esq., deceased. At six o'clock the glasses were closed and delivered to the scrutineers, who reported that the election had fallen on John Harvey Astell, Esq.

BROMPTON HOSPITAL FOR DISEASES OF THE CHEST.—The Lord Bishop of Bombay will preach a sermon on behalf of this institution in Quebec Chapel, Portman-square, to-morrow, the 13th inst. At the last meeting of the managing committee, Sir Henry Fowler, Bart., in the chair, it was stated that another grand reunion of the Household Bands should be held, and by the kind permission of the Right Hon. the Viscount Ranelagh, in the extensive and beautiful ground of Mulgrave-House, at Fulham, on the 17th inst. The fullest expectations are entertained on the benevolent object. The eastern wing of the hospital will be proceeded with as early as possible, affording then accommodation to more than two hundred in-patients.

ROYAL ORTHOPÆDIC HOSPITAL.—A bazaar and fancy fair will shortly be held in behalf of the building fund of the institution. Many distinguished ladies, and the lady patronesses generally, have taken up the cause with much spirit, and have at once evinced their feelings of benevolence and varied accomplishments by the contributions of fancy work, &c., with which it is their intention to enrich the bazaar. Her Majesty the Queen, in addition to a subscription of £100, has been pleased to accord her special patronage to the undertaking.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST.—The Corporation of London have munificently granted a further sum of 100 guineas towards the funds for the erection of the new hospital at Victoria Park, the foundation-stone of which was laid a few days since, by his Royal Highness Prince Albert.

WESTMINSTER IMPROVEMENT.—VICTORIA-STREET.—The new street, to be called "Victoria-street," communicating between Belgrave-square and Westminster Abbey, will be opened in a few days—the pavement on either side being nearly formed, and the entire length of road-way laid nearly with stone. In the course of the previous week, the commissioners came into possession of the premises of the united parishes of St. Margaret and St. John's, which was the only obstacle to the formation of the street, and which will be speedily removed. Several sites have been obtained on the line for public institutions—among them being the National School Association. There are still, however, many to be disposed of. The thoroughfare will be opened on the 1st of August, it being intended on the event that there shall be a special ceremony. When the buildings are comp eted, and which are to be houses of the first class, it is expected that the street will be the finest in the metropolis.

DISTRESSED NEEDLEWOMEN'S SOCIETY.—A meeting of the subscribers to this society was held on Monday evening, at the office, 75, Newman-street, Oxford-street, to receive statements as to the financial accounts, which it appears have lately undergone an inspection, with unsatisfactory results. The chair was taken by Mr. Ridgway. At the commencement of the proceedings, Miss Cass, a lady of fortune and a subscriber to the society, expressed a wish to be heard on some charges which she had to prefer against Mr. Roper, the honorary secretary; but the friends of that gentleman objected, protesting against the legality of the meeting. After much angry discussion Miss Cass succeeded in making her statements, and questions relating to the receipt and application of numerous and large sums of money were put to Mr. Roper. In the end a resolution was put and carried subpending him from his office until a general meeting of the subscribers should determine what further steps to take in the matter.

ALLEGED HOMICIDE BY THE POLICE.

On Monday, Mr. Payne held an inquest at the Red Lion public-house, Shoe-lane, City, on the body of John Hogan, aged 29, of No. 28, Plumptree-court, Holborn, who, it was alleged, had been so injured by a supernumerary officer of the City police, without giving the least provocation, that he died. The evidence of several persons was to the effect that on Saturday night the deceased had been wantonly and severely beaten upon the head by a police officer. The deceased expired almost immediate y after the ill-usage he had received. A policeman named Cole was sent for in the course of the proceedings, and as he approached the house where the inquest was being held, he was greeted with groans and yells. He denied that he had ever drawn his staff, or had treated deceased with any violence whatever. The coroner eventually adjourned the inquest, but expressed his opinion that some of the witnesses who had given evidence in favour of the policeman was having, the mob fo lowed, pelting and hooting at him, and when they got into Farringdon-market it was found necessary to take some of the rioters into custody.

The inquest was resumed on Tuesday, when Mr Topping, the sur eon, who gave evidence the preceding day, said that by order of the coroner he had made a post mortem examination of the body of deceased, and in so doing he found several contusions on the right shoulder and behind the right ear, while extended to the temporal muscle. On removing the scalp he found the muscles to each be much bruised. The taking of the skull off on the crown of the head was found to be very much congested. He also found a blood-vessel that supplies the brain ruptured, which corresp nded with the external bruises. The other portions of the brain were healthy. He had made no other examination of it to body, as he did not consider it necessary, as the injury to h id before spoken of was quite sufficient, and was the cause of death.

The Coroner—How do you account for these injuries?—Witness—From the result of external violence

The Coroner: Can you tell from the bruises or wounds what descrip ion of article caused it?—Witness: I should say, either from a bone or a fist, and certainly not which with some and sticks once, but was of the two as was unlikely to be.

The Coroner having summed up, the jury retired, professing for an hour and a half, and returned a verdict, "That the deceased died from the effects of violence at the hands of the police; but were unable, from the evidence they had sufficient evidence to prove"

The Coroner: Then you mean to say, "Manslaughter against some police unknown?"

The foreman answered in the affirmative, when

The Coroner said it was most extraordinary that in a place like the City of London they were unable to find out the person who had committed a flagrant felony, he impressed on that jury the necessity for the police authorities doing all they could to find out who the persons was who had caused deceased's death. The effect of the verdict was, that the coroner should be bound over.

The jury then handed in the following memorial to the coroner, with a request that it might be forwarded to the proper authority:—"We, the jury empanelled to enquire into the death of John Hogan, are of opinion that the neighbourhood in which that person resided should be in a more disturbed state in the house in which the deceased lies, the drainage, or some other cause, made an offensive smell on great had risen. We are convinced that the fever was quickly spreading from the same source, and should an epidemic arise visiting the City from the present state of these courts, the City had better would be a nursery for pestilence and disease. They also suggest the propriety of an addition of lamps in those courts in the vicinity of the Holborn end."

WESLEYAN REFORM MEETING.—A public meeting for Wesleyan reform took place on Tuesday evening, in Bishopsgate Without, near Exeter Hall, which was completely filled. Mr. William Cosens Hardy, of Leatherhead Hall, Norfolk, was voted to the chair. The meeting having been opened with prayer, Mr. Hardy detailed the objects of the meeting. He said he never before saw such a demon tration for rel gious liberty as this meeting presented. Mr. Harrison, one of the secretaries, read the report. It sta ed that the present agitation was gradually, from the same principles, and spreading over the countries of the greater portion of the Wes eyan people. This movement contemplated as its object nothing but what pr mitive Methodism warranted, what the Scriptures fully sanctioned, and what the Church of England herself also advocated. The meeting was then addressed by Mr. Langridge, of Sunderland, one of the expelled local preachers, and other speakers, and resolutions agreed to enthusiastically, the meeting separated.

THE NATIONAL DEBT.—In Tuesday's *Gazette* it is announced that the Lords Commissioners of her Majesty's Treasury are paying certified to the Commissioners for the Reduction of the National Debt, in pursuance of the act 10th George 4, c. 27, sec. 1, that the actual surplus revenue of the United kingdom of Great Britain and Ireland, beyond the actual expenditure thereout for the year ended the 5th day of April, 1851, amounted to the sum of £25,126,181 2s. 4d., the Commissions ones for the Reduction of the National Debt give notice, that the sum of £731,045 5s 7d. (being one-fourth part of the said surplus of £2,924,181 2s. 4d.) will be applied under the provisions of the said act, between the 7th inst. and the 10th of October next, to the following purposes; viz

To be applied to the purchase of stock	£731,045	5 7
And interest receivable on account of Donations and Bequests, to be applied to the purchase of ditto	3	11 5
	£731,049	16 0

A. Y. SEARMAN, Comptroller-General.

National Debt Office, July 3, 1851.

BIRTHS AND DEATHS.—Births registered in the week ending Saturday, July 5:—Males, 746; females, 784: total, 1530. Deaths during the same period:—Males, 534; females, 469: total, 1003. The number of births in the corresp ding week of last year. In the corresponding weeks of the ten years 1841-50 the average number was 873, the lowest of the series having been 745 in 1842, and the highest 1019 in the year 1847, when the population and mortality was making some progress. But, if the average be raised in proportion to increase of population, 960 is the estimated amount, compared with which the last week's number is 430 below the average. The mortality from principal epidemic diseases presents nothing remarkable in this return as regards the aggregate amount of deaths, which differs little from the result of the previous week, or from the average mortality of the corresponding weeks of the last ten years. In the present table 214 deaths are enumerated as caused by epidemics, and these are distributed as follows:—16 were from small-pox, 29 from measles, 23 from scarlatina, 38 from hooping-cough, 5 from croup, 3 from thrush, 23 from diarrhœa, 4 from dysentery, 5 from cholera, 1 from influenza, 2 from purpura, 4 from rem tient fever, 45 from typhus, 1 from puerperal fever, 1 from diffusible fever, 11 from erysipelas, 1 from syphilis, and 2 from noma or cancrum oris. As compared with the results under the same heads in the week preceding, measles and hooping-cough, but especially the former, have increased, with scarlatina, typhus, and the diarrhœa or English cholera, which begins to prevail as the season advances, show an increase. The number of deaths ascribed in this return to diseases of the respiratory organs is 114, while the average of corresponding week is 84, or, with a correction for increase of population, 92. This statement is exclusive of phthisis, which last week terminated the lives of 142 persons. The deaths of two persons were ascribed to intemperance.

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean reading of the barometer was above 30 in. on Sunday. The mean of the week was 29.874 in. The mean temperature of the week was 62·9 deg., which is rather above the average. The highest on the 4th was 77 degrees, and the lowest on the 1st was 49·1 degrees, or 8 deg. above the average of the same day in ten years. The mean temperature was below the average on the last three days. The wind was generally in the north-east.

THE INCUMBENTS OF THE BISHOPS OF THE ESTABLISHED CHURCH.—This subject has been lately discussed in the daily papers, and this week a contemporary, "in order that the case may be thoroughly understood," gives the following scheme of the English bishoprics, as settled in 1837, with the respective incomes then assigned to them, and adds the annexed list of revenues actually received by them in 1850, as given under the signatures of the Bishops themselves in the return just laid before Parliament:—

	Assigned in 1837. £	Received in 1850. £
Canterbury	15,000	15,000
York	10,000	10,000
London	10,000	10,485
Durham	8,000	7,000
	(Paid to Commissioners, £11,000)	
Winchester	7,000	6,954
St Asaph and Bangor	5,000	5,251
	(Paid to Commissioners, £1,300)	
Bath and Wells	5,000	6,163
Carlisle	5,000	6,951
Chester	4,000	2,275
Chichester	4,000	4,249
	(Paid to Commissioners, £650)	
St David's	4,000	3,000
Ely	4,000	9,223
		4,253
Exeter	5,000	1,000
Gloucester and Bristol	5,000	1,000
Hereford	4,000	4,729
Lichfield	5,000	5,251
Lincoln	8,000	6,261
Llandaff	4,000	2,295
Manchester		4,200
Norwich	4,000	7,231
Oxford	5,000	7,231
Peterborough	4,000	6,442
Ripon	4,000	4,456
Rochester	5,000	4,456
Salisbury	5,000	6,957
Worcester	4,000	4,729
		12,813
	(Paid to Commissioners, £13,000)	5,149

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

Another quiet week in the English funds. The extreme range of prices in Consols for the opening, has been limited to ¼ per cent. On Monday, Consols opened at 97 to 97⅛; but some private transfers ranged a shade as low as 96⅞ to 97, which was the closing price. Opening at the same quotations on Tuesday, an increased depression reduced prices to 96⅞; the closing figures were, however, the same as on the previous day. Although the payment of the dividends commenced on Wednesday, no improvement occurred in the price of Consols; and on Thursday the market was quiet during the day at 96⅞ 97 for the opening. Exchequer Bills have advanced, as well as India Bonds. Bank Stock has also an upward tendency. The Money Market has been described a fortnight back within the last few days, and the value has consequently declined a fraction. At the close of the week's business the prices of the stocks were:—Red., cod., 97⅛; Consols, 96⅞; New Three-and-a-Half per Cents, Annuities, 98; Long Annuities, to expire January, 1860, 17⅛; India Bonds, £3 000, 53 p.; Consols for Account, 96⅞; Exchequer Bills, £1000. 53 p.; £500, 53 p.; Small, 53 p.

Mexican and Sardinian Stocks have been the two active securities of the week. The correspondence between the Bondholders' Committee here, and the American authorities, has placed the payment of the proportion of the indemnity money in a new light. Hap ears the American Government have no power to accept of cash on the treasury, much less to appropriate it. Certain new Treasury Bonds are payable in Mexico only, and in the current coin of Mexico. As this postpones the fulfilment of the conditions upon which the shareholders have agreed to accept a three per cent stock, the effect upon the market was a decline of 2 per cent. Sardinian stock was quoted for the first time on Monday: it commenced at ½ premium, and closed at ½ to ⅝ discount. On Wednesday it opened at ⅜ discount, descended to 3 discount; but this rapid decline brought buyers into the market, and the price rallied to 1⅞ ⅝ discount on Thursday, again declining to 1⅞ discount. Mexican rallied to 22¾ on Tuesday. Peruvian maintains its high price, and Russian Stock is firmer. Dutch Two-and-a-Half per Cents are pretty well upheld without the dividends. The coming quotients are—Mexican Five per Cent, Account, 32⅞; Ditto, Small, 32⅞; Peruvian Bonds, Account, 90⅞; Portuguese, Small, 34; Ditto, Four per Cents, 34; Russian Bonds, 114; Sardinian Bonds, Scrip 1⅞ ⅝; Spanish, five per Cent, Account, 20⅞; Ditto, Three per Cent, Account, 38⅞; Dutch Two-and-a-Half per Cents, 63⅞; Ditto, Four per Cent, 91⅛.

The railway market continues heavy, and the quotations are perfect y unaffected by the large increase of traffic. The closing prices are:

Undivided Shares and Stocks.—Aberdeen, 10⅞; Bristol and Exeter, 79; Caledonian, 9⅞; East Lancashire, 4⅞; Edinburgh and Glasgow, 29½. Great Northern, 17⅛; Ditto, Halves, 8⅞; Ditto, Thirds, 5⅞; Great Western, 83¾; Ditto, A's, Ditto, Four per Cents, 84; Irish Bonds, 114; Scottish Central, 14; London and Blackwall, 7; London and North-Western, 102½; Ditto, Quarters, 25⅞; London and South-Western, 34; Mid and, 42⅜; Ditto, £50, 15½; Norfolk, 14⅞; North Staffordshire, 8½; Oxford, Worcester, and Wolverhampton, 14½; South Eastern, 22½; York, Newcastle, and Berwick, 18½; York and North Midland, 18½

Lines Leased at Fixed Rentals.—Eastern Counties, 8½; Hull and Selby, 118; Preference Shares.—Great Northern, 5 per Cent., 138; Manchester, Sheffield, and Lincolnshire, New A10 , 7½; York and North Midland, 11 sells Paris new 50.

Foreign.—Boulogne and Amiens, 10½; Central of France, 2½; Dutch Rhenish, 6½; Ditto, Arnheim and Utrecht, 3½; Ditto, Guilder, 1, and Rogue 3½; Ditto, Utrecht and Amersfoort, 2½; Ditto, Zealand, 3½; Ditto, Zuyder Zee, 3½; Ditto, Zwolle and Leeuwarden, 1½; Eastern of France, 3½; Great Luxembourg, 4½; Namur and Liege, 1½; Northern of France, 10½; Orleans and Bordeaux, 10½; Paris and Rouen, 18½; Ditto, Havre, 18½; Ditto, Orleans, 18½; Rouen and Havre, 10½; Sambre and Meuse, 5½; Strasburg and Basle, 3½; Ditto, Shares, 3½; Versailles, Left Bank, 3½; Ditto, Right Bank, 3½; Ditto, Rouen, 3½.

THE MARKETS.

CORN EXCHANGE.—Very moderate supplies of English wheat have arrived in the port of London this week, whilst the receipts of other parts of the kingdom have been small. However, to the various accounts receiving the wheat and barley imported of foreign grain and flour, the demand for wheat was extremely heavy, at the full prices of last week. In the case of barley, the trade was dull, at a decline of 1s per quarter. Beans and peas were taken off to a limited extent, at the currency of last week. Oats were in good demand, at late rates. The following are the quotations:—

English.—Wheat, Essex and Kent, red, 34s to 38s; ditto, white, 37s to 40s; Norfolk and Suffolk, red, 32s to 34s; ditto, white, 37s to 40s; rye, 24s to 27s; grinding barley, 21s to 23s; malting ditto, 25s to 28s; malting ditto, 34s to 35s; Scotch and Lincoln malt, 40s to 44s; Ingham ditto, 44s to 46s; Kingston and Ware, 50s to 56s; Chevalier, 56s to 58s; Tartarian and common ditto, 34s to 36s; potato oats, 21s to 23s; Lincoln and York, 19s to 21s; Scotch and Irish, 19s to 21s; beans, 30s to 31s; ditto, old, 32s to 34s; pigeon peas, 28s to 30s; white, 27s to 29s; tollers, 26s to 28s per quarter. Town and country, 33s to 35s Suffolk and Norfolk, 32s to 34s per sack. *Foreign.*—Wheat, 32s to 36s per quarter; barley, 22s to 24s; malt, 42s to 46s; oats, 18s to 20s; beans, 28 to 30; peas, 28 to 30; flour, American, 21s to 23s per barrel; Canadian, 20s to 22s per barrel; Spanish, 20s to 22s per barrel.

Seeds.—A few parcels of new linseed have been on offer, at 38s per last. The trade, generally, is heavy at late quotations.

Oilcake.—English, unwing, 6l; ditto, Baltic, crushing, 6l to 6l 5s; Mediterranean and Odessa, 4l to 4l 10s. Hempseed, 32s to 34s per quarter. Coriander, 16s to 18s per cwt. Brown mustard seed, 10s to 12s per bushel. White ditto, 9s 6d to 7s 6d. Tares, 10s to 12s per bushel. English rapeseed, new, 44l to 47 last of ten quarters. Linseed cakes, English, 8l 5s to 8l 10s; ditto, foreign, 4l 10s to 4l 15s per ton. Rapeseed cakes, 4l 10s to 4l 15s per ton. Canary, 44s to 48s per quarter. Hemp, 34s to 36s per quarter. Flax, English, 30l to 34l per ton. Carraway seed, 24s per cwt. Coriander, 16s to 18s per cwt. Turnip seed, 9s to 12s per bushel.

Flour.—The prices of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 5½d to 5¾d per 4 lb loaf.

Imperial Weekly Average.—Wheat, 43s 3d; barley, 24s 7d; oats, 22s 1d; rye, 27s 6d; beans, 31s 3d; peas, 31s 6d.

The Six Weeks Average.—Wheat, 43s 10d; barley, 24s 7d; oats, 21s 1d; rye, 26s 8d; beans, 30s 11d; peas, 31s.

Duties.—Wheat, the quarter, 1s; barley, 1s; oats, 1s; rye, 1s; beans, 1s; peas, 1s.

Tea.—On the whole, there is more business doing in most kinds, especially Congou, at fully last week's prices. Common sound Congou is quoted at 10½d per lb. The duty is 2s 1d.

Sugar.—Owing, in a great measure, to the large quantities brought to public sale, the market has ruled exceedingly inactive, at a decline in prices of from 6d to 1s per cwt. Fine-grained Mauritius has been taken at 44s; fine Bengal, 42s; fine Manilla, 41s; fine grocery, 40s; and fine yellow, 39s per cwt for brown lumps

Coffee.—Fine Native Kinds have been in improved request, at fully last week's prices Mocha has risen 2s to 4s per cwt, and about 500 bags good ord. native Ceylon have changed hands at 30s to 30s 6d per cwt.

Rice.—The markets has become less active, yet prices have been well supported. Good white Bengal is worth 10s per cwt.

Provisions.—The butter is in very moderate request, at a further decline in prices of from 4s to 5s per cwt. Waterford, 64s to 70s; Cork, 70s to 74s; Limerick, 68s to 72s; Kerry, 68s to 72s; Carlow, 68s to 72s per cwt. Bacon is 2s to 3s lower. Fine Irish, 54s to 56s; middling ditto, 50s to 52s per cwt; fresh, 7s 6d to 10s 6d per dozen lbs. The beasts market is tolerably steady, at late rates. The sheep trade is dull, and prices have given way 2s per cwt. In lambs, and most other articles, very little is doing.

Tallow.—The demand for P. Y. C. is more active in consequence of the reduction in the duty. On the spot is selling at 37s 6d to 37s 9d per cwt. Town tallow, 35s 6d per cwt, net cash; rough fat, 2s per 8 lbs.

Coals.—Trade is in good request, at from 23s to 23s 6d per cwt. Southern and most other qualities are very dull, and the turn lower. The supply of the city are not to say any

Coals.—Hetton, 23s; Eden Vale, 23s; Carr's Hartley, 23s; Hartley, 23s; Tanfield Moor, 22s 6d; Hilton, 22s; Haswell, 21s 3d; Stewart's 1s 3d; Sidney's Hartley, 23s 6d per ton

Hay and Straw.—Meadow hay, 53s to 84s; new ditto, 43 to 54s; old straw, 41 to 45s; new ditto, 21 to 24s per load. Large quantities of new meadow hay sold at from 43s to 53 12s per load.

Spirits.—East India rum moves off slowly, at from 1s 3d to 1s 6d per gallon proof Leeward Islands is in a fair request. Fine Jamaica is worth 4s 6d. In brandy we have no change to notice Genevas dull, at 2s 7d to 2s

Hops.—Although the plantation accounts are not very favourable, the demand is inactive at the late rates. Sussex, £4 to £6 6s.

Wool.—The next series of colonial wool sales, at which 60 000 bales will be offered is appointed to commence on the 17th inst. Privately, the demand is very dull, at nearly former quotations.

COMMISSION SIGNED BY THE LORD-LIEUTENANT.

Queen's Own Regiment of Oxfordshire Yeomanry Cavalry: Geo Cleobulus Dashwood to be Lieut, vice H W Dashwood.

BANKRUPTCIES ANNULLED.

R TREDINNICK, Threadneedle-street, mining-agent. W GEE, Murray-street, Hoxton, straw-hat-manufacturer.

BANKRUPTS.

J. HALL, Brighton, hotel-keeper and victualler. J. FRIEND, Coventry, cotton-dresser. R. CROOM, Derwent, Glen-eastreuire, banker W KENDALL and J. STANLIEH, leads grocers J. BOWDLE, Liverpool, bookseller J. A.; MANN, Wrexham, ale-brewer J. MUNNAN, Oldham, cotton-spinner. J. CHEW, Manchester, stuff-manufacturer.

BIRTHS.

On the 3d inst., the lady of Dr. Conquest, of a daughter.—On the 4th inst, Lady Nicolson, of a daughter.

MARRIAGES.

On the 28.h ult, Baron de Hegel, Austrian Envoy Extraordinary and Minister Plenipotentiary at the Court of Turenny, to Elizabeth, only child of Major-General Farquharson of the Bengal Army.—On the 1st inst, the Rev George Samuel Robertson, M.A., rector of Sprowell, Northumberland, son of Archibald Robertson, M.D., to Helen Mary, eldest daughter of William Charles Kerr, M.D.—On the 3th inst, Lieutenant W Barnes, of Suffolk, R.N., of Shirley, Southampton to Harriet, youngest daughter of Robert Wilkes, Esq., of Canal Bridge, Southampton, and Lotts Hall, Essex.

DEATH.

On the 6th instant, the Rev Henry Stevenes, in the 59th year of his age, Vicar of Wymeswold and Walton, and nine years Fellow of Wadham College.—On the 27th ult., greatly regretted by his family and friends, Mr. Thomas Wood, the third son of the late Mr. Joseph Wood, Middle-row.—On the 3th inst, Richard Hall, Esq., of Bay House, Seaford, aged 61 years, of the Right Hon. Thomas Thesiger, and second son of the late Lieutenant-Colonel Charles Bevan, of the King's Own Regiment of Foot.

THE WINNER OF THE NEWMARKET JULY STAKES.—LORD JOHN SCOTT'S B. C. "BROTHER TO ELTHIRON."

NEWMARKET JULY MEETING.

We have engraved the Winner of the July Stakes at this meeting, run for on Tuesday (last week).

The JULY STAKES of 50 sovs each, for two-year-old colts, 8st 7lb; fillies, st 5lb; the second to save his stake. New T Y C.; 26 subs.

Lord J. Scott's b c Brother to Elthiron, by Pantaloon	(Whitehouse)	1
Lord Eglinton's b c Claverhouse, by Birdcatcher ..	(Marlow)	2
Col. Peel's b c Livermere, by Slane	(Flatman)	3
Col Anson's br c Bull's-eye, by Don John ..	(F. Butler)	4
Sir J. Hawley's b c Songster, by Touchstone ..	(J. Marson)	5

Betting. 9 to 4 agst Brother to Elthiron, and 5 to 1 each agst Claverhouse and Livermere. Songster was the first to show in front, but, after running about a distance, was passed by Brother to Elthiron and Claverhouse, the former going on with a strong lead, and winning in a common canter by two very long lengths, Claverhouse beating Livermere by three or four. Value of the stakes 675 sovs. Run in 1 min. 18 sec.

BEESTON CASTLE.

On Monday and Tuesday, the 23rd and 24th ult., the annual festival in aid of the widows and orphans of the Peckforton district of the Independent order of Odd Fellows M.U., was held on those picturesque and romantic heights; and the weather being highly favourable to the charitable objects of the assembly, a very numerous and highly respectable company assembled to enjoy the festivities of the occasion.

Several marquees had been erected amid the ruins of the Castle, and every accommodation had been provid d for supplying refreshments and for the amusement and entertainment of the visitors. Hornbin's band was stationed on the sawn, and poured forth the most enchanting strains; and the elegant quadrille, the fascinating polka, and the waltz were for hours enjoyed with uninterrupted delight by the greater portion of the company. About 2000 visitors were present on the first day, and amongst the company were John Tollemache, Esq., M.P., one of the esteemed representatives for the southern division of the county of Chester, and the proprietor of the enchanting domain, and his amiable lady, both of whom appeared to participate in the happiness which they had been the means of conferring upon the multitudes around them; as well as Wilbraham Tollemache, Esq., Miss Tomkinson, of Dorfold Hall, and various members of the most influential families in the neighbourhood. The proceeds amounted to £200; and for this salutary addition to the funds of the charity, the Order is mainly indebted to the excellent arrangements of Mr. Bird (the president of the meeting), and Messrs. Davenport and John and Thomas Cawley, the managing committee. To Mr. Mac Dermott, the Special High Constable of the Hundred, much praise was due for the good order preserved. Never on any former occasion was there such a display of female loveliness; and the *Chester Courant* adds: "Eloquent as our friends are on the opposite side of the Mersey in praise of the beauty of their Lancashire witches, we think they will, on this occasion, make the admission that they were beaten hollow by our Cheshire lasses."

ANCIENT BOAT FOUND IN WHITTLESEA MERE.

ANCIENT BOAT FOUND IN WHITTLESEA MERE.

In our Number for April 26th we gave an account, illustrated with four Engravings, of the drainage of Whittlesea Mere, undertaken at the expense of William Wells, Esq., the Lord of the Manor. The work is rapidly progressing, and the bed of the Mere is now a dry surface of hardened mud, cracked by the sun's heat into multitudinous fissures. As the works have advanced, many curiosities have been discovered; and, a fortnight since, a canoe, or boat, cut in one piece out of the trunk of an oak, was found in the centre of the Mere, imbedded in silt. The boat is of rude construction, the thwarts being fastened with wooden pegs; and its appearance altogether justifies the belief that it must have remained there for many centuries. The oak has become black from age and situation, but is still firm. The boat is 27 feet long, and 4½ feet wide.

VISIT FROM THE POTTERIES TO THE GREAT EXHIBITION.—On Saturday week, 200 of the workmen of Messrs. Davenport and Co., the extensive potters of Staffordshire, arrived in the metropolis by special train, for a week's visit to the Great Exhibition, their employers having liberally fitted up for their reception premises in Wharf-road, City-road; and omnibuses were provided to convey them each morning to the Exhibition. In expression of their gratitude, the workpeople have presented Mr. Davenport with a costly silver cigar-case and wine-flask, each bearing the following inscription: "Presented to W. Davenport, Esq., by the workmen in his employ, as a mark of respect, and to testify their appreciation of his kindness in enabling them to visit the Great Exhibition, 1851." The flask and cigar case are from the establishment of Mr. Angell, 10, Strand, and are elegant specimens of silver-work.

THE NEW SUGAR DUTIES.—The new and reduced rates of duty on all descriptions of colonial and foreign sugars, which came into operation on the 7th instant, are expected to cause the deliveries of sugar from bond to be large; and it is anticipated that the quantities of foreign, refined, and other sugars, required to be delivered on payment of the reduced duties for home use, will be so great, that arrangements have been made for such deliveries to take place to a later hour than usual, in order to meet the requirements of the trade. The retail price of first-rate refined or lump sugar is now less than half the price it was before the revision of the sugar duties took place, and the public will doubtless benefit to still further extent on this fresh reduction of the duties on all classes of foreign sugars.

THE QUEEN'S VISIT TO THE CITY OF LONDON.—THE ROYAL THRONE IN THE GUILDHALL

HER MAJESTY'S VISIT TO THE CITY.

GRAND STATE BALL AT THE GUILDHALL.

On Wednesday evening her Majesty honoured the Lord Mayor and citizens of London with her presence at a Grand State Ball at the Guildhall. This festivity was the more gratifying to her subjects and the numerous foreigners at present assembled in the metropolis, from the fact that it was projected and accepted by the Queen as a fitting pageant in commemoration of the great Congress of Industry now holding in the Crystal Palace in Hyde Park. Splendid and gratifying as former Royal progresses to the metropolis of the commercial world have been, there are circumstances in relation to that just over which invest it with a peculiar charm. It was no set form of etiquette, as upon the accession of a new Sovereign, which was now to be obeyed;—it was no transitory ebullition of feeling engendered by military successes of doubtful value, which was to be gratified;—it was a parade of hospitality and compliment to crowned heads, accidentally brought to our shores, which was to be made: it was more, much more than all this: it was the crowning tribute of honour from the highest personage in the land to the great world of Industry—the solemn recognition of the rights of peace and humanity and intelligence, that new social principle of the nineteenth century, which, whilst it will render impossible the repetition of many false and vain triumphs which have gone before, will infallibly supply in their place advantages to society which will endure, and with increasing fruits, to succeeding generations.

It was originally the intention to have invited the Queen upon this auspicious occasion to a banquet, or feast, upon the usual scale of civic magnificence; but it having been intimated that a ball would be more agreeable to her Majesty, her wishes were at once obeyed, and a splendid entertainment of a character altogether novel to the city of London has been the result. It must be obvious that the substitution of a ball for a dinner in the present case has been judicious upon more grounds than one. The entertainment in itself is one susceptible of a much more brilliant and exhilarating effect; whilst, more important still, it was one to which a much larger number of guests might be invited to participate. And when it is recollected how many foreigners of distinction are at present in this country, whether officially as Commissioners, or as Exhibitors, or as curious and interested visitors, to whom a ball is the most agreeable description of entertainment that could be provided, there does not seem to be room to hesitate for a moment between the comparative attractions of turtle-eating and quadrilling.

The Queen, having graciously accepted the invitation of the Lord Mayor and Corporation to the Guildhall, it was originally proposed to fix the ball for the 2nd instant; but, in consequence of that being the anniversary of the lamented death of England's great statesman and benefactor, Sir Robert Peel, the date was altered to the 9th, being Wednesday last.

The Corporation, resolved that nothing should be wanting on their part to give becoming *eclat* to this Royal pageant, which was to do them so much honour in the face of the whole civilised world, immediately upon her Majesty signifying her acceptance of their invitation, set about re-organising their ancient hall, so as to fit it for the unaccustomed festivity which was about to take place within it. It became necessary to this end to apply within the walls of the building a description of ornamentation of a lighter and more showy character than had been required in the case of what have been so familiarly known as "City feasts;" it was sought to minister to the eye and to the imagination, in a manner consonant with the lively sentiments inspired by the dance: and more than this, with a delicate feeling of hospitality which does them the highest credit, the committee entrusted with the arrangements were desirous, in the selection of the devices for the decoration of the hall, to pay an especial compliment to the foreign nations who had borne their part in furnishing the World's Fair, and whose representatives were to be invited on the occasion. And most successfully have they acquitted them selves of their task, as was testified by the warm and general encomiums which were elicited from the distinguished and elegant throng which graced their Ball, so elegantly and sumptuously prepared.

A principal approach to the hall is by a spacious porch on the south side; beyond which a temporary ante-room was erected, over which was a splendid illumination of the Royal arms. The entrance provided for her Majesty, however, was to the right of this, being the entrance to the law courts, over which a magnificent porch was placed.

On the right of the lobby, just at the entrance, a retiring-room for her Majesty was fitted up with much elegance; the walls and ceiling, which were draped after the fashion of a tent, being fitted up with the Dacian fabric (of which we shall have occasion to speak hereafter) of bright silver stars, spotted thickly on a blue ground.

DECORATION OF THE HALL.

The Great Hall had undergone a complete transformation, insomuch that it would hardly have been recognised by the oldest frequenter of civic festivities. The floor was boarded throughout, and covered with a rich crimson carpet; and around the walls, to the height of about twelve feet, a temporary Gothic screen was erected, partly for the purpose of improved ventilation, and partly for the purposes of the intended scheme of decoration. The ventilation was effected by means of a current of air produced by opening up the old arches over the crypt, the air being further cooled in its progress by passing over zinc cases containing ice. The ceiling was painted in panels blue and white; and in order to reduce the incongruous effect remarkable in this building, from the flat ceiling resting upon the Gothic arches of the walls, semi-circular balconies were erected at the base of each of the windows, bearing escutcheons of the City arms. Pendent from these, and above them, along the whole line of the walls, were rich festoons of flowers, of all colours, reaching to the ceiling, so that the contour of the building at the upper part was completely cured of its original angular outline, and a most fairy-like picture presented in its place. The massive Gothic pillars between the windows were covered with plates of silver and gold, so as to resemble, in form, the stems of palm trees; whilst above them were huge branches of leaves of a similar character, clusters of various fruits, and other devices of a like kind. The compartments of the walls beneath the above decorations were filled with allegorical devices emblematic of the various nations which have contributed to the Great Exhibition, together with copies of some of the principal works contributed by each respectively. England and her works had no part in this display, the intention being simply to pay a compliment to our various foreign associates in the World's Fair. It would be impossible to enumerate all the subjects represented in this portion of the decorations; suffice it to mention a few of them. In the division dedicated to America were depicted two pieces of sculpture—Power's Greek Slave, and a Fisher Boy, portraits of General Washington and Lafayette; an allegorical figure with the shield of arms of the United States, and an American Indian: Italy presented several of her best pieces of sculpture in the Great Exhibition, including the two pretty juvenile subjects with dogs, the Psyche, and an American Indian. China was represented by a junk, a pagoda, a mandarin, a lady, and two warriors, Tartar and Chinese. Prussia—the bronze statues of Frederick the Great and the present King, and the Amazon group. Belgium—Godfrey de Bouillon, the Lion in Love, and several tasteful specimens. Russia—the glorious gates of malachite, the malachite vase, a sleighing machine, and the Siberian fur-hunter. France—her hero of the Revolution and her Imperial guard. Austria—her "Maesppa," the "fountain," and the well-known "warriors" of Lambach. The Zollverein—its singular "Reynard the Fox," and its "Faust." By the side of the pilaster framing each compartment rested a light golden hand, upon which was a garland of roses, white and pink, from which depended, twining half-way down the wand, a light branch of bright green myrtle, as if some lovely nymph of old had been suddenly called away, and left her festive garland and her wand behind her. The name of each nation, with its armorial shield, stood in front of its particular department, and above floated its national flag. The following is the order in which they stood in this arrangement:—On the north side of the hall—Belgium, Russia, Egypt and Tunis, Persia and Arabia, Switzerland, Italy, Denmark, and Northern Germany. On the south side—Spain and Portugal, Norway and Sweden, France, Austria, the Zollverein, Prussia, America, and China.

The marble monuments to Nelson, the two Pitts, and Alderman Beckford had been newly cleaned, and stood out with extremely good effect, from the midst of the novel decorations introduced in a line with them.

The lower part of the walls was covered with rich crimson velvet; that on the upper part of the hall, the east end, where the dais of Royalty was erected, being emblazoned with the arms of the various aldermen of the City. Nor must we omit to mention those venerable genii of the City, Gog and Magog, who stood in their accustomed lofty positions at the west end of the hall, having received a new coat—of paint—in honour of the occasion. Their maces and clubs were laid aside for the nonce, and each held in his hand a bunch of holly, the type of merry king, hearty hilarity, and a ready welcome.

Here's to the holly
That hails melancholy

Looking towards the eastern window, our attention was caught by two gigantic griffins, the monster supporters of the City arms, sculptured in wood and silvered, standing out prominently from each side of the hall, and leading the eye up to the throne, which, elevated on a low dais of scarlet velvet, is placed under a Gothic canopy of white and gold, around and above which stood forth, from elaborately worked niches small figures of Kings and knights of the French and English Courts. A canopy of crimson velvet (the back of which was emblazoned with the Royal arms) surmounted the throne of crimson and gold. To the left of the throne were emblazoned the arms of Prince Albert; to the right, those of the Prince of Wales; underneath which stood chairs of state. Ranging on each side were the stalls or seats of the different aldermen, to the number of twenty-seven, the arms of each alderman, respectively, being emblazoned above his stall. Above these were trophied banners, with the flags of Great Britain and Ireland. On the left the Union Jack, with the flags of Ireland and of Wales. On the right, St. George's flag, with the Royal standard, and the flag of Scotland. Arching high above the throne, in letters of gold, rose the legend, "God save the Queen and Prince Albert;" and in the centre, backed by a brilliant golden tissue, which sent back every ray of light richly mellowed from its surface, shone a plume of Prince of Wales' feathers, seemingly of soft plumage, gracefully feathering over and swaying with a soft bend, yet made out of spun glass, and soaring to no less a height than nine feet: The charming effect of this very brilliant ornament defies description. On each side of the left arch, formed by the golden legend above mentioned, and by the great eastern window, two huge cornucopiæ, pouring forth fruits and flowers of temptating richness, gave a finish to the grand effect of the whole.

The hall, thus tastefully decorated, was lighted up with great brilliance. Suspended from the roof were two large chandeliers, with cut and coloured plates of glass, having upon them alternately the Royal arms and the initials V. R. The pillars were severally lighted with gas-lamps, with ground glass shades; and in the centre of the western wall was a magnificent crystal star, manufactured by Alderman Copeland, which, lighted up with gas, produced a dazzling effect. Below, to the height of five feet, the wall was covered with plate glass, thus mirroring the brilliant scene from end to end; and along this at intervals, so as to form a partial framework, ran branches of light green leaves.

The whole of the hall, and the rooms and offices attached to it, were brought into use to give increased accommodation to the numerous guests. The aldermen's rooms were fitted up in a sumptuous style as refreshment-rooms; the Council Chamber, and its handsome ante-chamber, were filled with luxurious hothouse plants; and the whole of the passages connecting the various apartments were uniformly lined with crimson and white draperies, and brilliantly lighted.

The general effect of the various apartments was heightened by the introduction of a great number of choice works of sculpture temporarily placed for the occasion, in addition to many fine works of art permanently attached to the building.

In the Court of Aldermen were the following works by Mr. Marshall, viz. Eurydice, Sabrina, the Whisper of Love, the Broken Pitcher, Little Red Riding Hood, and a Mermaid; and a Return of the Prodigal Son, by Mr. Theed. Mr. Baily's celebrated group of the Graces was also seen from the windows at the side of the room, in a recess fitted up for its reception, the foreground of which was occupied by choice plants and flowers: and the windows at the west end of the room afforded a view of another recess, occupied by Mr. Lough's fine colossal figure of Satan, meditating, after his expulsion from heaven, the destruction of the state of innocence and happiness which our first parents enjoyed in Eden. Upon this a full light was thrown, realizing the terrible ideal of the subject.

In a small ante-room which connects the Court of Aldermen with the Common Council Chamber, are placed the following works of art by Mr. Theed; viz. a figure of a Huntress, Narcissus at the Fountain, Psyche, Venus, Juno, Apollo, Minerva, and Ariadne.

The sculpture and paintings in the Common Council Chamber have a permanent place here. Among the former we remarked Chantrey's statue of George III., with busts of the Duke of Wellington, Lord Nelson, Granville Sharp, and R. L. Jones, Esq.; among the latter, Copley's Siege of Gibraltar, Northcote's Death of Wat Tyler, Opie's Murder of Rizzio, and several interesting portraits, including one of Alderman Boydell, to whose liberality the corporation were indebted for the gift of several of the pictures which are to be found in this and other rooms about the hall.

In the lobby to the Council Chamber, and which joins the corridor from the great hall near the entrance to the Court of Aldermen, were placed, in appropriate niches, the following figures by Mr. Marshall:—A Dancing Girl, a Group of Nymphs, and Hebe Rejected.

THE CRYPT.

This beautiful structure has long lain buried, and as it were obsolete, as a lumber-room and a cellar, beneath the eastern portion of the hall. It is considered the finest and the most extensive now remaining in London.* It is remarkable both for the elegance of its design, and the perfect condition of nearly all its members. It is divided into three aisles by clustered columns, from which spring the stone-ribbed groins of the vaulting, the principal intersections being covered with carved bosses of flowers or heads, and shields. The north and south aisles had formerly mullioned windows, now walled up; at the eastern end is an early English arched entrance, in good preservation. The height from the ground to the crown of the arches is about 13 feet. This interesting relic having been recently rescued from its undeserved obscurity, and undergone some restorations, has become an object of great attraction. On the present occasion it was prepared and fitted up in the style of an ancient baronial hall, and being provided with suitable furniture and embellishments, was specially appropriated for the service of her most gracious Majesty as a refreshment-room. For this purpose it was boarded all over, and covered with crimson carpeting; and around were oak tables, covered with the massive plate belonging to the Corporation and the leading City companies, relieved by vases and other artistic designs. In each of the recesses were handsome mirrors, measuring 9 feet by 6 feet; and around the walls was suspended a tapestry, copied from the famous Bayeux tapestry. This tapestry, many of our readers may be aware, represents the incidents of the conquest of England by William the Norman, and is so called from its being preserved in the Cathedral of Bayeux, in Normandy. This curious work is supposed to have been by the hand of Matilda, the wife of William, or of the Empress Matilda, daughter of Henry I. It consists of a web of linen 442 feet in length, and about 2 feet in breadth.

The crypt was lighted in an ingenious and picturesque manner. At each of the columns supporting the groined roof were figures in armour brought from the Tower for the purpose, who in either hand, supported torches emitting flames of lighted gas. Round the walls were other figures in armour, also bearing similar lights: and it may be curious to state, that these latter personages were no other than picked men of the City police force, who did double duty, both in lighting their Sovereign and watching over the safety of the valuable plate used on this occasion. To promote the ventilation of this part of the building, the modern arches (built after the Great Fire) were re-opened and pierced. This additional space was very tastefully laid out, in imitation of a winter; flower-stands, sculptured figures, and gas branches being placed in the recesses.

* A view and description of the crypt appeared in the ILLUSTRATED LONDON NEWS of the 24th of May last.

HER MAJESTY'S RETIRING-ROOMS.

The suite of rooms, fitted up by Messrs. Herring, for her Majesty's separate use, was exceedingly beautiful. In the boudoir at the south entrance, the walls were hung with Bannerman's new fabric of silver stars on light blue, and festooned lace draperies, lighted by large girandoles and wax candles. Roman drapery, attached to spear heads, enclosed a compartment for the toilet, draped with lace over blue satin. The furniture consisted of several very rich gilt console tables, with king-wood chairs covered in blue silk damask. Elegant lace *portiers* covered the doors; and a charming effect was produced by converting the windows and a division outside into a conservatory.

The spacious room for her Majesty, and that for her Majesty's private use during the evening, was most sumptuously fitted and furnished. The walls of the first were broadly fluted with Messrs. Bannerman's new fabric, in amber and silver, and the roof formed into a tent, with white and silver. Several large mirrors and gilt console tables ornamented the sides, and the tables and chairs corresponded. Her Majesty's room was also fluted with amber and silver wall hangings, with a rich festooned drapery of scalloped lace and crimson curtains of the same, and large curtains of tapestry in a splendid pattern of green, gold, and crimson, with which the carved and gilt chairs and sofas were also covered. Richly ornamented cabinets and tables ornamented the apartment. On the marqueterie table, inlaid with metal, forming designs after Flaxman, was placed Alderman Copeland's statuette group of "The Seasons," from the celebrated model, sold for two hundred guineas, from the Shuckborough collection. The Parian statuettes of the Royal children were also placed on the console.

Her Majesty's toilet, designed by Messrs. Herring, was composed of the rich silver satin, having the Royal Crown, initials, and branches of myrtle, embroidered in coloured silks, and deeply trimmed with gold-colour silk fringes, ropes, and tassels. The mirror, elaborately gilded, with ormolu candelabra, and the entire back enclosed with an elegant festooned drapery, composed of beautiful open lace of unique pattern.

The elaborately designed and carved Royal glass frame, with candelabras, exhibited by Messrs. Hering at the Crystal Palace, and permitted to be removed for this occasion, stood upon the left side of the toilet; and with the splendidly carved and gilded chair for her Majesty's use, completed an *ensemble*, which for taste and splendour is not often seen even in the boudoir of Royalty.

The whole of the decorations of the Guildhall upon this occasion were designed and arranged by Mr. Bunning, the City architect, and carried into execution by Mr. F. Fenton. By the courtesy of these gentlemen we have been furnished exclusively with all requisite information, to enable our Artist to complete the various illustrations.

ARRIVAL OF THE COMPANY.

The company began to set down as early as six o'clock, and from that hour until 9 o'clock there was a continued succession of arrivals. At eight o'clock the hall was so full, that it was with some difficulty that the dais or elevated platform, intended for the accommodation of her Majesty, could be kept clear. The leader of the band, Mr. Adams, endeavoured several times to start a polka or a quadrille, but all to no purpose; the vast assemblage was too much on the *qui vive* for the arrival of her Majesty, to think of dancing till she was there to grace the scene.

The Duke of Wellington arrived about nine o'clock. His Grace's private three-horse carriage was followed by the usual demonstrations of gratification.

Her Royal Highness the Duchess of Kent, attended by Lord James Murray, arrived shortly afterwards, and was followed by the Duke of Cambridge and Prince Edward of Saxe-Weimar.

ARRIVAL OF HER MAJESTY.

After a period of anxious expectation, at half-past nine o'clock it became known that her Majesty had arrived within ear-shot of the hall, the shouts of her loyal subjects penetrating the massive walls of the fine old building, and resounding above the clang of the musical instruments and the busy din of the human throng.

The Royal procession from Temple Bar had been one long ovation. The welcome of the citizens, and of the thousands who, having come from the country to witness the Great Exhibition, had taken this opportunity for extra sight-seeing, and for thanking the founder of their intellectual feast, was of the heartiest description. Illuminations blazed from every second or third house, and gay flags and streamers fluttered at frequent intervals, giving great animation to the scene. As the *cortege* advanced—with long files of carriages, and six of Home Guards—St. Paul's churchyard was as light as day, and Cheapside was in a roar of exultation as the procession turned at a slow trot down King-street.

On the Royal carriage drawing up at the entrance, the Lord Mayor, bearing the sword of state, advanced to receive her Majesty, who, upon alighting, graciously acknowledged the Chief Magistrate's proffered welcome. In addition to the Lord Mayor and Lady Mayoress, there were present to receive the Queen the six senior aldermen of the court, and six senior members of the Common Council on the entertainment committee.

Her Majesty's arrival was announced by a flourish of trumpets.

The Queen entered the hall resting on the arm of the Prince Consort, and preceded by the great officers of State, by whom she was accompanied. The Lord Mayor and Lady Mayoress walked immediately before the Royal pair, the former bearing the City sword.

Her Majesty wore a white satin dress, embroidered in gold, trimmed with gold, silver, and white satin ribbons, richly ornamented with diamonds. The head-dress was composed of poppies, golden oat and wheat ears, ornamented with diamonds.

His Royal Highness Prince Albert wore his uniform as Captain-

General and Colonel of the Hon. Artillery Company, with the ensigns of the orders of the Garter and the Golden Fleece set in diamonds.

The Duke of Norfolk wore the uniform of the Master of the Horse, and carried his *baton* as Earl Marshal of England. His Grace and the Marquis of Abercorn wore the insignia of the most noble Order of the Garter.

The Marquis of Breadalbane wore the full official dress of Lord Chamberlain, with the ensigns of the most ancient Order of the Thistle.

Viscount Combermere wore the uniform of his Regiment (Life Guards), with the ensigns of the Orders of the Bath, the Guelphic and the Portuguese Tower and Sword; and the Marquis of Donegal and Lord Elphinstone both wore the Grand Cross of the Guelphic Order.

After crossing the hall, her Majesty ascended the steps leading to the corridor, from which the various courts are entered. After making the circuit of these rooms, her Majesty returned to the hall, and proceeded up the north side to the throne at the eastern end.

The enthusiasm of the company, which had been hitherto decorously restrained, now burst forth, and the heartiest demonstrations of loyalty greeted her Majesty's progress up the hall.

Her Majesty having taken her seat upon the throne, a quadrille was formed, in which the Duke of Cambridge danced with the Marchioness of Douglas, and his Serene Highness Prince Edward of Saxe-Weimar with the Marchioness of Ailesbury.

A second dance followed, after which her Majesty expressed to the Lord Mayor her gracious desire to proceed round the hall, which she immediately did, and thus added materially to the gratification of the company.

After her Majesty had returned to the throne, the company were permitted to file before the Queen and the Prince and make their obeisance in passing. This ceremony occupied a considerable period, and at its conclusion several quadrilles followed, in which the most distinguished of the guests took part.

THE ROYAL SUPPER.

At twelve o'clock her Majesty and the Royal party were conducted by the Lord Mayor to the crypt under the hall, where a magnificent supper was served. The Queen and the Prince, on entering, evinced the highest gratification at the novelty of the scene which presented itself. The Queen was conducted to a seat by the Lord Mayor, who stood near her Majesty during the banquet.

Of the *vecherché* character of the entertainment some idea may be formed by the following copy of the bill of fare of the Queen's supper, which, as well as the general refreshments, were furnished by those eminent caterers, Messrs. Staples, of the Albion tavern:—

THE ROYAL TABLE.

Purée de Volaille à la Reine.	Bordure de Légumes à la Russe.
Cailles à la Macédoine.	Cotelettes d'Agneau aux Petits Pois.
Noix de Veau à la Gelée.	Saumon au Beurre de Montpellier.
Aspic de Lavraut à la Belle-Vue.	Boudin de Foies Gras aux Truffes.
Macronnaise de Volaille à la Ravigote	Jambon de Mayence au Vin de Malbec
Pâté de Canetons à la Pompadour.	Cochon de Lait à la Chinoise.
Potage à l'Aurore.	

Pâté Monstre à la Cité de Londres.
Hure de Sanglier de la Forêt des Ardennes.
Galantine Impériale à l'Amazone.
Pyramide de Volaille à l'Albion.

Buisson de Crevettes.	
Compote de Pêches aux Amandes.	
Gâteaux à la Artois.	
Mayonnaise Tranchée à la Gelée.	
Fond Iettage à l'Orange.	
Baba en Surprise.	

Boisson de Truffes de Périgord.
Soddoire de Fraises.
Pain de Cérises.
Bavaroise de Groseilles.
Compote d'Ananas
Croque-en-Bouche à la Crème.

The wines included Amontillado of curious antiquity, and which might unquestionably have been designated the perfection of its class; Imperial of the vintage 1834, from the celebrated bin-cask of the Duke of Nassau's steinburgh cabinet, sherry, 105 years old, of matchless quality, which was bottled for the especial requirement of the Emperor Napoleon, and was supplied to the Imperial cellars at a cost of £600 sterling the butt; Muscatel and Tavarete the most *recherché*—both these latter wines were brought expressly as presents for the Royal table by Mr. Peter Domecq, from his vineyards at Macharnudo: with champagnes (Sillery, and sparkling of the most choice growths), and a red still wine, but little known to fame, grown on a favoured spot in the vineyards of Bourgy, and of extraordinary purity and delicacy. The strawberries were grown by Mr. Cuss, Bates, of East Mousley, being Myatt's "British Queen." The wine-glasses (designed by Mr. J. Staples, and made for the occasion) had the Royal crown, the City shield, and the globe, as typifying all nations, delicately engraved, with intervening groups of corn, fruit, and flowers, emblematical of the various portions of Europe. The doyleys were of pale green Genoa velvet, richly embroidered with devices of peace and plenty: the Royal crown in the centre, surrounded with the national flags of England, France, Austria, Turkey, the United States, and the arms of the City of London.

The dessert plates, which in colour were of Daniels' recently discovered "Rose du Barry," had the Royal arms, and those of the Prince Consort and the Prince of Wales, on either side: the arms of the City and of the East India Company, and a surrounding wreath of the rose, shamrock, and thistle. These were very splendid specimens of Colebrook Dale manufacture, and were adorned with exquisitely pencilled drawings.

The table cloth was of delicate pale gold satin, with an embossed border, showing the initials of her Majesty and Prince Albert, and the arms of the City of London in relief.

The napkins were of the finest Scotch damask, tastefully embroidered, and trimmed with lace.

Amongst the many and varied evidences of the almost unlimited resources and appropriate taste of the Messrs. Staples in their supply for the Royal table, was an unique specimen of *cuisine*, as of the mediæval age, in a boar's head (laboriously and most tastefully decorated, and having the following quaint rythm of Wynkyn de Wode, very beautifully illuminated in ancient English character on vellum, suspended on a banner between the tusks

Caput apri defero
Reddens laudes Domino.
Ye Bore's head in hande bryng I
With garnisshed gay and rosemary;
I pray you all synge merrille,
Qui estis in convivio.
Ye Bore's head, I understande,
Is the chefe service in this lande;
Looke wherever it be fynd,
Servis cum cantico.

The *tout ensemble* of the feast, for such it may rightly be called, was one of elegant profusion. There was nothing wanting—nothing to be desired—nothing to be asked for. The whole banquet went off with the ease and quiet of a supper for a small party at a private house. No one could have imagined that a body of not less than 2000 persons were being supplied with supper at the same moment. The same good taste and the same plentiful supply pervaded every refreshment-room, in all of which we observed an equal care for the civic guests on the part of the Messrs. Staples. There were many articles of very elegant formament displayed in these apartments, amongst which we took especial notice of a *papier maché* platean, manufactured by Messrs. Jennens and Betteridge, of London and Birmingham, for the Pacha of Egypt.

HER MAJESTY'S DEPARTURE.

After supper, the Queen left the hall, conducted as upon her arrival, and returned to Buckingham Palace, accompanied by the cheers of an immense assemblage of spectators who thronged the streets until a very late hour.

The civic festivities were renewed after the Royal departure, and it was after six o'clock before the hall was deserted. We understand there were upwards of three thousand guests at this magnificent and interesting entertainment.

We have reason to believe, though we are not authorised officially to announce the fact, that the usual precedent of all former Royal visits to the City will be followed in the present instance, and that the Lord Mayor will be honoured with a baronetcy forthwith.

THE PROCESSION OUT OF DOORS.

From an early hour in the afternoon, the Park, and the streets throughout the line of road, were crowded with people of all classes anxious to catch a glimpse of the procession, and to cheer its progress.

The Queen and Prince Albert went in semi-state, occupying, with their suites, eight carriages: the footmen in state liveries, and the horses richly caparisoned.

The route of the procession on leaving Buckingham Palace was through St. James's Park into Pall-Mall, along Cockspur-street, Trafalgar-square, Strand, Fleet-street, Ludgate-hill, St. Paul's Churchyard, Cheaps de, King-street, to the Guildhall

Her Majesty having intimated her desire that the old custom of presenting the keys of the City to the Sovereign at the City gates should be dispensed with on this occasion, the Temple-bar was not closed, and the Lord Mayor awaited the arrival of his Royal guests at the door of the Guildhall.

The entire line of road from Buckingham Palace to the Guildhall was kept by the police and the 1st and 2nd Life Guards. The approach to the Royal entrance of the Hall, in King-street, was lined by the corps of the Honourable Artillery Company, whose band, with that of the Life Guards, was stationed in the open space between the church of St. Lawrence Jewry and the Irish Chamber.

The order of the procession is thus given by the *Court Newsman* of Thursday:—

Her Majesty went in state, last evening, to the entertainment given to the Queen by the City of London, at Guildhall. The Royal procession left Buckingham Palace, at five minutes past nine o'clock, in the following order:—

The First Carriage,

Conveying a Gentleman Usher, Mr. Arthur Blackwood; a Gentleman Usher of the Privy Chamber, Sir Frederick Smith; the Exon of the Yeomen Guard in Waiting, Captain Phibbs; and the Page of Honour in Waiting, Mr. George Grant Gordon.

The Second Carriage,

Conveying the Groom in Waiting, Sir Edward Bowater; the Groom in Waiting to the Prince, Lieut.-Colonel Francis Seymour; the Field Officer in Waiting, Colonel Bentinck; and the Silver Stick in Waiting, Colonel M'Donall.

The Third Carriage,

Conveying the Equerry in Waiting, Lord A. Charles Fitzroy; the Equerry in Waiting to the Prince, Lieut.-Colonel Francis Hugh Seymour; the Treasurer of the Household, Lord Marcus Hill; and the Clerk Marshal, Lord Alfred Paget.

The Fourth Carriage,

Conveying the Vice-Chamberlain, Lord Edward Howard; the Captain of the Yeomen Guard, the Marquis of Donegal; and the Captain of the Hon. Corps of Gentlemen-at-Arms, Lord Foley.

The Fifth Carriage,

Conveying the Bedchamber Woman-in-Waiting, the Viscountess Forbes; the Lord-in-Waiting, Lord Elphinstone; and the Master of the Buckhounds, the Earl of Bessborough.

The Sixth Carriage,

Conveying the Maids of Honour in Waiting, the Hon. Amelia Murray and the Hon. Lucy Kerr; the Groom of the Stole to the Prince, the Marquis of Abercorn; and the Gold Stick in Waiting, Viscount Combermere.

The Seventh Carriage,

Conveying a Lady of the Bedchamber, the Marchioness of Douro; the Lord Steward, the Marquess of Westminster; and the Lord Chamberlain, the Marquis of Breadalbane.

The Eighth Carriage,

Conveying her Majesty the Queen, his Royal Highness the Prince Albert; the Lady of the Bedchamber in Waiting, the Countess of Gainsborough; and the Master of the Horse, the Duke of Norfolk.

Her Majesty was escorted by a detachment of Life Guards.

The cheering along the whole line of route was immense—spontaneous, long-continued, and of a fullness of volume which did credit to the hearts and lungs of the dense masses who contributed to it. All the parish churches sent forth merry peals the while, producing a concert most gladsome, we have no doubt, to our amiable and beloved Sovereign's ears. Her Majesty seemed highly delighted with her reception, and bowed and smiled repeatedly. The crowd did not disperse till after her Majesty's return, when the same manifestations of loyalty and welcome were repeated, if possible, with increased intensity and fervour.

THE ILLUMINATIONS.

On taking the chair on Saturday, at the Mansion House, the Lord Mayor said:—"In reply to the several applications which have been made to me by bankers, merchants, and others who are desirous of expressing their feelings of loyalty and devotion by illumination on the occasion of her Majesty's gracious visit to the City, on the 9th instant, I am anxious publicly to state that I consider that such a demonstration would be peculiarly appropriate, so far as it embraces the line of streets through which her Majesty will pass from Temple Bar to the place of entertainment. As it is intended that Temple Bar shall be an object of brilliant display, I trust that a spirit of friendly conclitat on will characterise the taste of my fellow citizens throughout the line I have indicated. It is my intention to illuminate the Mansion House."

In accordance with this intimation the streets throughout the whole line of the Royal procession, as well as many adjacent streets, were illuminated on Wednesday evening upon a scale of magnificence which we believe has never been equalled. Each seemed to vie with its neighbour in bringing its meed of tribute to the general rejoicing. The public buildings, of course, were all illuminated with devices of importance; but the greater portion of the houses of individuals, particularly in the City, also displayed their star, or their Royal initials, while some of them exhibited devices of greater pretensions appropriate to the occasion. In the midst of this blaze of light, the national banners floated from many a window and housetop, as well as the spires of the churches—the whole producing a scene magnificently gay. We have only space, however, to notice in detail the more important public buildings.

TEMPLE BAR was magnificently illuminated.—(See Engraving in the Number published with the present.)

ST. PAUL'S SCHOOL, St. Paul's Churchyard.—The front of this extensive building was most magnificently illuminated, and also attracted great attention. The devices consisted of an immense imperial crown, measuring 12 feet square, with two wreaths of laurel, each 25 feet in length, two stars of Brunswick, about 12 feet in diameter, and the initials "V. R." in variegated lamps.

THE MANSION-HOUSE.—Large imperial projecting crown, with branches of laurel, below which was a large star of Brunswick, with the Motto and Order of the Garter, two immense wreaths of laurel, and the initials of her Majesty and Prince Albert. The whole of this extensive display in brilliant gas-jets.

THE BANK OF ENGLAND, Threadneedle-street.—This building presented a very novel and elegant display. Along the front of the building, at the top of the several lamp-posts, was placed a brilliant star of Brunswick, each of these stars being united to each other by festoons formed of brilliant gas-jets. His design was copied from

THE ROYAL EXCHANGE, which also attracted great interest last night, and the illumination had a very singular and striking effect, and, from the large area in front, was seen with great advantage. The pediment and architectural details were beautifully defined by pure white lamps, and underneath the pediment were the words, "The earth is the Lord's, and the fulness thereof," this inscription being upwards of 90 feet in length, the letters being three feet in depth. The whole of the columns were intertwined with wreaths of lamps, and the capitals were also most tastefully decorated.

THE EAST INDIA HOUSE, Leadenhall-street. The architectural details of the pediment most tastefully defined with rows of lamps; the lower part of the same terminated by festoons and tassels of white lamps. A large imperial projecting crown, the initials of "V. A.," and two stars of Brunswick in richly-coloured lamps, with immense wreaths of laurel, &c., the whole surrounded by a true lover's knot.

GUILDHALL. A splendid shield of coloured glass, quartered with the arms of England and Ireland, surrounded by the Order and motto of the Garter, with the supporters of the arms of England (lion and unicorn rampant), beautifully defined, and surmounted by the Imperial crown; beneath the national emblems of the Rose, Thistle, and Shamrock, with the motto "Dieu et mon Droit." The whole in brilliant gas.

THE SOUTH SEA HOUSE, Threadneedle-street. The initials "V. A.," a large imperial crown, and wreaths, in gas.

THE GROCERS' HALL, Princes-street.—Rows of pure white lamps, extending along the whole front of the building; the Royal initials, "V. A." and large projecting imperial crown in coloured lamps.

MESSRS. CALDECOTT, POWELL, and WILLCOCKS, Cheapside.—A brilliant star, the City arms in the centre, with the letters "V." and "A." placed on either side.

MR. D. GELLON, Cheapside. A brilliant star, the City arms, the letters "V. A." flanked by an elegant wreath, all in gas. A large flag displaying a Celtic motto, signifying "God's blessing upon the fair Highland Queen," and other flags.

BURGESS' ITALIAN WAREHOUSE, Strand.—"V. R." with a crown between, surmounted by a star in gas, and a flag bearing the inscription, "England's Queen: may God bless her, and give her long life to reign in the love and respect of her people."

ACKERMANN'S REPOSITORY OF ARTS. A transparency; with medallion portraits of her Majesty and Prince Albert, "V. A.," and a variety of allegorical and national devices.

ROYAL RECORDS OF THE CITY,

FROM THE CONQUEST TO THE PRESENT TIME.

THE Citizens of London, at all periods of his history, have been honoured with frequent visits from their Sovereign of the day, as well as from many foreign potentates, whom it was always customary to entertain with regal magnificence. In early times, moreover, and particularly during the troublous period of the Wars of the Roses, and again in the times of Charles I. and II., the chief men of our ancient City exercised a very direct influence upon the destinies of the Crown and the order of succession. They were, moreover, rich, as they still are, and Kings and Princes being often in want of money, the application for it came very naturally to the Mayor and citizens of London, who sometimes granted what was required of them, generally purchasing certain franchises or important privileges in return; sometimes stoutly refused it, risking all the consequences of the disfavour of a powerful and almost absolute Monarch.

It is easy to conceive, that, when London, speaking of the City within the walls, was the dwelling-place of merchant princes, and when the King himself kept court within the Tower, City pageants were much more frequent, much more intimately mixed up with the state and circumstance of the Court, than we can ever expect to see them again. Through a long series of centuries the coronation procession of each new Monarch was made from the Tower, through the City, to Westminster—a custom which, though omitted in the case of Charles I., on account of the plague, was observed so late as the coronation of Charles II., since which it has been altogether discontinued with the altered residence of the Court. In those processions the Lord Mayor and Aldermen bore an important part, the former having the office of cup-bearer to the newly-crowned Monarch, and having, further, the privilege confirmed to him of having his mace borne before him in the procession. This, though it may seem a very slight, is a very high distinction, the next in dignity to it being that of the Mayor of York, who is privileged to bear his mace before the King, but not to have it carried by another.

In more recent times, seeking to establish the supremacy of the House of Hanover on the throne, the citizens of London have gradually taken less and less part, directly, in the processions resulting from a demise of the Crown. They have suffered themselves to take their course, content to pursue their industrial vocations in peace and security, under the protection of a wisely-regulated constitution. The pageants which they have displayed from time to time in our day, whilst they have certainly equalled, if not always surpassed, in splendour, those of their ancestors, have been purely of a festive and hospitable character—tributes of honour to their King and his august allies, and to distinguished individuals for eminent services in the field and the senate.

Enough has been said in the above few lines to suggest the themes of varied interest which an historical sketch of City Royal festivals and ceremonies from the earliest times to the present day could embrace, and the striking illustration which it would afford of the political condition and social habits of the nation at various periods; and having said thus much by way of preface, we shall commence our task with the days of William I., surnamed "the Conqueror," whose claim to the latter title, by the way, has been disputed, and may still be questioned; indeed, we are strictly informed, that in former times the people were used to reprehend any gentleman at the Bar who happened to give him the title of William the Conqueror, instead of William the First. Certainly, as far as the Londoners were concerned—and they at that time greatly influenced the fate of the kingdom—he was no conqueror, but received as Sovereign upon compact.

I.—FROM WILLIAM I. TILL THE TIME OF THE TUDORS.

William was actually arrived in Southwark, when the Londoners sallied out upon him, and fought so resolutely, that, though they were repulsed by five hundred of the Norman horse, yet William was convinced that they would not be easily frightened into a submission. Thinking, therefore, that the winter season, which was now advanced, was an improper time to lay siege to a place of so much importance, he laid Southwark in ashes, and marched to reduce the western counties, having first prevailed on the clergy to espouse his cause, and endeavour to engage the people in his interest, and such was their influence, that, according to Rapin, they prevailed on the citizens to make an abject submission to the Conqueror. As soon as this defection was known to Edwin and Morcar, those noblemen consulted their own safety by retiring into the north of England, while the successful William began his march towards the City, into which he was received by the magistrates and principal citizens, who delivered to him the key of the City gates, acknowledged him their Sovereign, and, in conjunction with the nobility and gentry, entreated his acceptance of the crown. The example of the capital was followed by the rest of the kingdom, so that in a short time William was in peaceable possession of the throne.

The Conqueror soon after set out to visit his Norman dominions; and at his return from thence, in the second year of his reign, was received into London with a solemn procession; in return for which he granted a charter to the citizens in their own language, a mighty favour at that time, when the French tongue began to prevail over all. This charter consists of four lines and a quarter, beautifully written in the Saxon character, on a slip of parchment of the length of six inches, and breadth of one, which is preserved in the City archives as a very great jewel. The following is an exact translation thereof:

William the King greets William the Bishop, and Godfrey the Portreve, and all the Burgesses within London, both French and English. And I declare, that I grant you to be a law-worthy, as you were in the days of King Edward; and I grant that every child shall be his father's heir after his father's days; and I will not endure that any person do you wrong. God keep you.

On the death of William Rufus, in 1100, the throne was seized by his younger brother, Henry, who was crowned in London within five days afterwards, and, as a reward for the ready submission of the Londoners to his usurped authority, he granted to the City an extensive charter of privileges.

On the return of Richard I. to England, in 1194, after his unjust imprisonment by that arch-traitor Emperor Henry VI., he was received into London with the greatest pomp and demonstrations of joy by the unexampled loyalty of the citizens. The richness of the cavalcade was so excessive, that it occasioned a German nobleman, who attended the King, inadvertently to say, that, had the Emperor known the immense wealth of England, he would have insisted on a much greater ransom.

Richard, to wipe off the stain of his imprisonment, resolved to be crowned a second time. At this coronation the citizens of Winchester disputed with those of London the right to the office of Chief Butler, though the same had been executed by the Londoners at the late coronation. But a free gift of 200 marks to the King obtained his determination of this privilege to the latter. Soon after, the King, in consideration of the good deportment of his loyal and faithful citizens of London during his long absence, granted them a new charter, with additional privileges, and a full confirmation of all its liberties, rights, and immunities.

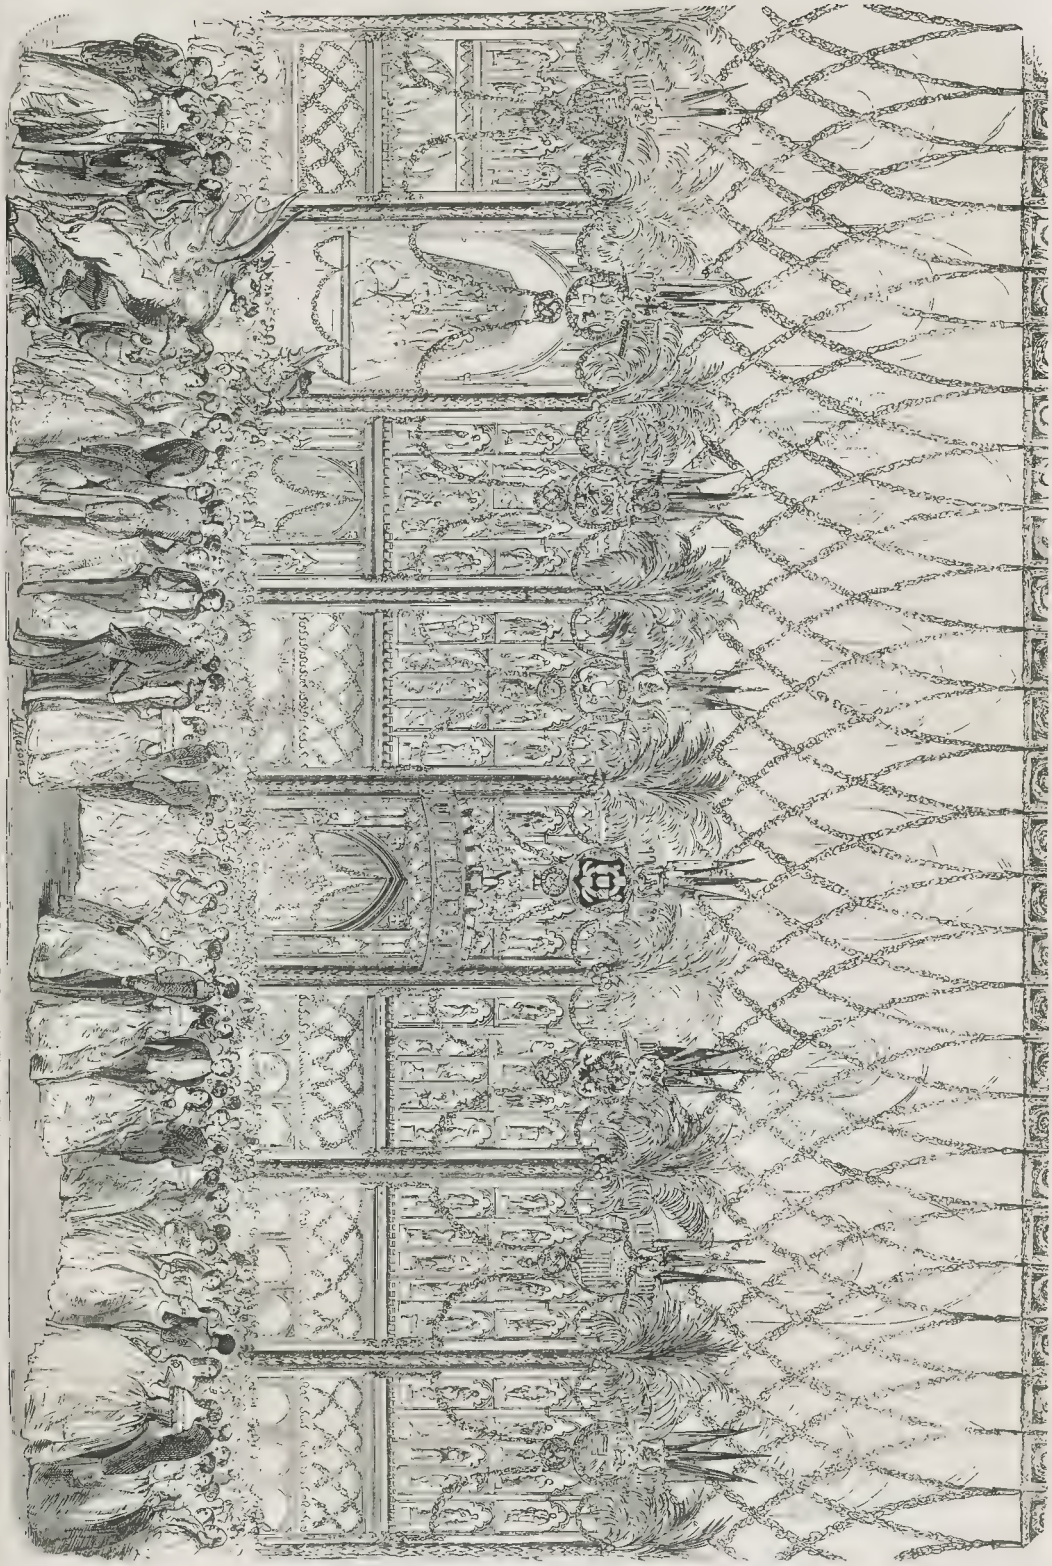
In the year 1205, the Emperor Otho, the King's nephew, arrived in London, and was received by the citizens in a magnificent manner.

King Henry III. with Eleanor his Queen, whom he had just married at Canterbury, made a public entry into London on the day appointed for the Queen's coronation. "The citizens," says Stow, "rode to meet the King and Queene, being clothed in colours, their horses finely trapped in array to the number of 360, every man bearing golden or silver cups in their hands, and the King's trumpeters before them sounding. The Cite was adorned with silkes, and in the night with lamps, cressets, and other lights without number, besides many pageaunts and strange devices which were showed. To the coronation assorted so great a number of all estates, that the Cite of London was scarce able to receive them. The Archbishop of Canterbury did execute the office of coronation; the citizens of London did minister unto his brothers: the citizens of Winchester tooke charge of the kitchen; and other citizens attended their charges."

In 1248, Baldwin, the Greek Emperor, arrived at London, where he was received in a very pompous manner by the Mayor and citizens.

On the death of Henry the Barons assembled at the New Temple, and appointed a Regency to govern the kingdom during the absence of Edward, who was then in Sicily, on his return from Palestine. Shortly afterwards, the new King, by a letter directed to the Mayor, sheriffs

ARRIVAL OF HER MAJESTY AT THE GUILDHALL.



THE BALL IN THE GUILDHALL.—SOUTH SIDE.

and commonalty of London, ordered the Flemings, at whose conduct he was offended, to be expelled the City, and charged the magistrates to be careful to preserve the peace. In July, 1274, Edward landed in England with his Queen; and on their arrival at London, they were received with great rejoicings and pomp. "The outsides of the houses were hung with the richest silks and tapestry; the conduits ran with the choicest wines, and the most wealthy citizens scattered gold and silver profusely among the populace." On the 19th of the following month, Edward and his Queen were crowned at Westminster; and "at this coronation 500 great horses were turned loose, catch them who could."

In this reign we have the first recorded instance of a pageant in honour of a victory. Stow records it thus:—

"The citizens of London hearing of the great victorie obtained by the King against the Scottes, made great and solemne triumph in their citie, every one according to their crafte; especially the fishmongers, which, with solemne procession, passed through the Citie, having, among other pageants and shows, four sturgeons, gilded, carried on foure horses; then foure salmons of silver on foure horses; and after, sixe and fortie knights armed, riding on horses, made like luces of the sea; and then St. Magnus, with a thousand horsemen. This they did on St. Magnus's day, in honour of the King's great victorie and safe returne."

This was so pleasing to the King, that he commanded the aldermen and principal citizens to repair to Westminster on Easter Wednesday, where, by the advice of his counsel, his Majesty restored to them the power of electing their chief magistrate (the Mayor), which had been taken from them by Henry III., in revenge for their tending the crown to Louis of France, just before his accession); they having previously paid a fine of 23,000 marks into the King's exchequer.

On the arrival of Philippa of Hainault, Queen of Edward III., in 1328, she was received with great pomp, and magnificently entertained by the Mayor and citizens, a reception with which she was much delighted.

In the year 1357, there was a grand triumphal procession in honour of the entry of Edward Prince of Wales, commonly called the Black Prince, on account of his black armour; who, having routed the French army at Poictiers, and taken King John prisoner, brought him to London, and was met in Southwark by five thousand citizens all mounted upward on horseback, richly accoutred. King John, as the captive, was clothed in Royal apparel, and mounted on a stately white courser, as a symbol of sovereignty. Behind, on a little black galloway, rode the victorious hero Prince Edward. The Mayor, Aldermen, Sheriffs, and the several companies in their formalities, richly pageanted, met them at the foot of London-bridge. And the streets through which the triumph passed were adorned with the richest tapestries, and with plate, silks, and other furniture, to exhibit a view of their riches, and with such quantities of bows, arrows, shields, helmets, coats of mail, swords, spears, and other armour and weapons for war, exposed in balconies, shops, windows, &c., as was never before seen collected together, and conveyed a proper idea of the strength and martial genius of the English. This cavalcade lasted from three in the morning till noon.

In 1363, we read that the Kings of Scotland, France, and Cyprus came upon a visit to King Edward, who, together with the said Kings, the Prince of Wales his son, and most of the nobility, were sumptuously entertained at dinner by Henry Yeard, the late Mayor (he was Mayor, we find, in 1356), which the chronicle says "ought not only to be commensurate to the praise of that public spirited citizen, but also to the honour of the City in having had so generous and worthy a chief magistrate." Why the existing Mayor forewent his privilege of entertaining Royalty on this occasion, we are not informed; probably it was his poverty and not his will consented" to it.

In 1377, a remarkable mummery was made by the citizens of London, for the sport of the young Prince Richard, next to the King:—

"On the Sunday before Candlemas, in the night, 140 citizens disguised and well horsed, in a mumming, [illegible] buts, cornets, shalmes, and other [illegible] lights of wax, rode from Newgate, through [illegible] Southwark and so to Kennington, besides Lambeth, where the young Prince remained with his mother and the Duke of Lancaster his uncle, the Earls of Cambridge, Hertford, Warwicke, and Suffolke, with divers other Lords. In the first rank did ride forty-eight in likeness and habit of esquires, two and two together, clothed in red say, with long sleeves, and vizors on their faces. These maskers, after they had entered the manor of Kennington, alighted from the horses, and entered the hall on foot; which done, the Prince, his mother, and the Lords came out of the hall, whom the masters did salute; shewing by way of dice on the table their desire to play with the Prince, which they so handled that the Prince did always winne when he came to cast at them. Then the mummers set to the Prince three jewels, one after the other, which were a bowle of gold, a cup of gold, and a ewer of gold; which the Prince wonne at three casts. Then they set to the Prince's mother, the duke, the earls, and three other Lords, to every one a ring of gold, which they did also win. After which they were feasted, and the music sounded, the Prince and Lords took the one with the other, and the mummers, who did also dance; which jollity being ended, they were again made to drink, and then departed in order as they came."

The young Prince was at this time only ten years old and, succeeded to the throne of his grandfather in the same year, viz. 1377.

In 1392 the King held a solemn tournament in London, which many princes and nobles from France, Germany, and the Netherlands attended. The jousts were held in Smithfield, open house being kept the four days they lasted at the Bishop's palace, at the King's expense. "Soon after, however, his Majesty sent to the Londoners, requesting to borrow of them one thousand pounds, which they stoutly denied, and evill entreated, beate, and neer hand slew a certaine Lombard that would have lent the King the said summe; which, when the King heard, he was marvellously angried." The King's resentment was shown in the usual manner threatenings, revocation of privileges, liberties disanulled, and so forth; till at last the citizens submitted themselves to the King's pleasure, offering ten thousand pounds," which, eventuall, was graciously accepted, the King now at Windsor, on sending it "to London, to comfort the citizens" with his Royal presence. Stow writes:—

"The King, therefore, as he came from Shene in Surrey, to London, with Queen Anne his wife, on the 29th of August, the principall citizens all in one livery, to the number of 400 horsemen, rode to meet them at Wandsworth, where, in most lowly wise, they submitted themselves unto his grace; beseeching him of his speciall pardon in all such thinges as they before had offended, and by reason whereof the Citie, in the name of the whole citizens, instantly required him, that he would of his great bounty take such paine upon him as to ride through his chamber of London, to which request he graciously consented: so he held on his journey till he came to Kingston upon Thames, Southwarke, where they were received with procession of Robert Braybroke, Bishop of London, and all the clergie of the Citie, who conveyed them through London; the citizens of London, men, women, and children, in order meeting the King at London Bridge, where he was by them presented with two fayre white steedes, trapped in cloth of golde, parted of red and white, hanged full of silver belles; the which present he thankfully received; and after he had on his way through the citie toward Westminster. And as they passed the Citie, the streets were hanged with cloth of golde, silver, and silk. The conduite in Cheape ran with red and white wine; and by a childe, angel-like, he was presented with a very costly crowne of golde, and the Queene with another. A table of the Trinitie, in golde, was given to the King, value worth eight hundred pound; and another to the Queene, of Saint Anne, because her name was Anne; with divers other gifts, as horses, trappers, plate of golde and silver, clothes of gold, silke, velvets, basons, and ewers of gold; also gold in coyne, precious stones, and jewels so rich, excellent, and beautiful, that the like, either in price or gift not well be esteemed; and so the citizens recovered their ancient customes and liberties."

The Mayor having received advice of the King's arrival at Dover, with his young consort Isabella, daughter of Charles VI. of France, he, with his brethren the aldermen, accompanied by a select body of citizens well mounted and dressed in one sort of apparel, with a symbol of their respective mysteries richly embroidered on each of their sleeves, met them on Blackheath, where the Recorder, on behalf of the City, in a congratulatory oration, joyfully welcomed and conducted them to Kennington, from whence, soon after, the young [illegible] rage, therefore called the [illegible]

London with the utmost pomp and [illegible] [illegible] of spectators was so exceed ingly great, that nine persons were crowded to death on London Bridge, among whom were the Prior of Tiptree in Essex, and a worthy lady of Cornhill. And on the following day the Queen passed through the City with the greatest magnificence to Westminster.

Passing over the corona ion of Henry IV., in the following year (1400, [illegible] the Greek Emperor, John Lascaris Paleologus, arrived in England to solicit succour against the Turks; when, we are informed, "the King and principal nobility met him in great state at Blackheath, and conducted him to London, where he was received with great pomp by the corporate officers and citizens."

Another victory, and consequent rejoicing. We quote from Fabian's "Chronicle:"

In 1415, as Nicholas Wotton was riding to Westminster to qualify himself for the office of Mayor, he received from one of the King's messengers a letter, acquainting him of the great victory obtained by the King at Agincourt, in France; and returning from Westminster, accompanied by the Bishop of Winchester, Lord High Chancellor, &c., they repaired to St. Paul's Cathedral, where "Te Deum" was sung with great solemnity; and, on the day following, a very pompous and solemn procession was performed by the Queen, nobility, clergy, Mayor, aldermen, and the several corporations of the City, with the utmost devotion, from St. Paul's Church to Westminster, on foot; where the illustrious company made a great oblation at the shrine of St. Edward, and returned in triumph.

The King soon after returning from France, with great numbers of the French nobility his prisoners, was met on Blackheath by the Mayor, aldermen, and Sheriffs of London, in scarlet robes, attended by 360 of the principal citizens mounted on stately horses, richly accoutred; and at St. Thomas's Watering he was met by a solemn and pompous procession of the London clergy, with rich crosses, magnificent copes, and massy censers; and the City, on this joyful occasion, was embellished in a very sumptuous manner with rich tapestry, containing the glorious actions of his Majesty's predecessors, with a beautiful variety of stately pageants, in some of which sat very amiable children, dressed in imitation of angels, chanting praises to the eternal King, to whom Henry justly and humbly ascribed all the honour and glory of the late great victory. During this magnificent cavalcade, the City conduits ran with divers sorts of wine, for the entertainment of the populace; and, the day following, the Mayor, aldermen, and citizens presented the King at Westminster with £1000 in gold, in two rich basins of the same metal and value.

On the 7th of May following the citizens went out with great pomp to receive the Emperor Sigismund, who came over, out of a pious design, to make peace between England and France.

In 1421 a splendid banquet was given by the City to Henry V. and his Queen, on the occasion of his conquests in France; when Sir Richard Whittington, in addition to the luxuries provided for his Royal guests, is said to have gratified and astonished the King by throwing into a fire bonds in which his Majesty was indebted to the citizens to the amount of £60,000.

II. - HENRY VII. AND HENRY VIII.

Taking now a leap over the times of the Wars of the Roses (fearful times, certainly, but unattended with anything striking in the way of civic pageantry), we come to the accession of Richmond as Henry VII., who, six days after the battle of Bosworth-field, entered London, and was received by "the Mayor, magistrates, and City companions" with great pomp.

On the 12th of November, 1501, the Princess Catherine of Spain was received with great state and rejoicing, on her arrival to marry Prince Arthur, bluff Hal's elder brother. At London Bridge "was ordered a costly pageant of St. Katherine and St. Ursula, with many virgins; from thence she rode to Gracechurch, where was ordained a second pageant, from thence to the conduit in Cornhill, where was another pageant. The great conduite in Cheape ran with Gascoyne wine, and was furnished with muscle. Against Soper-lane end was the fourth pageant. At the standard at Cheape was ordered the fifth pageant. At Paul's-gate was the sixt pageant; by which the Princess rode through Paul's Churchyarde into the Bishop of London's Palace, where she and her people were lodged." Two days after [illegible] to the Prince, both clad in white satin, by the Archbishop, assisted by the Bishops of London and Lichfield. "Wonderful," says Stow, "was it to behold the [illegible] and worn on that day, with poisant [weight.] chains of gold, &c. The marriage feast took place in the Bishop's palace, to which the Mayor and aldermen were invited, and conducted by Sir Reginald Bray, the steward of the Prince's house.

In 1505, the Archduke Philip, in right of his consort, having succeeded to the crown of Castile, set out with his Queen from Flanders with a considerable fleet on his way thither; but meeting in the Channel with a violent storm, was driven into Weymouth, from whence he came by land to Windsor, to pay his respects to King Henry, who from thence brought him to London to see his capital city, where they were entertained by the Mayor and citizens with a pomp and magnificence proportionable to the ancient splendour of their guests.

In June, 1509, Catherine, Arthur's widow, is married a second time, at Greenwich, to Henry VIII., after his accession to the throne, and on the 24th of the same month their Majesties were crowned at Westminster, with extraordinary pomp and splendour. The City, on this occasion, made doing honour to the procession with splendid decorations of brocade and gold, and incessant cries of joy. "During this whole reign, indeed," says Hall, in his chronicles, "the citizens indulge in all splendid pageantry and joyful shows, and the arts and sciences are patronised by the Court, and became a character'stic feature of the age.

In 1520, the Emperor Charles V. came into England to pay a visit to King Henry, who received him at Dover, and conducted him to Greenwich, where he was received by the Queen, her ladies, and nobility; he was conducted by their Majesties and the nobility to London, which on that occasion was embellished with the most rich and pompous decorations that could be devised, with a variety of magnificent pageants; and as those great Princes approached the City, they were received by the Mayor, aldermen, and Sheriffs in their formalities, attended by a great number of the principal citizens on horseback, richly accoutred; by whom they were conducted through the City to the imperial apartments in Blackfriars; and the Princes and nobility of his retinue to theirs in the new palace at Bridewell.

On Christian, King of Denmark, with his Queen (niece to Queen Catherine), came into England to pay the King and Queen a visit; and being arrived in London, they were received by the Mayor and citizens with the utmost pomp and splendour, and by them conducted to the Bishop of Paul's palace, the place appointed for their residence, from whence, on St. Peter's eve following, they were attended by the prime nobility, who conducted them to the King's Head, in Cheapside, where they beheld the pompous marshalling of the City watch, afterwards were sumptuously entertained by Sir Thomas Baldry, the Mayor.

ANNE BOLEYN'S CORONATION PAGEANT.

But all the most gorgeous of the pageants of this gay period was perhaps that in honour of the coronation of the beautiful and hapless Anne Boleyn, May 29, 1533.

Previous to the coronation of the Queen, Henry ordered the Lord Mayor to make great preparations for conducting her from Greenwich to the Tower by water; and also that the City might be decorated on her proceeding from thence to Westminster.

The Lord Mayor, in consequence with the Royal mandate, ordered all the City companies to attend him on the river, at Billingsgate, with their barges properly decorated and good bands of music. In consequence of this, fifty barges were prepared, and about one o'clock set off to attend the Lord Mayor's barge, which was richly ornamented, with streamers to keep at a proper distance from each other during the procession.

The City barge was covered with gold brocade and silken sails, with two rich standards of the Royal arms at the head and stern; and a great variety of streamers and flags, containing the arms of the companies, and a most beautiful and splendid appearance. Before the City barge was one mounted with ordnance, carrying figures of savages, dragons, and other creatures, vomiting out fire and smoke, and making an incessant noise. On the left of the City barge was another, representing a mount, which ascended by steps, and on the summit sat Fidelity, in a pavilion, with two virgins, richly adorned with red and white roses; and round the mount sat beautiful virgins, singing and playing melodiously on instruments of music. After these followed all the companies' barges in their proper order, and the whole form'd a most beautiful and splendid appearance.

The Queen was highly pleased with the magnificence of the procession; and, on her arrival at the Tower of London, she returned the Mayor and citizens her sincere thanks for their pompous attendance.

[illegible] Mayor being then appointed Lady's procession to [illegible] she was received at the Tower gate, by the Lord [illegible] and two noblemen [illegible] collar of SS, attended by [illegible] and Cornish with [illegible] and white damask. From the Tower to Fenchurch-street streets were new gravelled, and railed on each side; from which, in Gracechurch-street, stood the company of Hanseatic merchants, and next to them the several corporations of the City, in their respective formalities, reaching to the aldermen's station at the further end of Cheapside. On the outside were placed the City constables, dressed in silk and velvet, with staves in their hands, to keep off the crowd and prevent disturbances. Goldsmith's-row [illegible] with [illegible] and scarlet cloth.

Twelve of the French Ambassador's servants preceded the procession: they were dressed in blue velvet, mounted on horses trapped with blue sarsenets, interspersed with white crosses; after whom marched those of the equestrian order, two and two, followed by the judges in their robes; after them the Knights of the Bath, in their violet gowns, trimmed with meniver; then the Abbots, Barons, Bishops, Earls, and Marquises, in their robes, two and two; after these the Lord Chancellor, Venetian Ambassador, and Archbishop of York; next, the Ambassador of France and the Archbishop of Canterbury, followed by two gentlemen who represented the Dukes of Normandy and Aquitain; then proceeded the Lord Mayor of London, with his mace, and Garter in his coat of arms; then the Duke of Suffolk, Lord High Steward, and the Lord Howard as Deputy-Marshal of England; next followed all the other great officers of state in their robes, carrying the symbols of their several offices; these were followed by the nobility, in crimson velvet, and all the Queen's officers in scarlet, followed by her Chancellor uncovered, who immediately preceded his mistress sitting in a litter or chair covered with tissue of silver, and drawn by two beautiful pads, clothed in white damask, and led by her footmen. Her Majesty was dressed in a silver brocade, with a mantle of the same, furred with ermine. Her hair hung loose, and on her head was a chaplet, adorned with jewels of inestimable value. Over the litter was a canopy of cloth of gold, supported by sixteen knights alternately, four at a time, with a silver bell hanging at each corner. Her Majesty's Chamberlain followed next, and after him her Master of Horse leading a stately pad, with a side saddle, and trappings of silver tissue; next to these came seven ladies in crimson velvet, faced with gold brocade, and mounted on beautiful horses richly trapped with gold; these were followed by two chariots covered with cloth of gold, in which were the Duchess of Norfolk and Marchioness of Dorset in the first, and in the second four ladies in crimson velvet; next came several ladies in the same apparel on horseback, adorned with beautiful trappings, then a third chariot all in white, carrying six ladies in crimson velvet; then a fourth, all in red, in which were eight ladies in the same dress; then thirty gentlemen, attendants on the ladies of honour, on horseback, dressed in silks and velvets; and the whole was closed by the guards, well mounted, and elegantly accoutred.

On her Majesty's arrival in Fenchurch-street, she stopped at a beautiful pageant, crowded with children in mercurial habits; who, addressing themselves to her Majesty, congratulated her on her happy arrival. She then proceeded to Gracechurch-corner, where was erected a magnificent pageant, representing Parnassus, with the fountain of Helicon, in white marble, from which were four springs issuing out Rhenish wine, which centred in a small globe at the summit, and continued running plentifully all day; on the mount sat Apollo, and at his feet Calliope, under whom were the rest of the Muses playing on musical instruments; and at their feet were inscribed, in letters of gold, epigrams adapted for the occasion.

At Leadenhall was another stately pageant, representing a hillock encompassed with red and white roses; above which was a golden standard, and a little higher a tippe, with a celestial rose, from which descended a white falcon which perched on the stump; this was soon followed by an angel in a celestial choir, who put a crown of gold upon his head. On the hillock, a little lower, sat St. Anne, surrounded by her progeny, one of whom addressed the Queen in a speech, wishing her Majesty blessed with a happy issue.

At the conduit in Cornhill the Graces sat enthroned, with a fountain before them incessantly playing with wine, and underneath a poet describing their peculiar qualities, and presenting the Queen with their several presents. The great conduit, which opposite Bearers'-hall, in Cheapside, was beautifully painted with a variety of curious emblems, and which, for the entertainment of the populace, ran all day with a diversity of rich wines. The standard in Wood street was beautifully ornamented with the portcullises, encompassed by a number of flags, on which were painted coats of arms and trophies; and above was a fine concert of music, both vocal and instrumental. When her Majesty arrived at the Aldermun's station, near the little conduit, at the upper end of Lothbury, Sir John Baker, the recorder, after addressing her with an elegant speech, presented her, in the name of the citizens, with a purse of gold tissue, containing 1000 marks, which her Majesty gratefully received. On the little conduit, in a rich pageant, were seated Pallas and Mercury, before whom stood Mercury, who, in their names, presented the Queen with a golden ball thrice divided, representing the three gifts of wisdom, riches, and felicity. At the gate of St. Paul's a stately pageant presented itself, in which three ladies sumptuously dressed, with chaplets on their heads, delivered various instruments of music to the Queen, as her Majesty passed St. Paul's School, she was highly entertained with verses made by the scholars in praise of herself and the King.

The prison of Ludgate was beautifully ornamented, on the top of which were men and boys singing a concert during the procession. A handsome tower, with four turrets, was erected at the end of Shoe-lane, Fleet-street; in each turret stood a cardinal virtue, and their symbols who, addressing themselves to the Queen, promised never to forsake her while she lived; her constant attendants. The conduit ran the whole time with a variety of fine wines, and in the tower was a fine concert of music.

At Temple-bar her Majesty was again entertained with songs in concert between men and boys; and, proceeding from thence to Westminster, she there dismissed the Lord Mayor, returning him her sincere and hearty thanks for his good offices and those of the citizens on this occasion.

The following day being appointed for her Majesty's coronation, the Lord Mayor and aldermen appeared in civic robes, with collar of SS, attended by the aldermen and Sheriffs in scarlet, repaired to Westminster, where they performed their several offices belonging to that ceremony. And on the Wednesday following, the King sent for the Mayor and aldermen to Westminster, who attended accordingly, his Majesty returned them thanks for the good services both to him and the Queen.

On the 19th May the [illegible] Anne Boleyn was beheaded on Tower-hill, to the [illegible] [illegible] mour was wedded to the inhumane tyrant. She did not long survive the honour; and in July 1540, the King married Anne of Cleves.

On the [illegible] she was met on Blackheath, on the road to London, by [illegible] eminent merchants, and those of Genoa, Florence, Venice, and Spain resident in the city of London, together with a number of the principal gentry, commoners, and aldermen to the number of 160, richly dressed in velvet, with chains of gold, and mounted on stately horses, and accompanied by the King, divers foreign Princes, the nobility, and the Lord Mayor, was conducted in great magnificence to the royal palaces at Greenwich.

The marriage was solemnised on Twelfth-day; and on the 4th of February, being the day appointed for their Majesties' removal to Westminster, the Lord Mayor and aldermen, in the City barge, attended by the principal companies in their respective barges, most pompously equipped, repaired to Greenwich, whence they conducted the King and Queen by water to Westminster.

On the 21st of August, Claud Annebaut, Ambassador Extraordinary of France, arrived at London from Dieppe, and landed at the Tower Wharf, where he was met by the Mayor, aldermen, and citizens, and conducted to the Bishop's palace; and, on his departure, after having sworn, in the name of his Sovereign, to perform the articles of the peace, he was presented by the city with four large silver flagons, richly gilt, valued at £126, besides wine and other costly presents.

III FROM THE DEATH OF HENRY VIII. TILL THE ACCESSION OF THE HOUSE OF BRUNSWICK.

Edward VI., being nine years old, succeeded his father, 28th January 1547; his maternal uncle, the Duke of Somerset, being chosen Lord Protector. On the 6th of February the Lord Protector commenced his high office by knighting the young King, in the presence of the Lord Mayor and many other nobles and gentlemen; immediately after which the King, standing under a canopy of state, took the sword from the Lord Protector and knighted Henry Hobbethorn, then Lord Mayor, which was the last act of chivalry performed by him.

In 1550, poor Mary of Scotland, and Dowager Queen of France, after the death of the King her husband, on her return from France through England, was sumptuously entertained at the Bishop of London's Palace, by the Mayor and citizens, for four successive days, and at her departure was attended by the principal nobility with the utmost magnificence to Shoreditch Church, and thence by the Sheriffs to Waltham.

Let us drop the veil of oblivion over the melancholy pageantry which attended another hapless plaything of fortune, Lady Jane Grey, in her short-lived triumph and assumed sovereignty.

On August 3, 1553, Mary having got rid of the usurper, made her public entry into London, preceded by the Lord Mayor, in a crimson velvet gown, bearing a golden sceptre in his hand. A stage was erected without Aldgate, on which stood the poor children of Christ's Hospital (then but recently founded), one of whom made an oration:—

"The last of September," says Stowe. "Queene Mary rod [illegible] ter, sitting in a chariot of cloth of tissue, drawne with six horses, all trapped with the like cloth of tissue. She sate in a gowne of purple

velvet furred with powdered ermine, having on her head a caule of cloth of tinsell, beset with pearle and stone, and above the same upon her head a round circlet of gold, beset so richly with precious stones, that the value thereof was inestimable: the same caule and circlet being so massy and ponderous, that it was hard for her to bear her head with her hand, and the canopy was borne over her chariot. Before her rode a number of gentlemen and knights, then judges, then doctors, then bishops, then Lords, then the council; after whom followed the Knyghts of the Bath, thirteen in number, in their robes; the Bishop of Winchester, Lord Chancellor; and the Marquesse of Winchester, Lord High Treasurer: next came the Duke of Norfolke, and after him the Duke of Oxon, who bare the sword before hir: the Maior of London, in a gowne of crimosin velvet, bare the sceptre of gold, &c. After the Q. charist, Sir Edward Hastungs led her horse in his hand: then come another chariot, having a covering all of cloth of silver al white, and six horses trapped with the like: therein sate the Lady Elizabeth and the Lady Anne Cleve; their ladies and gentlewomen riding on horses trapped with red velvet; after them followed two other chariots covered with red satin, and their horses betrapt with the same, and certaine gentlewomen betweene every of the said chariots riding in crimosin satin, their horses betrapped with the same: the numbers of the gentlewomen so riding were forty-six, besides them in the chariots."

On the line of road there were several stately pageants, and the conduits ran with wine, and she was everywhere received with such respect by the citizens, that on her alighting at Whitehall she gave the Lord Mayor her thanks. On the following day she was crowned, the Lord Mayor, assisted by twelve of the citizens, officiating as chief butler. For which service he received a gold cup and cover weighing seventeen ounces.

On the 18th of August of the following year, the Queen having married Philip of Spain at Winchester, made her public entry with her husband into London, on which occasion the City was sumptuously adorned, and embellished with a great number of stately pageants; "nor was any expense spared by the citizens to testify their attachment to the royal pair."

Queen Mary's coronation procession was no less magnificent than anything of the kind which had previously occurred; but the long account given of these pageants has been so often republished, that we shall content ourselves with a briefer statement.

At the time of her sister's death, Elizabeth was at Hatfield, in Hertfordshire, from whence she repaired the next day to London, and was met at Highgate by the Lord Mayor, Aldermen, and Sheriffs, who conducted her Majesty to the Tower of London with great pomp.

On the 14th day of January, 1559, the Queen rode in grand procession through the city of London to Westminster, amidst the acclamations of an infinite number of people. At the west end of Cheapside, the Recorder addressed her Majesty in an affectionate speech, and at the same time presented her, in the name of the citizens, with a velvet purse, richly embroidered, containing 1000 marks of gold. Her Majesty thanked the citizens for this token of their affection, promised to continue their good and gracious Sovereign, and that she would not hesitate to spare her blood for their protection. But nothing endeared their new Sovereign more to them than her acceptance of an English Bible, richly gilt, which was let down from a pageant in Cheapside, by a child representing Truth. The Queen received the book with both her hands, and, having kissed it, laid it to her breast, and assured the City that she esteemed that gift more than all the sumptuous presents they had made her. The next day the Queen was crowned in Westminster Abbey.

On the defeat of the Spanish Armada, Queen Elizabeth went in great state to St. Paul's, to return thanks.

On the 23rd of January, 1570, Queen Elizabeth, attended by the nobility, went to the City, and dined with Sir Thomas Gresham, Kt., at his house in Bishopsgate-street. After dinner, her Majesty returned through Cornhill, went into the Burse newly built by Sir Thomas and, after viewing it in all parts, commanded proclamation to be made by a herald, with sound of trumpet, that thenceforth it should go by the appellation of "the Royal Exchange."

On the accession of James I., he was met (May 7, 1603) at Stamford-hall, by the Lord Mayor, aldermen in scarlet robes, and "500 grave citizens in velvet coats and chains of gold," and conducted to the Charterhouse, where he and all his train were treated with a most Royal entertainment, by Lord Thomas Howard, for four days.

BOISTEROUS ENTERTAINMENT TO CHRISTIAN IV. OF DENMARK.

In 1606, Christian IV., King of Denmark, came to England (July 7, remaining till the 11th), on a visit to the Queen, Anne of Denmark, his sister:

During his residence here he was treated with extraordinary magnificence and cordiality. His entry into London was graced by the citizens with as much display as possible: he had been customary at the coronation of their own sovereigns. He, on Christian's arrival through the City in grand procession, preceded by the Lord Mayor, bearing a golden sceptre, and followed by a most splendid train of British and Danish nobility. "Upon the Great Fountain, in Cheapside," Stow says, "was erected a stage, and there the Recorder of the City, clothed in the Goldsmith's-row, where sat the great elders of the City, in scarlet robes, the Recorder made a solemn oration in Latin, and presented the King of Denmark with a curious cup of massy gold." Several of the conduits ran with wine, and at that in Fleet-street there was a plentiful supply with sugars, "wherewith the Kings were much delighted." On the following day the Royal Dane visited the principal public buildings, and a few days afterwards he was splendidly banqueted. Of this carousal, and of the general hilarity and riot occasioned by Christian's visit, Sir John Harington, Queen Elizabeth's god-son, has given the following particulars, in a letter from London to Mr. Secretary Barlow, inserted in the first volume of the "Nugæ Antiquæ:"

"I came here a day or two before the Danish King or no, and from the day he did come until this hour, I have been well nigh overwhelmed with carousal and sports of all kinds. The sports began each day in such a manner and such sorte as well might persuaded me of Mahomet's paradise. We had women, and musick, and wine too, of which plenty would have astonished each sober beholder. Our toasts were magnificent, and the two Royal guests did most lovingly embrace each other at table. I think the Dane hath strangely wrought on our good English nobles: for those whom I never could get to taste good liquor, do follow the fashion and wallow in beastly delights. The ladies shun it their sobriety, and are seen to roll about in intoxication. In good sooth the Parliament did kindly to provide his Majestie's revenues ably with money, for there hath been no lack of good living—shows, sights, and banquetings from morn to eve.

"One day a great feast was held, and after dinner the representation of Solomon in his Temple and the Coming of the Queen of Sheba was made; or, as I may better say, was meant to be made, before their Majesties, by device of the Earl of Salisbury and others. But alas! all their earthly labours do fail to poor mortals in enjoyment, so did prove our presentment herof. The lady who did play the Queen's part did carry most precious gifts to both their Majesties; but, forgetting the steppes arising to the canopy, overset her caskets into his Danish majesty's lap, and fell at his feet: though I rather think it was in his face. Much was the hurry and confusion; but cloths and napkins were at hand to make all clean. Her then got up and would dance with the Queen of Sheba, but it fell down and humbled himself before her, and was carried to an inner chamber, and laid on a bed of state, which was not a little defiled with the presents of the Queen which had been bestowed on his garments, such as wine, cream, jelly, beverage, cakes, spices, and other good matters. The entertainment and show went forward, and most of the presenters went backward, or fell down, wine did so occupie their upper chambers. Now did appear, in rich dress, Hope, Faith, and Charity. Hope did essay to speak, but wine rendered her endeavours so feeble that she withdrew, and hoped the King would excuse her brevity. Faith was then all alone, for I am certain she was not joyned with good works, and left the Court in a staggering condition. Charity came to the King's feet, and seemed to cover the multitude of sins her sister had committed: in some sorte she made obeysance and brought gifts, but said she would return home again, as there was no gift which Heaven had not already given his Majestie! She then returned to Hope and Faith. Next came Victory, in bright armour, who presented a rich sword to the King, who did not accept it, but put it by with his hand; and by a strange piece of versification, did endeavour to make suit to the King. But Victory did not triumph long; for, after much lamentable utterance, she was led away like a silly captive, and laid to sleep in the outer steps of the ante-chamber. Now did Peace make entry, and strive to get forenoste to the King; but I grieve to tell how great wrath she did discover unto those of her attendants, and, much contrary to her semblance, most rudely made war with her olive-branch, and laid on the pates of those who did oppose her coming. I have much marvelled at these strange pageantries, and they do bring to my remembrance what passed of this sort in our Queen's days, of which I was sometime in small measure presenter and assistant. But I ne'er did see such lack of good order, discretion, and sobriety as I have now done."

In June, 1607, James dined with the Lord Mayor, at Clothworker's Hall, on which occasion a grand supper is described "as proceeding at an hour's notice, and as being served with a profusion of delicacies." The Royal family, with the Princess Elizabeth, created Princess of Wales, dined at the Merchant Tailors' Hall on Oct. 29th, being Lord Mayor's Day. Frederick the Elector Palatine, who had come over to solemnize his nuptials with the Princess Elizabeth, dined with the Lord Mayor, at the Guildhall, where they were entertained in a sumptuous manner. After the feast, the Lord Mayor, in the name of the citizens, presented his Highness with a very large basin and ewer, and two large pots or flagons of silver, richly gilt; and, upon the wedding day, the Lord Mayor presented the electoral bride with a necklace of oriental pearl of above £2000 in value.

The next Royal guest of the citizens of London was the unhappy Charles I., and that at a moment when he was in the thick of all his troubles.

On the 25th of November their Majesties returned from Scotland, whither the King had gone to attend the Scottish Parliament, and were met between Kingsland-road and Stamford-hill by the Lord Mayor, aldermen, and two citizens on horseback, drawn from the different companies, and conducted in grand procession to Guildhall, where they were splendidly entertained. In the evening they were conducted to the palace at Whitehall; the conduits running with wine, and the populace making loud demonstrations of joy. Sir Richard Gurney, the Lord Mayor, by whose influence this entertainment was principally given, was soon afterwards created a Baronet. Notwithstanding the apparent cordiality, the King within a few days judged it necessary to return with his family to Hampton Court, his palace having been several times surrounded by an insulting rabble: on the petition of the City however, procured by the address of Gurney, which assured him that "the better sort of people" were not at all concerned, he shortly returned to Whitehall.

After the execution of Charles I., the Lord Mayor, Sir Abraham Reynardson, having refused to obey the order of the Commons in pr[illegible] ing the abolition of the kingly office in England and Ireland, was imprisoned for two months, degraded from his mayoralty, and fined £2000; and, on the 3rd of April, Alderman Pennington was chosen Mayor in his stead. A splendid entertainment at Grocers' Hall, at which the members of the House of Commons and the principal officers in the army attended, commemorated the event.

In December, 1653, Cromwell was sworn into the office of Lord Protector; and, in the following February, he dined with the Corporation of the City, at Grocers' Hall, when the entertainment was conducted with Royal splendour. On this occasion Cromwell exercised one of the highest acts of a Sovereign, by conferring the honour of knighthood on the Lord Mayor.

The hearty co-operation rendered to Monk in bringing about the restoration of Charles II. is matter of too general history to require more than a passing reference here; and the rejoicings with which the attempt received there as few King are also well known.

On the 26th of May, 1660, the King landed at Dover; and on the 29th he made his public entry into the metropolis. "all the ways thither," says Clarendon, "being so full of people and acclamations, as if the whole kingdom had been gathered there." In St. George's Fields he partook of a rich collation, provided by the Lord Mayor and aldermen, under a magnificent tent; after which he proceeded through the City to Whitehall, the houses being hung with rich silks and tapestry, the conduits flowing with wine, and the streets and buildings crowded with spectators, all of whom "expressed their joy with such protestations as can hardly be imagined." The procession itself was conducted with extreme pomp: the King riding between his brothers, the Dukes of York and Gloucester, preceded by the Lord Mayor, Sheriffs, aldermen, and six hundred of the principal citizens, in gorgeous apparel, with gold chains, as well as by many hundred gentlemen, "all gloriously habited and gorgeously mounted." On the same night Whitehall was illustrated with the Order of the Garter at Windsor, as an earnest of the [illegible] doctorous entertainment.

On the 8th of July, the King, with the Princes his brothers, all the principal nobility, the great officers of State, and both Houses of Parliament, was sumptuously banqueted by the City, at Guildhall, the viands being interrupted with "the most exquisite musicke."

Charles II. was so pleased with the Civic entertainments, that he seven times in the course of his reign dined with the corporation or its companies.

The Prince of Orange landed at Torbay on the 5th Nov., 1688, and James II. left London with the avowed intention of marching against him, but indeed to make his own escape. As soon as his flight was known, the Lords spiritual and temporal met at Guildhall, and signed and published their declaration to apply to the Prince of Orange to assume the government of the country. This was followed the same day by an address from the Lord Mayor, aldermen, and Common Council, and by another from the Lieutenancy, of the City of London, to the Prince of Orange, in which they expressed similar sentiments.

On the evening of the 17th, that Prince finally departed from Whitehall, the Prince of Orange arrived at the Palace of St James, where he received the congratulations of the nobility, and of the Lord Mayor, aldermen, and Common Council of London. The coronation took place on the 11th of April following.

Sir Thomas Pilkington, the Lord Mayor, being re-elected for the year ensuing, in the name of the City, invited the King, Queen, Prince and Princess of Denmark, and both Houses of Parliament, to dine at Guildhall, on the approaching Lord Mayor's Day; at which time their Majesties, accompanied by their Royal Highnesses, and attended by a numerous train of the nobility, repaired to Cheapside, where they beheld the gorgeous cavalcade pass; which, considering the beautiful decorations of the streets, the richness of apparel, the fine appearance of the militia and Artillery Company, the pomp of the Royal regiment of Horse Volunteers, consisting of the chief citizens most sumptuously accoutred, and led by the Earl of Monmouth, and the magnificence and curious embellishments of the several pageants, seems to have equalled, if not excelled, everything of the kind before seen in this city for splendour and magnificence. The show being over, their Majesties were, by the Sheriffs, conducted to Guildhall, where they were entertained with a truly Royal feast; and the joyful day concluded with bonfires, ringing of bells, and general illuminations in all parts of the City. And through the whole course of this solemnity, nothing was omitted to demonstrate the dutiful respect and hearty affection of the citizens to their Majesties. Yet a few days after, some malcontents and fanatics published the King's picture of the crown and sceptre, for the apprehending of whom the Court of Lord Mayor and Aldermen offered a reward of five hundred pounds.

The rejoicings on occasion of the treaty of Ryswick are thus described in the *Monthly Mercury* of that period:—

The King being returned from Holland after the conclusion of the treaty of Ryswick, he was humbly entreated by the Lord Mayor and citizens of London, on that happy and joyful occasion, to make his public entry into this city, which his Majesty graciously condescended to, and appointed the 16th of November, to set out from Greenwich in his coach of state, accompanied by his Royal Highness George, Prince of Denmark, and attended by the great officers of state, together with a select train of the nobility and gentry. On his Majesty's approach to the City, he was received at St. Margaret's-hill, in Southwark, by the Lord Mayor, aldermen, Recorder, and Sheriffs, in their formalities, on horseback; where the Lord Mayor, alighting, presented the City sword to his Majesty, who returned it, with a gracious command to bear it before him. Whereupon the Recorder diamounted, and, in a short, but eloquent speech, congratulated his Majesty on the conclusion of the late peace, and on his safe and happy return to his dutiful and loyal people.

From thence a hundred of the City trained bands led the way, followed by two of the King's regiments, called the Blues, and the City Marshals with their men; the Sheriffs and City officers, according to their several degrees, the latter on horseback; after whom rode the Aldermen, Sheriffs, and such as had fined for either of those dignities.

Then came the King's trumpets and kettle-drums, the heralds of arms, according to their distinctions, between the serjeants at arms, bearing their maces, all bare-headed. Then the Lord Mayor, in a crimson velvet gown, with his collar and Prince George's sword of state, the Clarencieux King at Arms on his right hand and one of the gentlemen ushers on the left.

Then the King, in a rich coach of state, accompanied by Prince George, with one gentleman of the bedchamber in waiting, and attended on each side by his Majesty's equerries, footmen, and others of the guard, led by their respective officers, and followed by his Majesty's Life Guards, and a long train of coaches, with each six horses, of the great officers of state, nobility, and others. The streets were all the way lined and guarded by the trained bands.

Arriving at Whitehall, the Lord Mayor attended his Majesty to the foot of the stairs leading to the Royal apartments, where, having taken leave of his Majesty, his Lordship and the Aldermen were conducted to the Lord Steward's lodging, where they were entertained with an elegant supper.

The balconies and windows were crowded with infinite numbers of spectators, so that it was in a manner a double show, and the cavalcade was a pleasing sight to the beholders, and they no less delightful object to the cavalcade.

On this joyful occasion the City was embellished with the most pompous decorations; and before St. Paul's School were placed the bluecoat boys, one of whom congratulated his Majesty in a very handsome speech.

Queen Anne, who succeeded to the throne, March, 1702, on the 9th of November following dined with the Lord Mayor and corporation at Guildhall. On the 12th she went in great state to St. Paul's, accompanied by both Houses of Parliament, to attend a solemn thanksgiving for the success of the Earl of Marlborough in the Low Countries, and of Sir George Rook at Vigo.

IV.—FROM THE ACCESSION OF GEORGE I. TO THE YEAR 1802.

On the death of Queen Anne (Aug. 1, 1714), the House of Brunswick succeeded to the throne of these realms; and, a few days after, George I. made his public entry into London, accompanied by his son, Prince George, amidst much rejoicing. The new King accepted the usual invitation to dine at the Guildhall on the approaching Lord Mayor's Day; and such time his Majesty and their Royal Highnesses the Prince and Princess of Wales, attended by a numerous train of nobility, went to the usual place of standing, opposite Bow Church, in Cheapside; and after having beheld the pompous cavalcade, were conducted by the Sheriffs to Guildhall, where they were sumptuously entertained by the citizens, who exerted the utmost of their abilities to convince them of their loyalty and affection for his Majesty's person and Government. And the Lord Mayor having the honour to present the first glass of wine to the King, his Majesty was pleased to order a patent to be passed for creating his Lordship a Baronet of this kingdom, and at the same time ordered one thousand pounds to be paid to the Sheriffs, for the relief and discharge of poor people imprisoned for debt.

After the accession of George II., June, 1727, on the 6th of October following, at a common council, it was unanimously resolved to invite their Majesties, his Royal Highness the Duke, and the three eldest Princesses, to the dinner at Guildhall, on the approaching Lord Mayor's Day; and pursuant to which, the Lord Mayor elect, Sheriffs, and Recorder, were ordered to attend their Majesties, to know their Royal pleasure: at the same time, a committee of four aldermen and eight commoners were appointed to attend his Majesty, to desire leave to put up his Majesty's and his Royal consort's pictures in Guildhall; upon both which accounts his Majesty being attended, he was graciously pleased to accept of the former, and comply with the latter; upon which being reported the next day in common council, a committee of eight aldermen and sixteen commoners were appointed to superintend the entertainment to be provided for their Majesties. And the Sheriffs having invited the Duke and the Princesses, their Majesties, accompanied by the latter, and attended by the great officers of state, with a numerous train of the nobility, and all the Foreign Ministers, came into the City, and in a balcony in Cheapside, the usual place of standing, beheld the pompous procession pass; whereupon their Majesties were conducted to Guildhall, at the entrance whereof the Lord Mayor, kneeling, presented the City sword to the King, who graciously returning the same, it was by his Lordship carried before their Majesties to the council chamber, where the Recorder complimented his Majesty in an address in the name of the citizens.

From the Council Chamber, their Majesties (preceded by the Lord Mayor carrying the City sword) and the Princesses went to the hustings, where they were most sumptuously entertained, the ladies of the bedchamber having the honour to dine at the Royal table, while other tables were provided below in the hall for the nobility, foreign ministers, judges, ladies, and other persons of distinction, together with tables for the Lord Mayor, aldermen, and common councilmen. The illustrious company having seated themselves, and silence commanded, the common cryer proclaimed, that his Majesty drank to the health of the Lord Mayor, and prosperity to the City of London and the trade thereof, and that her Majesty confirmed the same. Silence being again commanded, proclamation was made, that the Lord Mayor, aldermen, and common councilmen drank health, long life, and happiness to our gracious Sovereign Lord King George. And silence being again commanded, the Lord Mayor, aldermen, and common councilmen drank health, long life, and happiness to our most gracious Queen Caroline and all the Royal family.

After dinner, their Majesties, accompanied by the Princesses, were graciously pleased to return to the Council Chamber and thence to the Long Gallery, where they honoured the ball with their presence till 11 o'clock. On this occasion his Majesty was graciously pleased to order the sum of one thousand pounds to be paid to the Sheriffs, for the relief and discharge of poor insolvent prisoners.

The concert of music at this sumptuous banquet, we are informed, consisted of two trumpets, one kettle drum, four French horns, eighteen violins, two violoncellos, two double basses, five hautes, seven bassoons, and six hautboys; together, forty-seven no doubt considered a perfect "*concert ancient*" in those days.

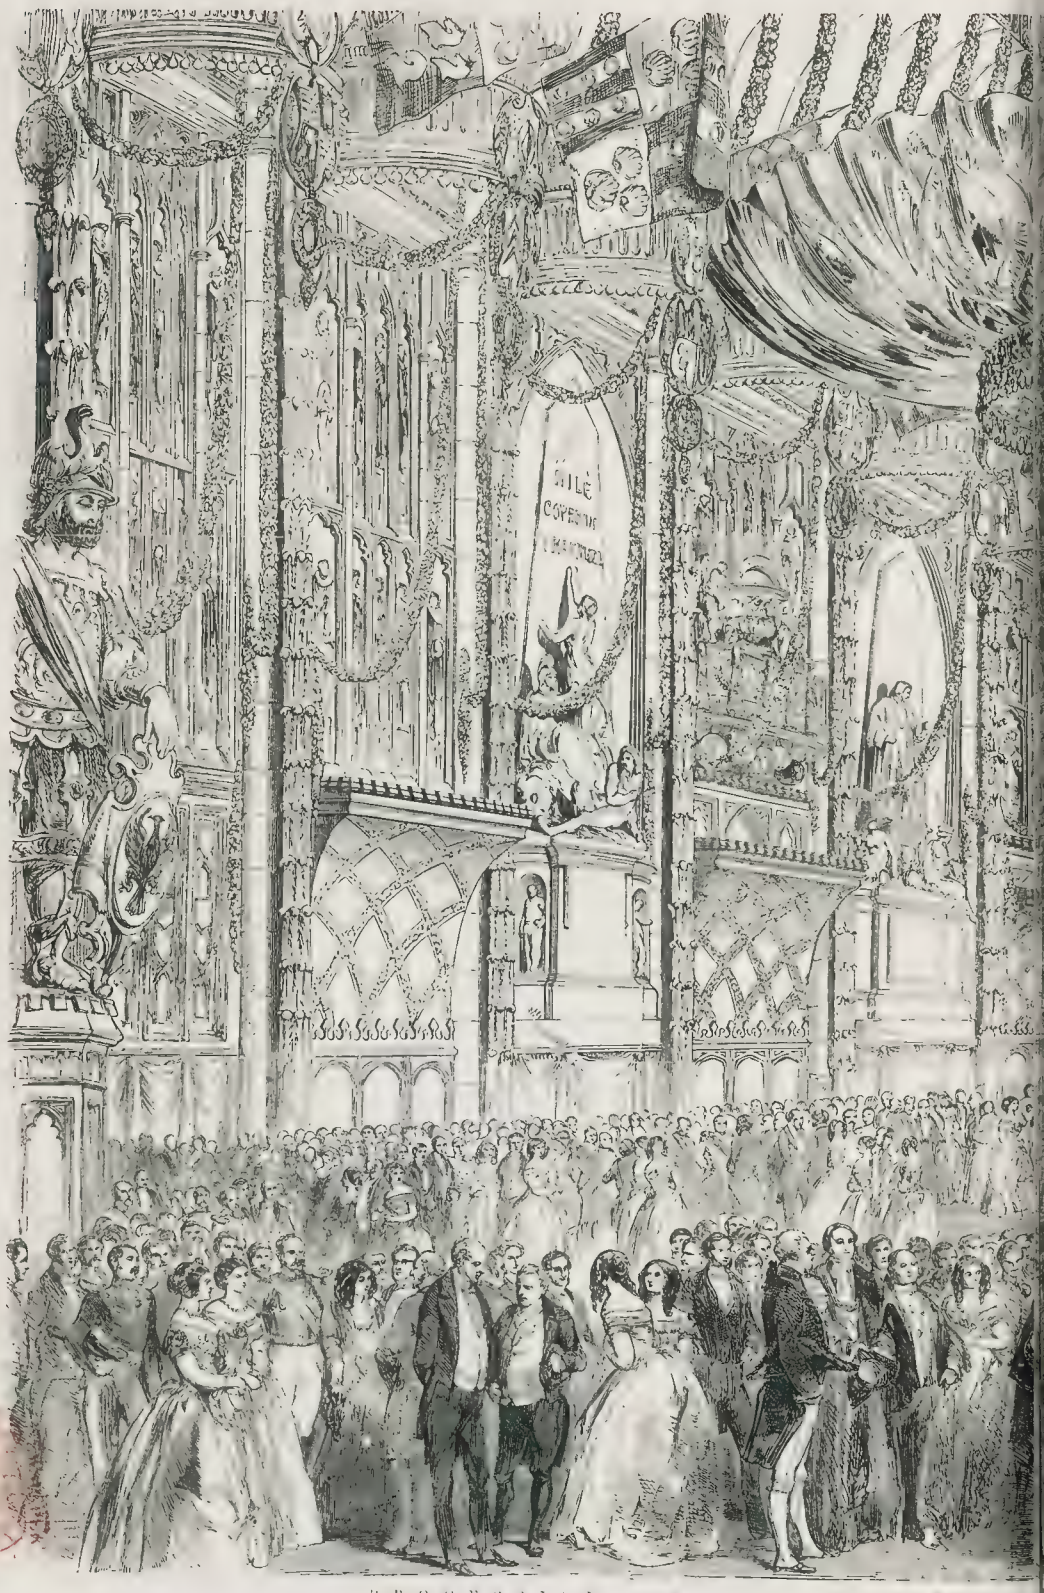
From the accounts relating to this entertainment, as recorded in the chambers of the City, the following further particulars are obtained. There were drunk at this 1676 dishes, of which 279 were for the Royal table. The wine provided, and, we have no doubt, consumed, amounted to 315 dozen and nine bottles, of which 167 dozen were claret, and 42 dozen red port, 21 dozen white port, and only 20 dozen champagne. The sum total of disbursements on account of this Royal entertainment was £4880 4s., which included an item which certainly reads a little strange, and it is the first on the list, viz. "To the King's cook for his assistance, £10 10s."

After the coronation of George III. and his newly-married Queen (1761), it was Sir Samuel Fludyer who had the honour of displaying the civic hospitalities to their Majesties. The ceremonial was conducted with the greatest magnificence, all ranks striving with each other to manifest their loyalty and attachment. "The pageants and decorations were more pompous than on any former occasion," and the entertainment was sumptuous beyond precedent, costing no less than £6898 8s 6d. On this occasion his Majesty and all the Royal family expressed their entire approbation of it: and the nobility and foreign ministers acknowledged it to have been far beyond anything of the kind they had ever seen.

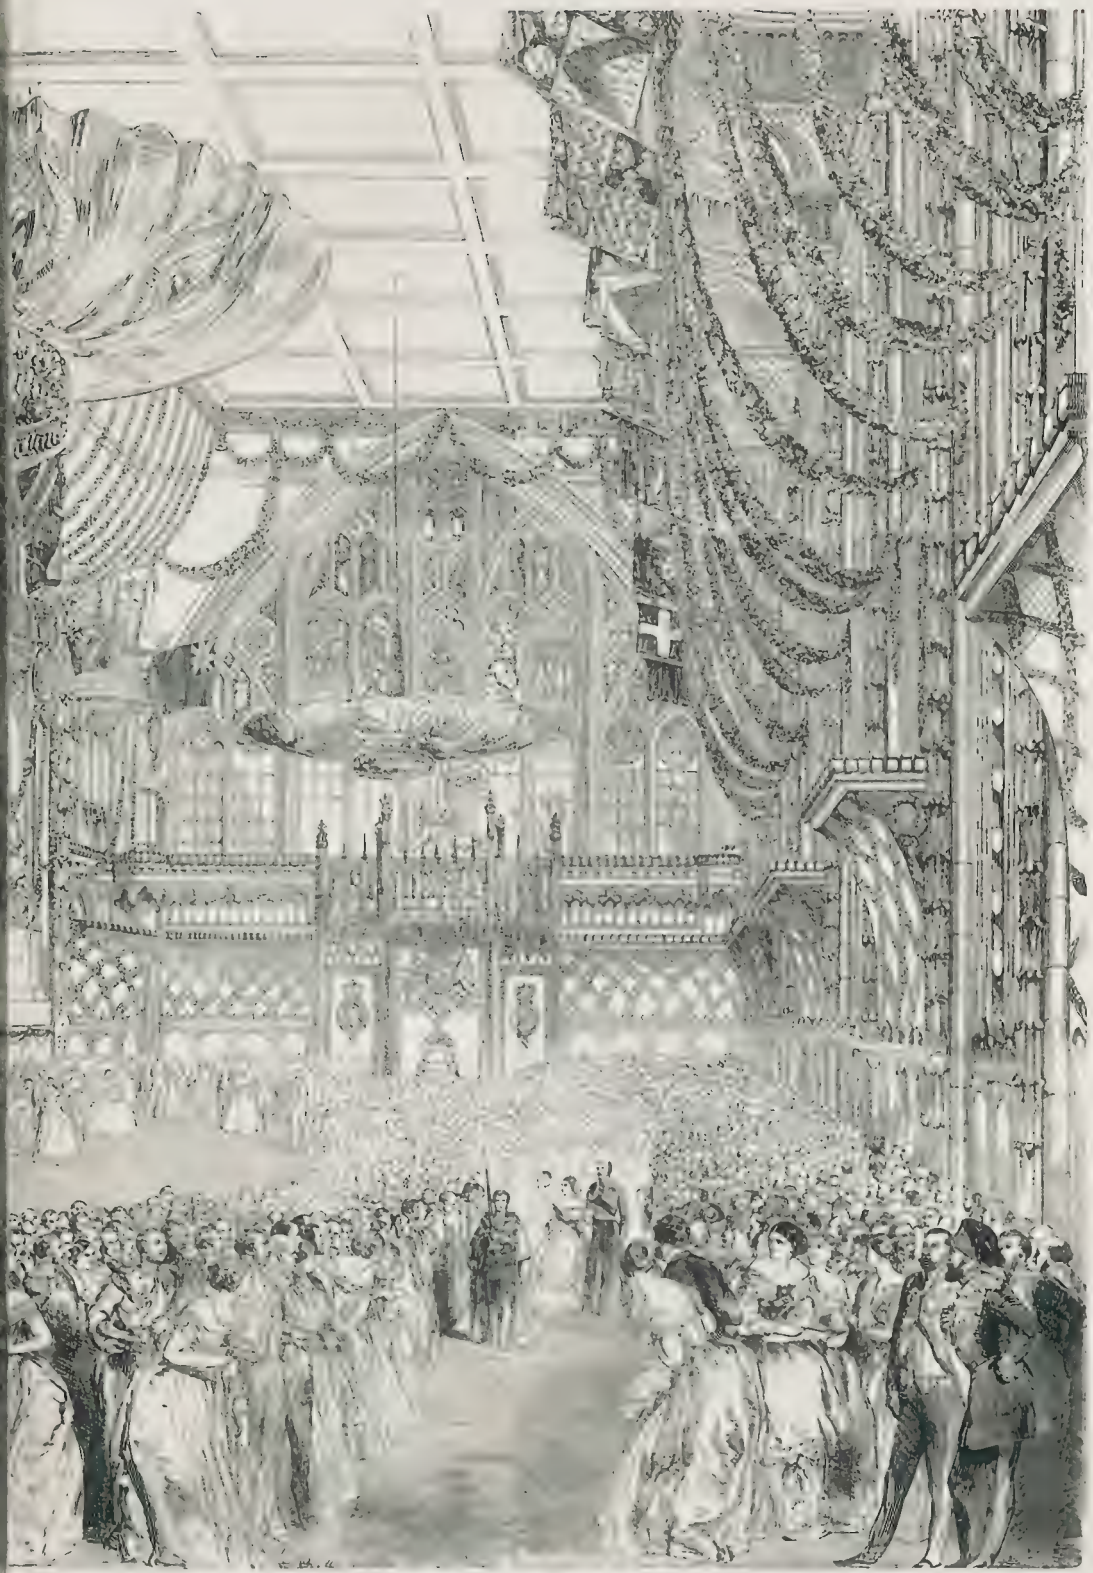
On the 2nd of April, 1789 (St. George's Day), the metropolis displayed a most splendid scene of festivity and show, in consequence of his Majesty's recovery from the calculous state of urinary which had befallen him in the preceding October. Their Majesties on that day went in great state to St. Paul's Cathedral, accompanied by both Houses of Parliament, the great officers of state, and the corporation of London, to make solemn thanksgiving on the happy occasion. Their Majesties set out from the Queen's palace soon after ten, in the order previously arranged by his Majesty himself. Between eleven and twelve the King's carriage arrived at Temple Bar, where the Lord Mayor was in waiting, attended by six delegates from the corporation: viz. Sheriffs Curtis and Shakespeare, Richard Bennett as alderman, and Deputies Lockey and Birch, with Messrs Wadd and Dixon, as commoners. The Lord Mayor and his associates came thither in coaches soon after nine, and were politely accommodated, by the banking-house of Messrs Child, in the great room immediately over the Bar, till, on notice of the king's approach, they all mounted their beautiful white palfreys, which were richly caparisoned, the saddles and bridles new for the occasion, silver stitched, silver roses, and silk reins; the furniture blue and gold, with tassels of gold fringe; the front of the bridles richly embroidered with the words "God save the King!" white fur caps to the holsters, richly wrought with gold, and each horse decorated with three dozen of favours, blue and white. The Lord Mayor was in a rich gown of crimson velvet; the two aldermen in their scarlet gowns, and the four commoners in their mazarine gowns, dressed uniformly in dark blue coats, white waistcoats and breeches, with purple roses in their shoes and at their knees. Each of them had a walking page, carrying a hat, adorned with a beautiful cockade of purple and gold, inscribed "Long live the King!" After they had taken horse, the Lord Mayor dismounting in form, surrendered the City sword to his Majesty, who having graciously returned it, the Lord Mayor, on horseback, carried it bare-headed before the King to St. Paul's. The Sheriffs and four commoners rode also bare-headed.

Nothing could exceed the magnificence of the procession from Temple Bar.

The streets through which the procession passed, on its going and returning, were filled with rejoicing spectators. Before most of the houses were placed temporary galleries, crowded with beauty and fashion. Every precaution which prudence could suggest was taken to guard against the accidents which might have been expected from such a numerous assemblage of people, but they were unnecessary; good humour had so completely taken possession of every individual, that the military, who were stationed to keep the multitude in order, had nothing to do but to see the procession with their fellow-citizens in the rear. On the following evening, a general illumination took place throughout London and Westminster, which, for splendour and magnificence, sur-



PROCESSION OF HER MAJESTY



STATE BALL IN THE BANQUETING

passed all former exhibitions. All the public offices, the houses of the nobility and gentry, as well as many of those of private individuals, were decorated with transparencies or elegant designs in coloured lamps; while, even in the humble garret of the indigent, the gleam of loyalty and affection twinkled as cheerfully, if not as brightly, as in the splendid mansion of the opulent.

On the 10th of December, 1798, the day appointed for a national thanksgiving for the three great victories obtained by Lord Howe over the French, in June, 1794; by Sir John Jervis over the Spaniards, in February, 1797; and by Admiral Duncan over the Dutch, in October, 1797; their Majesties, with most of the Royal family, officers of state, principal nobility, &c., attended divine service at St. Paul's Cathedral.

The Easter dinner at the Mansion House in 1802 was remarkable for the absence of the Sheriffs, in consequence of a second omission of attention from the Lord Mayor to their official situations. The Prince of Wales having honoured the dinner with his presence, they thought it their duty to apologise to his Royal Highness by letter, in which, after stating the Lord Mayor's neglect of that respect towards them which custom had established, and which, from their high office, they had a right to demand, they conclude, "Under this impression, your Royal Highness will not be surprised, that we resented what we considered indignity to our stations; that we refused to be mere puppets in what is presumed to be his private pageant; that we consented to sacrifice the unbounded pleasure we ought to have enjoyed, in humbly receiving, and dutifully waiting upon, your Royal person, to the feelings of public propriety."

On the signing of the short-lived treaty of Amiens, the re-establishment of peace with France was proclaimed with great solemnity in the cities of London and Westminster, on the 29th of April; the usual formalities of knocking for admission at the Herald's at Temple Bar being observed. In the evening both the City and West-End were brilliantly illuminated; the house of M. Otto, the French Minister, in Portman-square, being a device of dazzling splendour, including the words "Amity," "Peace," and the letters "G. R." surmounted by a crown, and "F. R." surmounted by a civic crown.

NOTES ABOUT THE GUILDHALL.

There are but few structures within the city of London of equal antiquity with the Guildhall, and probably none possessing such diversified historical associations. Although erected chiefly for the various purposes incident to the municipal system of government which London has always enjoyed, it has, in the progress of ages, been the scene of events of far wider interest and more general importance.

London, from the very earliest period, having been a self-governing community, has probably never been without a Guildhall as the seat and centre of local authority and administration. There seems little room for doubt that it had such a building in the remote times of Edward the Confessor. The original Guildhall stood westward of the present one, and abutted on Aldermanbury; and, in comparison with the now existing hall, is described by one of the old chroniclers as "a little cottage;" and by another, as "an evil-favoured olde house or cottage." The present spacious hall was begun to be erected in the year 1411, but was not entirely finished for many years afterwards, most likely from want

means to defray the great expense of completing so large an edifice. The celebrated Richard Whittington, through his executors, was a considerable benefactor to the work; and other eminent citizens also contributed liberally towards it.

The Guildhall of London has been the scene of many striking events connected with the history of the country, independently of those of municipal or local interest only. One in particular—the crafty attempt of Richard III. (through the Duke of Buckingham) to legalise the assassinated citizens into an approval of the usurpation of the regal dignity—has been so immortalised by Shakspeare that we give some particulars of it, from Knight's "London Pictorially Illustrated:"—

It was on Tuesday, the 24th of June, 1483, that the citizens were seen flocking from all parts towards the Guildhall, on some business of more than ordinary import. Edward IV. had died a few weeks before, and his son and successor was in the Tower, an heritage of which the Protector, anxious for the period of his coronation. Doubt and anxiety were in every face. The suspicions eagerness shown to set the youthful Duke of York from the hands of his mother in the Sanctuary at Westminster, and subsequently to place the Duke of Gloucester, in direct terms of the illegitimacy of his brother, and of the right indefeasible of their uncle, all produced a growing sense of alarm as to the future intentions of the principal actor, Gloucester. As they now entered the hall, and pressed closer to the platform at the upper end, they saw the Duke of Buckingham, arrayed form to address them, surrounded by many Lords, knights, and citizens, it was to be observed, in rich robes, standing in the centre of the hall. The deep [illegible] marked. "The deep [illegible] hose: that day, in the exhibition of his characteristic subtlety and address. Commencing with a theme which found a deep response in the malignant bosoms of his listeners, the late [illegible] and calamities of the late King, (which Londoners had especial reason to remember), he gradually led them to the consideration of another feature of Edward's character, his amours, which had, no doubt, caused many a heart-burning in the City domestic circles, and thereby an easy transition to his [illegible] alleging that the late King was not the son of the Duke [illegible] Richard was. To give confidence to his auditors, he added that the Lords and Commons had sworn never to submit to the bastard yoke; and thus accordingly to acknowledge the Protector as king. [illegible] The confident orator and bold politic as well as [illegible] marvellously abashed, and [illegible]

We have just seen that the decline of the population has been greatest in Connaught; now the commissioners tell us that in 1847 the maximum rate of mortality in the workhouses of that province was 436 per week in a thousand persons, so that in about 23 weeks at this rate the whole 1000 would be dead. The maximum rate of mortality in all the workhouses in that year was 25 per 1000 weekly, or the whole 1000 would die in something more than 39 weeks. That was surely a very frightful mortality. It took place amongst that part of the population for which room was found in the workhouses; and amongst the population out of the workhouses perishing by the wayside, the mortality must have been still more frightful. We are happy to believe, on the assurance of the commissioners, that matters are now improved, that workhouse accommodation is to be had—with one exception, Kilrush—for all who need it; that the expense of keeping the poor is diminished; that contagious diseases are less frequent, and that the rate of mortality has much declined. But the statement that such improvements have taken place, implies the greatness of the past sufferings. There can be no doubt, therefore, that the decay of the population has partly arisen from increased mortality on one hand, and from increased emigration and decreasing births on the other. Now that the Irish have a poor-law fairly administered, we may expect that, in future, such terrible scenes as were witnessed in 1847-48 will not again occur. But the state which authorised the landlords, by a law, to clear their estates of the peasantry, as they were vermin, destroying, as we have seen, 268 153 dwellings, without having previously imposed on those land lords the obligation of providing for the people, did a great wrong, and the decay of the people now testifies against it.

With reference to emigration—the least objectionable mode of getting rid of a population—there are no correct returns kept of the number of Irish who emigrate, because a great part of them go from Liverpool, and are set down in the returns as emigrants from England. It is supposed by those best acquainted with the subject, that more than nine-tenths of the emigrants from Liverpool are Irish. Taking that proportion, therefore, and adding it to the emigrants who proceed direct from Ireland, the number of Irish emigrants from 1842 to the present year was—

1843	.. ..	39,540	1847	.. ..	214 970
1844	.. ..	65,910	1848	.. ..	177 720
1845	.. ..	76,323	1849	.. ..	208,759
1846	.. ..	106,767	1850	.. ..	207,853
Total, 4 years, 278,749			Total, 4 years, 809,302		
Total, 8 years 1,088,051					

If we add 70,000 for the two first years of the decennial period not included in the return, we shall have 1,158,051 as the total emigration of the ten years. It was probably more than that, it could not well have been less. To this we must add the number of Irish who came to England and Scotland, of whom no account is kept. If we put them down at 30,000 a year, we shall have for the ten years 300,000, or the total expatriation of the Irish in the ten years may be assumed at 1,458 000, or say 1,500,000. At first sight this appears a somewhat soothing explanation of the decline of the Irish population; but, on being closely examined, it diminishes the evil very little in one sense, and threatens to enhance it in another.

So far as national strength is concerned, it is of no consequence whether the population die out or emigrate to another state, except that, if the other state be a rival or an enemy, it may be worse for the parent state that the population emigrate than be annihilated. In truth, the Irish population in the United States, driven away formerly by persecution, have embittered the feelings of the public there against England. Emigration is only very beneficial, therefore, when it makes room for one at home for every one removed. Such is the case with emigration to England to her colonies or to the United States, with which she has intimate trade relations; but such is not the case with the emigration from Ireland, for there we find a frightful void. No one fills the emigrant's place. He dies from the country because he cannot live in it; and the population, positively energet c, we may infer that few others can. In the ordinary course, had the 1,500 ,000 expatriated people remained, nearly one-third of the Irish would have died in the ten years; they would have increased the terrible mortality, and, without much adding to the present number of the people, would have added to the long black catalogue of death.

For the emigrants themselves removal is a great evil, a mere flying from destruction. The Poor-Law Comm sioners state that the number of pauper emigrants sent from Ireland in 1850 was about 20,000, or less than one per cent of the whole emigration; the bulk of the emigrants were not paupers, but persons of some means as well as of some energy. They were amongst the best of the population, and they carried off capital to them leaving the incapable, the worn out, and the feeble behind them; the natural and the vigorous, the seed of future generations went out of the land, and took with them the means of future increase. We doubt, therefore, whether such an emigration as that from Ireland within the last four years will not be found as fatal to its future prosperity as the famine which swept off the mortality at home. All the circumstances now enumerated tend to establish the conclusion, that, for the State, and for the people who remain behind, it is of very little consequence whether a loss of population, such as that in Ireland, be caused by an excessive mortality or excessive emigration.

To the emigrants themselves, after they have braved the pain of the separation and the difficulties of the voyage, and after they are established in better homes, the difference is very great; but it may happen that, to Ireland as a state, their success abroad will be rather dangerous than beneficial. On the whole, emigration does not account for the decrease of people; and if it did account for it, would not afford us the least consolation.

Of course the whole evil is the consequence of over population in one sense; but that sense, we must recollect, is not in relation to the soil. The phrase "over population" means in relation to the knowledge, skill, occupations, and moral habits of the people, and not to the extent of country in which they live. When a people unite manufactures to agriculture, and commerce to manufactures—when they are fishermen, workers in iron, cloth, and paper, as well as cultivators of the soil—they can be much more densely crowded, like the people of Holland or England, than those of Hungary, without any inconvenience or any impediment to their future growth. In fact, when we examine the matter we find that England was more densely peopled than Ireland years ago, and yet that the population has increased in the former, and has still room in it, while in the latter the people are rotting away. The facts may be briefly expressed in a tabular form:—

Number of acres in	Proportion of acres to persons in		
	1841.	1851.	
England	32,243,200	2·4	2·6 1·6
Ireland	19,344,200	2·9	3·4 0·6

In 1831, in relation to the soil, England was very nearly as densely peopled as Ireland. In 1841 it was more densely peopled, and the population has still gone on increasing, while the population of Ireland has gone backward; and England, with plenty of room for her people still to grow, is now much more densely peopled than Ireland. The power of obtaining the means of subsistence, and of living comfortably in a crowded country, depends, therefore, on the occupations and knowledge and skill of the people, not on the nature and extent of the soil; and were Irish merchants and manufacturers as numerous as the English, and had they similar and good knowledge and skill, they might increase to their numbers a full third, and the whole of them be better provided for than they are now.

It is a mistake, also, to suppose, as some of the Irish assert, that we are enriched at the expense of Ireland. If all the wages that the Irish earn in England were transmitted to Ireland—if all the payments of the Government to Ireland on account of gifts, loans, &c., were balanced against the revenue and rent of Ireland transmitted to England—we doubt whether the pecuniary balance during the last five years would be in our favour. We have, however, no accurate data for making such a comparison; but we are quite sure, in comparing the wealth creating knowledge and skill of the English with those of the Irish, that we owe our greater wealth and our superiority to our greater knowledge and skill, and not to taking anything unjustly from them. Their present condition must impress on them the necessity of improvement in order to keep pace with other nations, or they will cease to have a place on the earth.

VESTIGES OF AN ANCIENT TRIBE.—A skeleton of the ancient Saxon, as was discovered a few days ago in burying the rock in Mr. Dowse's quarry, at Nutshill, under a bed of moss, about 6 feet below the surface. The skeleton appeared to be lying on its face, and laid on the clay which immediately overlies the rock to the depth of four or five feet. The vertebræ measured [illegible] The bones [illegible] small and [illegible] ... [illegible] ... [illegible] ...

PARLIAMENTARY PORTRAITS.

WILLIAM BROWN, ESQ., M.P FOR SOUTH LANCASHIRE

THE honourable member, eldest son of Alexander Brown, of Ballymeas, county Antrim, was born at that place in the May of 1784. At twelve years of age he was placed for education under the care of the Rev. J. Bradley, at Catterick, near Richmond, in Yorkshire, from whence, in 1800, he returned to Ireland, and soon afterwards sailed with his father and mother for the United States of America, and at Baltimore, where his father continued the linen trade, in which he had been engaged in Ireland, received in the counting-house his commercial education. In a few years the house at Baltimore became the firm of Alexander Brown and Sons, consisting of the father and his sons, William, John, George, and James. In 1809 William returned to England, established a branch of the firm in Liverpool, and they shortly afterwards abandoned the exclusive linen business, and became general merchants.

The transactions of the firm soon extended so as to require further branches, and James established himself at New York, and John at Philadelphia; and, on the death of their father, the business, then the most extensive in the American trade, was continued by these four brothers. George remaining in Baltimore.

During the war, in addition to its trading transactions, the house, from its high commercial character, became of necessity engaged in banking transactions, their known connexions on both sides of the Atlantic giving assurance that bills on America or England would be accepted and paid without advice, which the chances of war might have rendered it matter of extreme difficulty and delay to have forwarded, and in this portion of its business the house became in after years most extensively known.

The close of the year 1836 encountered a period of unequalled commercial difficulty, the pressure of which was felt with the utmost severity in the American trade. The disastrous aspect of affairs from 1837 to 1839 induced the brothers George and John, who had by that time realised ample fortunes, to retire from the firm, leaving William, the eldest, and James, the youngest, to continue the concern. 600 American banks had failed, it was impossible to obtain remittances from the United States to England, all confidence was destroyed. The firm held American bills for a very large amount, and of which between £700,000 and £800,000 were protested for non payment. Their own resources were a good deal locked up in stocks and other securities, and bills in the hands of the American partners. No bills were to be depended upon for it was impossible to say what houses on either side of the Atlantic were safe—nor was space to be had for remittance to meet the engagements of the house in Liverpool, and which at that period amounted to £1,500,000. So extensive were the commercial transactions of the house, which in the previous year had turned over more than ten millions, and the annual average dealings of which may have been and are about seven millions, that any stoppage, however temporary, would have added in an almost incalculable degree to the commercial embarrassment of the period. But the house had ample resources for every engagement; and, on a statement of its affairs by the house, the Bank of England at once agreed to make them an advance of £1,950,000. His partners deposited in the United States Bank bills and other securities to the amount of £4,000,000, to the credit of the Bank of England, and which was, in addition to securities to the amount of £1,000,000, deposited with the Bank itself.

The United States Bank was then in full tide of prosperity, and it was proposed by the partners of the house in America to forward a letter of credit which the bank had agreed to give for £1,000,000, to the Bank of England, which would have cost the firm a commission of two and a half per cent., or a bulk sum of £10,000, an expedient which however defeated; but the election was the signal for the forty-shilling freehold agitation of the League; and on the resignation of Lord Ellesmere, in 1846, so completely had the condition of the country been changed, that Mr. Brown, again put in nomination, was returned without opposition, the chances of a contest being felt to be too large, especially on the general election, in 1847, he was invited by a requisition, signed by Lord [illegible] Pelham Villiers, bearing upwards of [illegible] and most numerously signed requisition that was ever presented to any candidate again to come forward. Mr. Villiers declined to become a candidate, being unwilling to retire from Wolverhampton, the borough by which he had been first returned, and the support of which he had had in the early, and apparently almost hopeless, period of the struggle for Free Trade. Mr. Villiers was, however, put in nomination, both candidates were returned without opposition, but Mr. Villiers elected to sit for his old and tried constituency.

Mr. Brown first spoke in the House on Lord John Russell's motion, January 27, 1847, for the continued temporary suspension of the Corn and Navigation Laws, in consequence of the deficiency of the harvest in England, and the continued failure of the Irish potato crop. The hon. member on that occasion rose in reply to the late Lord George Bentinck, who had censured the Government for not having prohibited the export of corn from Ireland, and for not having placed the bonding in abeyance, when, had it been continued, 3,000,000 quarters of foreign corn would have been in bond, which Government might have purchased and have sold, less the duty, to the great relief of the Irish people. We are anxious to the proposed by Lord George carried the day. Mr. Brown, who, when a famine raged in Persia, hunged, with his money-bags at his feet, an Armenian merchant, who having, in common with others, kept his corn in store for the rise of price, was found to have the greatest quantity. In answer to [illegible] fact that a famine had occurred at Antioch, in the reign of Julian. The Emperor, adopting the policy recommended by the noble Lord, fixed a price for corn, which being lower than that of the surrounding country, the merchants passed by Antioch as an unprofitable market, and so, by the good intentions of the Emperor, the people were more starved than ever. There was also another Eastern case in point. Some years since a famine occurred at Guzerat [illegible] head at Bombay. The Council, after anxious deliberation, resolved to prevent its free export to the famine-stricken [illegible] not a day passed without grain-laden ships dropping their anchors at Bombay; so that the supply was well maintained. As to the dealers in grain, on whom such severe reflections had been cast, they simply bought at one time to sell again when scarcity was more severe. They took nothing from the whole supply of corn, but used their capital for a more equitable distribution over the period of want, and he therefore considered them a most useful class of [illegible].

Lord John Russell subsequently, in the course of the debate, complimented the honourable member on his speech. Mr. Brown also took part in the adjourned debate (July 15) on Lord G. Bentinck's proposal of an advance to Irish railways, arguing that the £4,000,000 proposed would in reality be a premium to speculators. He admitted that it might be advisable that in some cases the Government should advance, say a third of the sum required for the completion of our important undertaking, but it was altogether out of the question to require the whole amount for entire works, and [illegible] as to mortgage the property of Irish proprietors for railway loans, which better investments were to be found. In the debate during the same session, March 7, on the Factories Bill, Mr. Brown opposed the measure on the ground that it would be a hindrance to commercial progress. The thirty years' trial had made a difference in the [illegible] and other countries; her competitor [illegible] Germany, Belgium, France, and the United States, [illegible] as a farthing a pound turned the scale in favour of one country or the other. Subsequently, he opposed a clause, to enact, that, after a little preliminary inconvenience, but reaped great [illegible] from the facilities [illegible] accounts, making for the prevention of frauds, by the adoption of the decimal system. In the course of the debate on the Government money [illegible] loans [illegible] Mr. B. [illegible] credit in all the great seats of commerce and manufactures; even [illegible] orders to the United States, had [illegible] countermanded, houses fearing to have bills drawn upon them which it might not please the Bank to discount. The manufacturing towns found that good bills could not be turned into money to pay their workpeople, and therefore declined to accept them. He proposed, as one means of remedy, an issue of £1 notes, which would bring a considerable amount of the £20,000,000 or £40,000,000 of gold in circulation into the Bank, and so enable them to meet the requirements of the mercantile community on easier terms; but, the urgency of the case being over, again to call in the £1 notes.

In the sessions of 1848-49 and 1850, Mr. Brown took part in the debates on the Irish famine, the Sugar Duties, Repeal of the Navigation laws, and, in reply to a speech of Mr. John O'Connell, went into an elaborate statement on accounts of Irish trade and taxes, to show that, since the Union, Ireland had enjoyed exemptions to an immense amount.

In 1850, he carried on, through the columns of the *Freeman's Journal*, a correspondence with Mr. Horace Greeley, of Boston newspaper, a correspondence which, Mr. Greeley believed, led the Treasury of the United States, and a Protectionist, and the present American Minister, Mr. Lawrence, in defence of Free Trade, and the letters attracted a considerable amount of attention and [illegible] in the public journals on both sides the Atlantic.

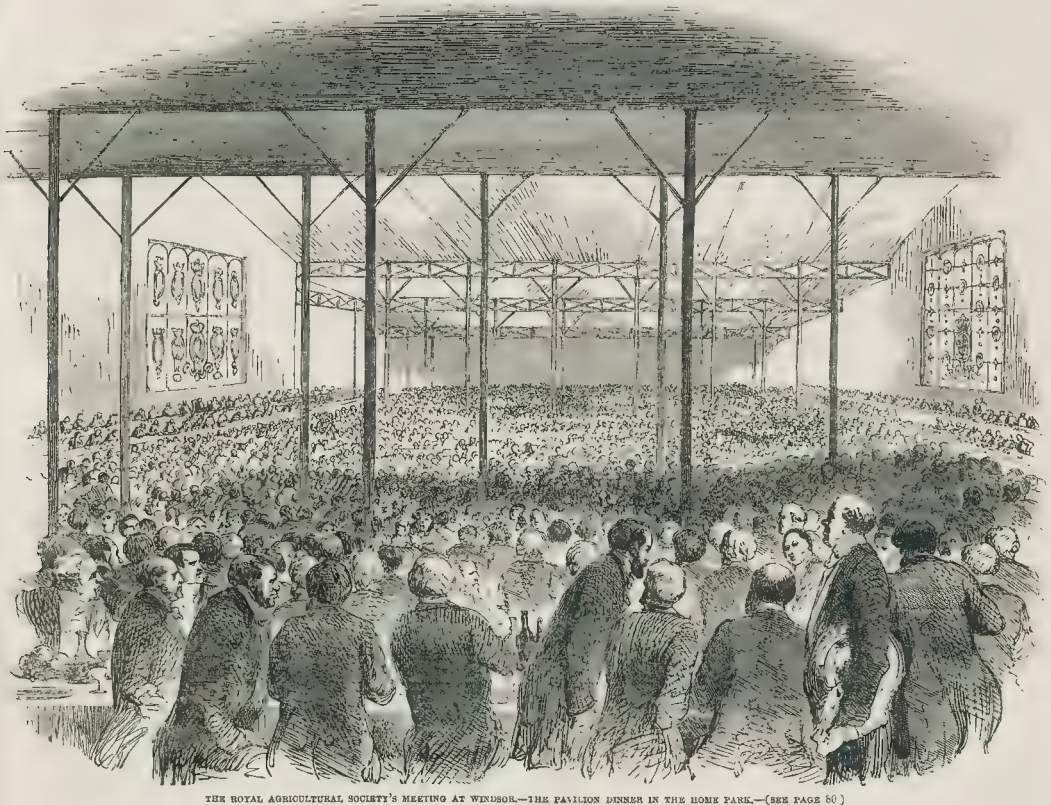
THE NEW SYSTEM OF TAXATION.

THE late Sir Robert Peel was not a man who courted popularity. If what he thought his duty demanded it, he braved odium and censure, the loss of friends, and the bitterness of enemies. All the ties that public men consider the most dear he was willing to sacrifice to his sense of right and justice. His brilliant and useful life was a continuous record of such high resolves manfully carried out. But it may be doubted whether, on one great occasion, he did not strive to catch the support of the poorer classes, by means which were not in strict accordance with the justice which was in other instances the guiding-star of his policy. When he reformed the commercial tariff, and prepared the way for the abolition of the Corn-laws, he extended the principle of direct taxation in a manner which showed the skilful contriver rather than the severely just and conscientious statesman. In imposing a war-tax in time of peace, in order that the poor and industrious might have cheaper food, and that trade, commerce, and manufactures might be allowed their natural expansion, it was not necessary to commit a new injustice. It was, perhaps, expedient for the moment; but it was neither just nor safe, considered with regard to the future, that in relieving the bulk of the people from some portion of the burden of indirect taxation, he should have placed the whole burden of the direct imposts upon the shoulders of a few. In doing this, he introduced a new and dangerous principle, to which it was not thought worth while to make any determined resistance, because the great Minister only asked the innovation for a short and transitionary period, and because the injustice committed against the few possessing more than £150 per annum was felt to be the means of relieving all other classes in the country—those few included among the rest—from still more serious and injurious burdens.

But now, when the whole current of our financial legislation, supported by public opinion, runs in favour of the perpetuation of direct taxation and of the diminution of all taxes that impede the legitimate and wholesome developments of trade and industry, it becomes of the utmost importance that Sir Robert Peel's arrangement of the Property and Income Tax should be carefully reconsidered. If he introduced a measure partial in its operation and unjust in its pressure, there is no reason why the statesmen who have followed him should, in admiration of his general policy, imitate him in its flaws, and why they should commit an injustice permanently which he never intended should endure beyond a short and stipulated period. But the present Ministry, it would appear, have not only determined to uphold the policy of their illustrious predecessor with regard to the arbitrary assumption that no one possessing property or earning income of a less amount than £150 per annum should be called upon to pay the property and income tax, but they have extended the principle in another direction. The Chancellor of the Exchequer—beyond all comparison the most inefficient Minister of modern times—has not clearness of vision to see, or courage to follow out, the real financial policy of Sir Robert Peel, but contents himself with imitating it in its weakest and most objectionable parts. Because that statesman, in an emergency which has passed away, and to secure an object which is no longer necessary, relieved of liability to the income and property tax the possessors of £149 19s. 11d. per annum, Sir Charles Wood thinks it incumbent upon him to relieve from the burden of his new house tax all houses paying a rental under £20 per annum, or six-sevenths of the whole house property of the kingdom. If that be not the reason which has actuated Sir Charles Wood, we confess our inability to discover any other. Nothing can be more ill-judged, more unjust, or more dangerous, than such a course of legislation. If we must have a house tax, and a property and income tax—if the necessities of the State are such that the Government cannot dispense with both or either of them, the least that can be done is, that these inevitable evils should be made to press as fairly as possible upon all. There is no class in the country, however humble, which is not directly as well as indirectly interested in the stability of the Government, and in the inviolability of public credit; and there is no class that ought to be entirely relieved from contributing, according to its means, towards that fund of taxation without which the whole social fabric must fall to pieces. The attempt of Sir Robert Peel, in the first instance, and the more glaring and inexcusable attempt of Sir Charles Wood and Lord John Russell at the present time, to affix the weight of taxation upon the minority, within a limit arbitrarily fixed, is unjust and inexpedient. If, while Sir



THE ROYAL AGRICULTURAL SOCIETY'S MEETING AT WINDSOR.—THE PAVILION DINNER IN THE HOME PARK.—(SEE PAGE 50)

Charles Wood is employed on the one hand in relieving the mass of the people from burdens that must be borne under the penalty of bankruptcy and revolution, Lord John Russell is employed on the other in extending the suffrage among those very persons whom Sir Charles Wood permits to live tax free, we may naturally expect, at no distant time, to see a recklessness in the expenditure of the public money, to which, with all our past extravagance as a nation, we have hitherto been unaccustomed. If the principle be a correct one, that there should be no taxation without representation, the converse should be equally correct, that there should be no representation without taxation. If our Parliaments are to be elected under Lord John Russell's new Reform Bill by people living in houses paying less than £20 rent, and in the enjoyment of incomes somewhat less than £150 per annum; and if the principle is to be conceded that such remissions of taxation from one class, and impositions upon another, are just and proper, it is not difficult to foresee that Communism, such as would gladden the hearts of M. Proudhon and M. Cabet, though it have no dwelling-place in France, will soon find a home and sanctuary in England. The "haves" will be at the mercy of the "have-nots," with or without the ballot; and Parliaments elected by the many will have no business so popular as to mulct the few.

The only safe, because the only just, principle to go upon—if there must be a property-tax and a house-tax—is to make all property and all houses fairly liable. There is no sanctity in £149 per annum, which should enable its possessor to escape the contribution which falls upon £151; and there is nothing about a nineteen guinea house which should enable its occupier to enjoy the protection of law and government without paying for it, in the same proportion as the man who occupies another house rented a pound or a shilling higher. But the whole system is based upon an error and a wrong, and ought to be manfully resisted. We have not a word to say against direct taxation, or against those two forms of it to which we have more particularly alluded. On the contrary, we believe the system of direct taxation to be the most salutary of all systems; and if but made impartial in its operation, and accompanied by measures of relief from imposts that interfere with trade and industry, it is likely to work well, and give satisfaction to all classes; but against the system, as interpreted by the present Government, we feel called upon to protest. Such exemptions as Sir Robert Peel introduced, and Sir Charles Wood extended, are direct encouragements to political and personal dishonesty. They undermine the morality of the nation. They teach the people to evade the payments expected of them, and are fraught with present injustice and with future mischief.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

THE REV. SIR HENRY RIVERS, BART.

THE worthy Baronet died suddenly at his residence, Rhode Hill, near Lyme Regis, on the 7th inst., aged 72. On the afternoon of that day he walked out through Mr. Gordon's park, and was seized with a fit of epilepsy, which terminated fatally. Sir Henry was the 9th baronet of his family, and the 8th in descent from Sir John Rivers, Kt., of Chalford, in Kent, Lord Mayor of London (temp. Queen Elizabeth). He married, 2d May, 1812, Charlotte, daughter of Samuel Bates, Esq., and had a numerous issue. The eldest surviving son is now Sir James Francis Rivers, Bart. The Rectory of Martyr Worthy, Hants, was held by the late Sir Henry for more than 30 years.

SIR EDWARD HARDINGE JOHN STRACEY, BART., OF RACKHEATH HALL, NORFOLK.

THIS venerable Baronet died on the 14th instant, at Rackheath Hall, aged 82. He was the eldest son of the late Edward Stracey, of Rackheath, who was created a Baronet October 3, 1818, and grandson of Sir John Stracey, Knt., Recorder of London. Sir Edward married, July 17, 1810, Ann, daughter and heir of William Brookbank, of Nesbit, county of Chester, and had issue by his lady (who survives him) one son and one daughter, both of whom died without issue in 1832. The Baronetcy now devolves on Sir Edward's brother.

SIR JOHN AUGUSTUS FRANCIS SIMPKINSON, Q.C., F.R.S

THE death of this learned advocate, one of her Majesty's Counsel, occurred on the 8th inst., at his residence, 21, Bedford-place. Sir Francis had a talent his 70th year.

He was the only son of the Rev. John Simpkinson, M.A., rector of Cliffe, and vicar of Cobham, Surrey, by Rende, second daughter and co-heiress of Abraham Wesselcomb, private secretary and aide-de-camp to Peter the Great, and afterwards his ambassador to the Courts of Sweden and Vienna. Sir Francis was one of the oldest members of the bar, standing third in seniority of the Queen's Counsel. He had been leader of the Equity Court of Exchequer before its abolition, and enjoyed an unusually extensive practice, especially in title cases, in which branch he was second only to the late Mr. Botelier. He was a Bencher of Lincoln's Inn, and had been treasurer in 1845, the year in which her Majesty opened the new hall and library, on which occasion he received the honour of knighthood. He was married to Mary, daughter of J. Griffin, Esq., and sister to Lady Frankland, by whom he has left several children.

SIR GEORGE SMITH GIBBES.

SIR GEORGE SMITH GIBBES, M.D., [illegible] in Ordinary to the Queen, Physician to the Royal Household, and Member of the Council of the Royal College of Physicians, London, died on the 23rd inst., at Cobham, Surrey, in his 74th year. His medical profession was a very successful one. He was elected for the [illegible] was an honorary physician extraordinary to Queen Charlotte [illegible] over of the Royal College of Physicians, London, and for [illegible] of the eldest sons of Sir George Gibbes one [illegible] [illegible] wrote some popular treatises on [illegible] [illegible] years in the Philosophical Transactions," in Nicholson's, in Tilloch's, and in Thomson's Annals Transactions."

Sir George, who had for some years retired from the profession, and was in [illegible] possession of the property of Shaftesbury, [illegible], Bart., a daughter of the late Edward Bagley, Esq., of Bridgwater, and Castle-Mercian county of Somerset, to which he died in 1822; he married secondly [illegible] of the late Captain Thomas Chapman, of the 23rd Regiment. Sir George Gibbes died on the 23rd inst., at Exmouth, Devonshire, aged eighty.

DR. M. MOIR.

IN [illegible] we have to add to our Obituary the honoured name of Dr. Moir, of Musselburgh—the gifted "Delta" of *Blackwood's Magazine*. He died at Dumfries, on Sunday, the 6th inst. His loss will be severely felt in the medical and in the literary world. Dr. Moir was one of the first contributors to *Blackwood*, and in his many articles in that Magazine, as well as in separate publications of poetry, he stood deservedly high; and the crowded and [illegible] last winter by his able lectures on the subject will not soon forget the [illegible] from personal observation.

Dr. Moir leaves a widow and eight children, the eldest married to Dr. Scott, the partner of his father-in-law. By his fellow-townsmen—by all, indeed, who knew him, he was much beloved, and at the request of the inhabitants of Musselburgh, his funeral was a public one.

EDWARD QUILLINAN, ESQ.

THIS accomplished gentleman, whose death occurred after a few days' illness, was as much esteemed as a superior scholar and an able critic. Precision of style, and propriety of remark, altogether devoid of ill-nature, character and the composition which he knew and that contributed to the periodical press. For many years past Mr. Quillinan had taken up his abode in the lovely valley between Ambleside and Rydal, near the residence of William Wordsworth, in whose family he was connected, having by marriage with Dora, second daughter of the name. He married, 4th Feb., 1817, Jemima Anne Deborah, second daughter of the late Sir Egerton Brydges, Bart. (who [illegible] his life by a [illegible] holy connection, 24th June, 1824); and, secondly, the only daughter of the poet Wordsworth, whom he survives but about four years.

Mr. Quillinan served as a cavalry officer.

Charitable bequest by the Late Abraham G. H. Buttersby, Esq., [illegible] Society, £500; Hull Humane Society, £500; Seamen's Orphan Institution Society, £500; British Church Pastoral Aid Society, £500; British Orphan Asylum, £100; Bristol Penitentiary Society, £100; Bristol Diocesan Visiting Society, £50; Bristol Samaritan Friend Society, £50; [illegible] Bristol Society, £50; Bristol Dorcas Society, £10; and [illegible] Colleges, Manchester, £500. The testator's personal estate [illegible] duty on £8 000, to be divided among [illegible]

Mr. Benjamin, of Knutsford, Cheshire, has bequeathed £1,000 to the London Orphan Asylum, £1,000 to the Asylum for the Indigent Blind, £1,000 to the Asylum for Orphan Girls, £1,000 to the Asylum for Female Orphans, £1,000 to the Asylum for Aged Widows, £1,000 to the Asylum for Aged Christian Females, £1,000 to the Asylum for Aged Christian Females, £1,000 to the Asylum for Aged Christian Females

IMPERIAL PARLIAMENT.

HOUSE OF COMMONS.—SATURDAY.

The House had a short sitting at noon.

The Weeds and Forests Bill was read a third time and passed, after a few observations from Lord DUNCAN, who described it as one of the most important measures of the session.

A brief debate took place upon the motion for the third reading of the Civil Bills (Ireland) Bill. The third reading was carried, and the bill was passed, after an unsuccessful attempt by Mr M'Mahon to modify one of the clauses.

Several other bills were advanced a stage, and the House adjourned to Monday.

HOUSE OF LORDS.—MONDAY.

THE CRYSTAL PALACE.

Lord CAMPBELL presented a petition against the continuance of the Crystal Palace. His Lordship stated that the first name on the list was that of his learned Brother, Mr. Justice Crossse; and amongst other names of the greatest sanctity and distinction were those of the venerable mother of the Earl of Clarendon, and of the sister of Lord Auckland. The petitioners expressed a wish, which he believed was unanimous and not personal to all classes, that at the termination of the Exhibition the Crystal Palace might appear only in history, and several clergymen joined in the prayer of the petition, who desired, for the sake of morality, that the Commissioners should not be absolved from the solemn pledge which they had given that the Building should be removed. An active agitation was going on upon this question at present, the ground of which he believed was, that the health and enjoyment of the people would be promoted by allowing the Crystal Palace to remain in its place. He would be promoted by allowing the Crystal Palace to remain in its place. He would be promoted by allowing the Crystal Palace to remain in its place. He

THE "CITY OF MANCHESTER" SCREW STEAMER.

shallow foundations, and an absence of fire-proof shutters. I believe that many of the brick buildings might have been saved and the fire arrested, had an inside shutter been used, composed of sheet iron and such dreadnought as is used in powder magazines.

I enclose you also a Sketch of the remains of the buildings of Starkey Brothers and Co.: these gentlemen, together with several of the first firms in the city, are already installed in temporary buildings, and in full operation.

THE "CITY OF MANCHESTER" SCREW STEAMER.

THIS splendid ship was launched on Saturday, the 14th of June, from Messrs. Tod and M'Gregor's building yard, Kelvin Dock, Glasgow, in the presence of a very large concourse of the citizens; and such is the celerity in these matters, that within three weeks it was expected the vessel would be complete and ready for sea, so as to be enabled to sail from Liverpool on her first voyage on July 25. The ceremony of naming the *City* was gracefully performed by Miss Agnes Henderson, second daughter of George Henderson, Esq., of Glasgow. A platform had been erected at some elevation under the bow, whence the bottle was dashed against the ship's stem as she began to slide onwards into the water. After the launch a large number of ladies and gentlemen were invited to partake of the hospitality of Mr and Mrs. M'Gregor.

is the property of the Liverpool and Philadelphia Company. She is to be com-

The *City of Manchester* is the largest screw steamer ever built on the Clyde, and manded by Captain Campbell, well known on the Cunard line. The *City* is intended to sail between Liverpool and Philadelphia, as a consort to the well known and favourite steam-ship *City of Glasgow*, and in connexion with the new American built screw steam-ships *Pittsburg* and *City of Philadelphia*.

As the *City of Manchester* lay on the water, an excellent opportunity was afforded for appreciating her beautiful proportions and graceful lines. Notwithstanding her length, and the height of her top-sides, there is no appearance of walk,dedness; and her entrance and run appear both admirably adapted for quick sailing and for affording a weatherly buoyancy in heavy gales. Her draught of water, when launched, was about seven feet. The following are some of her principal dimensions: Length of deck, 274 feet; breadth of beam, 37 9-10 feet; length from spanker-boom end to jib-boom end, 339. She registers 2195 tons, and will be propelled by engines of 400 horse-power, actuating a three-bladed screw. Her two foremasts are formed of iron, tubular, of course, but of great strength.

As an instance of almost unprecedented dispatch, it is worthy of notice that her three large boilers, each weighing 30 tons, were all got on board on the Saturday evening after the launch, and fixed in their places.

PARLIAMENTARY PORTRAITS.

THE EARL OF ARUNDEL AND SURREY, LATE M.P. FOR ARUNDEL

HENRY GRANVILLE FITZ-ALAN HOWARD, eldest son of the present (13th) Duke of Norfolk, by the eldest daughter of the 1st Duke of Sutherland, was born at Great Stanhope-street, London, Nov. 7, 1815; prepared for the university by a private tutor, and in 1832 entered Trinity College, Cambridge. Being a Roman Catholic, he could not take a

THE EARL OF ARUNDEL AND SURREY.—FROM A PHOTOGRAPH BY KILBURN.

degree; and having remained at the college a year, went abroad in 1834, and spent some time in travelling on the Continent. In 1835 he entered the army as a cornet in the Royal Horse Guards, in which he remained until 1837, when he retired; and was appointed a magistrate for the county of Sussex, and in 1838 for Middlesex. At the general election, on the accession of her present Majesty, in the same year, he contested Arundel, in opposition to Lord Dudley Stuart, who had represented the borough for some years, and whom he defeated; and at the subsequent elections, in 1841 and 1847, he was returned without opposition.

His Lordship first spoke in the House in the debate, March 29, 1844, on the second reading of the Factories Education Bill. The great want of education in the manufacturing districts had led to the introduction of the bill, which, he believed, was drawn with great fairness, and of which he generally approved. As a Roman Catholic he felt bound to declare that, as long as there was a church establishment in Ireland he must protest against any system of private or national education which Parliament might establish; but he asked for a full and secure protection for those who were not of that church. If the words in the bill, "reading the Scriptures," included expounding them, he must object at once; the least suspicion of such an intention must militate against the usefulness of the measure. It would also be considered a grievance, if Roman Catholic children should be obliged to attend the service of the Protestant church, unless their parents or next of kin made formal objection: and he therefore trusted that Sir James Graham would introduce a provision that children registered or baptized as Roman Catholics, should, as a matter of course, be allowed to absent themselves. The Roman Catholics contributed their share to the poor-rates, a portion of which was now to go to education; generally speaking, they were a poor class, many of their schools were badly circumstanced; in many instances they were unable to build school-houses, and he would therefore venture to suggest, that a small grant of money should be made toward the efficient support of some of their schools.

On the second reading of the Charitable Donations (Ireland) Bill, July 29, 1844, which constituted, on an improved basis, a commission for the administration of charitable bequests, of which the Master of the Rolls, the Chief Baron of the Exchequer, and Judge of the Prerogative Court were *ex-officio* members, there being besides five Protestant and five Roman Catholic Commissioners, and which provided that matters regarding the doctrine, discipline, and constitution of the Church of Rome should be referred to the Roman Catholic members only, and that parties so piously disposed might, without limitation as to amount, apply their real and personal property to the maintenance of chapels and residences for the Roman Catholic clergy, and the support of the pastors, but which, however, introduced the proviso, new to Ireland, that lands and property by will or deed must not be given within a very short time before the death of the testator, Lord Arundel expressed his thanks to the Government for the measure, and urged them to consider whether the Bishops and Archbishops of the Romish Church could not be recognised in the Bill. The suggestion was adopted, and they were named in the Act with the honorary titles. His Lordship also took part in the debate on the second reading of the Maynooth College Bill, moved by the late Sir Robert Peel on the 11th of April, 1845, and took occasion to remark upon the position of opposition to many of his usual supporters in which the right hon. Baronet, by bringing forward the measure, had placed himself, but in which, to his humble but unqualified admiration

GRAND ENTERTAINMENT TO THE AMERICAN MINISTER, AT WILLIS'S ROOMS, ST. JAMES'S.—(SEE NEXT

has shown himself with intrepid calmness, and firm in his determination to do justice, and to need the support of every true statesman.

The Lordship, in a few words, gave his support to the Roman Catholic Relief Bill of 1846 . . . measure tending to do away so far with what re... of religious disability . . . and supported the Free Trade policy of the late Sir Robert Peel, and the subsequent measures of the present Gov...

... the last debate on the Government Education Scheme, April 2nd ... complained that whilst Roman Catholics contributed ... to the State, they alone were excluded from participation ... made by the State for the purposes of education, ... down by the Committee ... which did not object for the rights of ... were ... from a great national effort to spread knowledge among ... the people, Roman Catholics alone should be excluded; but, though they of his faith were to be shut out, he would not, therefore, retaliate by ... to deprive others of a measure of benefit, and should ... the bill. In the face of all the excitement this measure had ... he was determined to find that it was religious feeling ... and ... ... the Ironsides of Cromwell to the demons of the French Revolution. The old English faith was gone, but the deep religious feeling ... remained, and when ... and that religious feeling were accompanied with some shade of intolerance, let them treat it with tenderness and soothe it with love; let them check the religious feeling, and true to God for the faith.

In the adjourned debate on the Jewish Disabilities Bill, December 17th ... same speech, Lord Lyndhurst, ... whose father and grandfather had been in former years forbidden account of their faith to take their proper ... in the Legislature, supported the claims of the Jews ... and ... voted in favour of every measure since brought forward for the ...

On the second reading of the bill, in the session of 1849, to legalise ... with a decided majority, Lord Arundel said that the ... resolutions from the Pope as to such marriages were proof that, in his opinion, ... were not held contrary to the law of God; and that the appointed ... considered it unjust, that the la... as it stood, ... of persons so married by dispensation from ... ... and because it was also unjust to all Dissenters approved of ... ages, and to the number of the ... England who agreed with those Dissenters. Great social evils ... from the ... as it stood, and real advantages would result from its ...

The debate of April 17th, 1850, on Mr. W. J. Fox's Education Bill, ... Lordship spoke in opposition to it in full, and in the ... ground that secular ... was not more valuable than religious ... to lead to it. ... Lordship has in every stage opposed the Ecclesiastical Titles ... ... that the Roman Catholics are no less loyal subjects of Her ... than those of any other religious persuasion; that there was no intention of ... upon any temporal authority on the part of the Pope; that the nomination of the B... is purely an act of church government; and the bill before Parliament a measure of ... ... is that perfect equality, of tolerance which should be ... to all for us of both.

On the passing of the bill, Lord Arundel on the 7th of July ... pted the Chiltern Hundreds, and published in the following week an address to the constituency which for nearly fourteen years he had represented, stating ... through ... an unpleasant ... he had followed in his Parliamentary career the course of his conscience ... convictions; and if again returned by any other constituency, he should follow the same independent course. The resignation, thus ... unopposed by an announcement of his Lordship's intention to re-enter Parliament, tends to confirm the opinion that he has withdrawn from the representation of Arundel in consequence of a difference of views on the Papal Aggression measure with the Duke of Norfolk, whose influence is paramount in the borough.

In 1847, Lord Arundel published, at Dolman's, 61, New Bond-street, a pamphlet, entitled, "A few remarks on the Social and Political Condition of the British Catholic," in which he quotes many of the highest authorities of the Church to evidence the allegiance rendered by Roman Catholics to the Pope's temporal authority, as described by the Queen's and states and argues against the laws to be found on the statute-books imposing disabilities on Roman Catholics, and so interfering with the free exercise of Christian belief. In 1848 he published two other pamphlets ... entitled to show that the Reformation in England was ... ... not to rely on account of its non-publication since 1773 (an opinion which his Lordship had advanced in the course of the debate on the Roman Catholic Relief Bill, in 1829), but from the fact that, even at the time of its last ... publication, many ... were not enforced, and that, since its publication, contrary customs had come to prevail. The other pamphlet is ... to certain Roman Catholic objections to the establishment of diplomatic relations with Rome.

Lord Arundel ... June 18, 1... 8, Augusta Mary Minna Catherine, ... daughter of Sir Edward Lyons, Bart., and has by her a son and four ...

The Band of the First Life Guards will perform, by permission of Colonel Hall, at Four o'Clock, on every SATURDAY, until further notice.—Admission ONE SHILLING, on Monday HALF-A-CROWN.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JULY 19, 1851.

THE Earl of Derby's motion for a Select Committee of the House of Lords to consider the papers relative to the representative institutions granted to the Cape of Good Hope, led on Tuesday night to one of the most interesting and important debates of the session. His Lordship gave a succinct history of the colony, and of the causes which led to its present unhappy differences with the Colonial Office, but failed to carry the House of the necessity of conveying a direct, or indirect, vote of censure upon Earl Grey and his Ministry. The question, as truly stated by the Earl of Derby, is a most difficult and complicated one; and we much fear that the largeness of the minority, and the narrow escape of the Ministry from a defeat, will, when known at the Cape, tend very greatly to increase the difficulties of all parties, both in the Colony and at home. The Cabinet turned more particularly upon the legislative limits to govern themselves by means of the free institutions, which, whatever the Colonial Office may be, the mother country is willing to grant them, but incidentally included many other topics of interest to all our colonies, and to the whole people of great Britain. The Cape Colony is not a favourite: its oldest inhabitants are of anen extraction; they do not even speak the English language, and realize all the [illegible] to no peculiar affection; while we principally hear of it at home as being engaged in most expensive wars which it does not pay for, and in enacting laws which look very like rebellion to our lawful authority. There is a growing feeling in this country that the Cape is not worth what it costs us; and a strong desire that it may have and enjoy the free institutions which it demands, or anything else, provided it will make friends and not enemies—the Kaffirs without troubling us about them, and cease to bring in large bills for wars, which are of no interest or advantage to the people of England, and the expense of which prevents our Government from abolishing many injurious taxes, of which they might otherwise be enabled to relieve us. The system pursued at the Colonial Office no doubt needs reform, and perhaps Earl Grey is not the most conciliatory of Colonial Ministers; but it cannot be asserted that the Cape Colonists have not been much to blame in producing the present difficulties and embarrassments. But such results are unfortunately no novelties in colonies that are obtained by conquest from foreign nations, and not by the settlement of Englishmen. The French in Canada, and the Dutch at the Cape, have added the animosities of race and origin to all the other difficulties in the way of a good understanding with this country; and it may be doubted whether the Boers of the Cape are not greatly more hostile to the English than the Kaffirs themselves. Perhaps, however, if the Boers and the Kaffirs were left to settle their differences without the assistance of British gold and British bayonets, the Boers and their party ere long might entertain a more grateful sense than they do now of the value of a British connexion.

"WHAT is to become of the Crystal Palace?" is still a question which engages the public attention, and which will continue to engage it until an authoritative and final decision be obtained. A war rages in the press and in Parliament, the hot artillery of public meetings and petitions is employed, and all sorts of arguments are pressed *pro* and *con.* into the service. Lord Campbell is at the head of the Parliamentary party in the Upper House who clamour for the removal of the Building; and we suppose that the chieftainship of the same party in the Lower Chamber devolves of right upon Colonel Sibthorp. Lord Campbell argues as a mere city lawyer, and, for the first time in his life, perhaps, will not advocate the customary common sense to guide him. His Lordship admits the Crystal Palace to be a "wonder of the world,' thinks "Mr. Paxton an honour to his country," that the "success of the Exhibition has been splendid and unexampled," that "it will have a tendency to harmonize and civilize the world," that its "ideal creation confer the highest glory on Prince Albert" and says many other fine things in praise of the Exhibition, and of all concerned in it, but he will not hear of the perpetuation of the Building as a Winter Garden. He thinks it has served its purpose, and argues that it ought to be demolished, because, before such a Building was ever dreamt of, application was made to Parliament for the site for a purely temporary purpose. He will not, upon faith being kept with the owners and occupiers of house property in the neighbourhood; treats Mr. Paxton as a mere visionary, and himself as a man of genius—one of the privileged old, stupid, and false sense of human wisdom is unappreciable. He doubts his legal arguments by that of a lawyer, who is "a lawyer, a scholar, and a gentleman," and more generally by those of several ladies, peers and persons of distinction, many a parish priest in the clergy of the neighbourhood, who object to a Winter Garden upon the ground of danger to public morality. The legal argument is proved, however, upon as good authority as even the high authority of Lord Campbell and Mr. Justice Cresswell to be of no worth; for the same Parliament that granted the sight for a temporary purpose, can grant it for a lengthened period, or in perpetuity, if so inclined, even although a few persons owning or occupying houses in the neighbourhood might be found to object. The argument of the ladies and the peers is, no doubt, to be respected; but we think, that for one lady and one peer who object to the scheme of a Winter Garden, there might be found ten thousand ladies, and two or three score of peers, who would hold a contrary opinion in which, moreover, they would be backed by the unanimous vote of the public. The clerical argument we hold to be simply ludicrous. Possibly, if we had a beautiful Winter Garden, with flowers, and trees, and fountains, and statues, it might be made a place for assignations; but what then? Assignations are before now been made at church doors, and even in church pews; but we never heard it argued, that, for that reason, there ought to be no churches. As regards the allegation of the injury to property in the neighbourhood—which would amount to nothing, if true, because the public, which required the sacrifice, would grant compensation—to some extent answered by a short and business letter from Lord Listowel. His Lordship, who is owner in fee of the land on which the houses immediately opposite the Crystal Palace are built, dissents entirely from the opinion of some of the occupiers of those houses who signed a petition against the permanency of the Building, and states, that, although owner of the land, he was never asked for his signature to the petition, and that he never knew of its existence until Lord Campbell presented it to the House. His Lordship adds his belief, not only that all Mr. Paxton's anticipations will be amply realised—that the Crystal Palace will be made the most beautiful conservatory and most magnificent sculpture gallery in the world, but that the value of property in the neighbourhood, so far from being diminished, will be greatly increased! His Lordship's letter is an answer to most of the reasoning employed on this part of the subject. But the discussion rests with Parliament alone, and we think there is very little, if any, doubt what the result will be. We have had the Crystal Palace, and we shall continue to have it; and, as in the instance of the Exhibition, present opponents will be converted into future friends.

COURT AND HAUT TON.

THE COURT AT BUCKINGHAM PALACE.

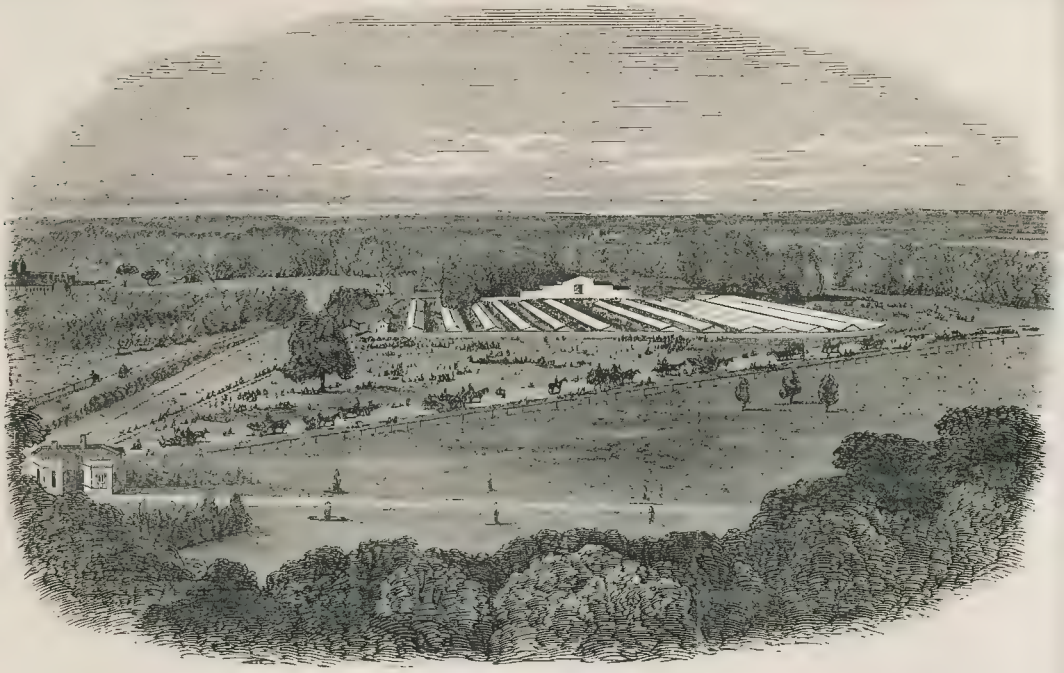
Her Majesty and the Prince Consort, accompanied by the youthful members of the Royal Family, and attended by the ladies and gentlemen of the Royal household, left Buckingham Palace for Windsor Castle on Saturday last. The Royal party occupied five carriages, and was escorted by a detachment of the 8th Hussars from the Palace to the Paddington terminus of the Great Western Railway, where a special train was in readiness to convey the [illegible] at which place her Majesty arrived at five o'clock.

On Sunday her Majesty [illegible] the Prince of Wales, [illegible] Princess Royal, [illegible] Princess Alice, [illegible] Prince Alfred, the Princess Royal, and the Princess Alice, [illegible] the Royal Agricultural society in Windsor Home Park. The Royal party arrived at [illegible] minutes before seven o'clock, and were conducted towards the different [illegible] cattle, and also inspected the pavilion. The [illegible] Prince remained about [illegible] and a half in the show-yard, [illegible] with the royal children and the ladies and gentlemen in waiting, [illegible] Castle. In the afternoon the Court returned to town, and in the evening the Queen gave a grand ball at Buckingham Palace.

On Tuesday the Queen and the Prince paid an early visit to the Great Exhibition. In the afternoon, Prince Albert, attended by Lieut.-Colonel the Hon. C. B. Phipps, and Lieut.-Colonel C. H. Seymour, left Buckingham Palace for the Brick layers' Arms station, and proceeded by railway to the residence of Mr. Cubitt, near Boxhill. The Prince afterwards visited the Philanthropic [illegible] in the Reigate Road, and returned to Buckingham Palace as a quarter [illegible] o'clock. In the evening the Court honoured the Royal Italian [illegible] performance [illegible] Lucrezia Borgia, [illegible] Castelli, [illegible] Tamberlik, [illegible] Lablache, and [illegible] Grisi. [illegible] minutes before twelve o'clock on Wednesday morning, [illegible] Prince left Buckingham Palace, and by a special train to Windsor, to be present at the dinner of the Royal Agricultural Society of England.

On Thursday the Queen and the Prince paid an early visit to the Great Exhibition. In the afternoon, Prince Albert, attended by Lieut.-Colonel the Hon. C. B. Phipps, and Lieut.-Colonel C. H. Seymour, left Buckingham Palace for the Brick layers' Arms station, and proceeded by railway to the residence of Mr. Cubitt, near Boxhill. The Prince afterwards visited the Philanthropic [illegible] in the Reigate Road, and returned to Buckingham Palace as a quarter [illegible] o'clock. In the evening the Court honoured the Royal Italian [illegible] performance [illegible] Lucrezia Borgia, [illegible] Castelli, [illegible] Tamberlik, [illegible] Lablache, and [illegible] Grisi. [illegible] minutes before twelve o'clock on Wednesday morning, [illegible] Prince

THE ROYAL AGRICULTURAL SOCIETY'S MEETING AT WINDSOR.



THE AGRICULTURAL SHOW.—SKETCHED FROM THE NORTH TERRACE OF WINDSOR CASTLE.

(*By our own Reporter.*)

THE annual Cattle Show of the Society commenced at Windsor on Monday last. It was originally fixed to take place in Hyde Park, as an adjunct to the Great Exhibition; the intended site was afterwards changed to Bushey Park; but finally, owing to a wish understood to have been expressed by her Majesty, it was finally changed to the Home Park, at Windsor, beneath the walls of whose castle the cattle-yard and pavilion are now placed. No site could have been selected more eligible for railway convenience; and it was peculiarly appropriate, as proving to her subjects and the numerous foreign visitors the deep interest taken by our most gracious Queen, in the welfare of agriculture. The authorities at Windsor had by placard expressed a desire that the inhabitants would do honour to the occasion by displaying banners, flags, and other festive symbols—a request that was warmly responded to, the main thoroughfares of Windsor being gay with streamers and colours of every description; not a few of the ancient hostelries, associated with "Falstaff" and "The Merry Wives," being gaily and tastefully decorated with devices and mottoes composed of laurel, intermixed with flowers.

Windsor Castle, for the first time, had flying from its battlements the flags of every nation, the "star-spangled banner" being not the least numerous or conspicuous.

At the entrance of the ground, where the cattle-yard and dinner pavilion were placed, a triumphal arch had been erected. It consisted of three lofty arches, surmounted by a crown of laurel over the centre: on the side opposite to Windsor was inscribed "Speed the Plough!" and on the reverse "Long live the Queen and Prince Albert!" The structure was most appropriately decorated with agricultural implements, combined with specimens of farming produce, which had a most graceful and charming effect.

At eleven o'clock on Monday morning the cattle yard was honoured by her Majesty and his Royal Highness Prince Albert, and suite. The Royal party was received by the noble President, the Duke of Richmond; Mr. Raymond Barker and Mr. Brandreth Gibbs, the director and steward of the cattle yard.

After inspecting the show-yard, her Majesty and the Royal party proceeded to the dining pavilion, where they were received by the Hon. R. H. Clive, M.P., and Mr. Shaw, stewards, together with Mr. Hudson, the secretary of the society. On leaving, her Majesty expressed herself highly gratified with the Exhibition in its various arrangements.

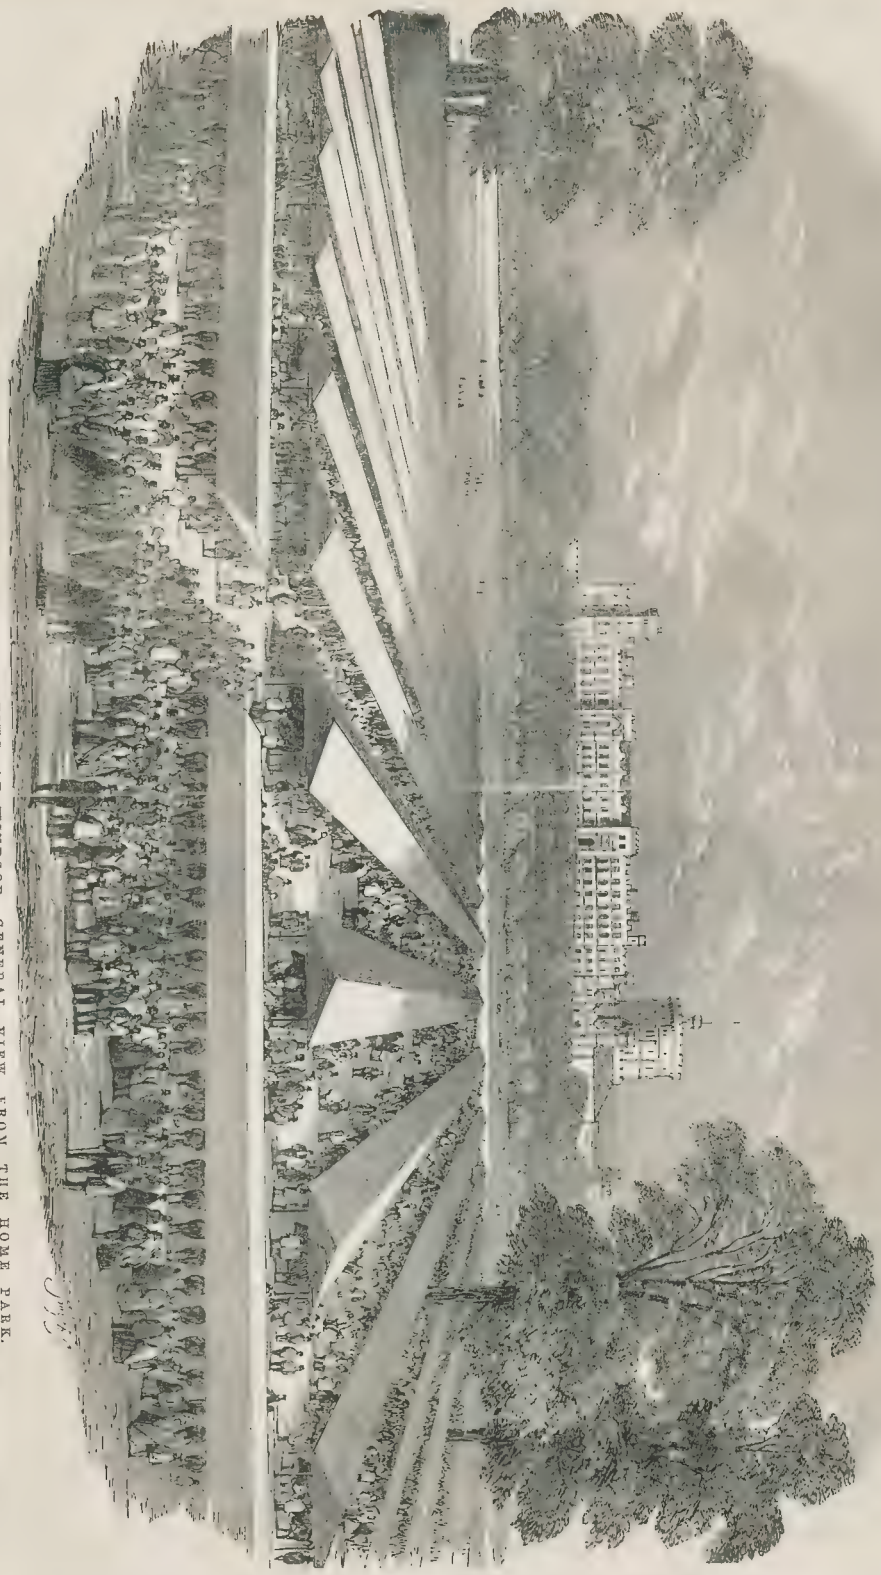
The entries of stock were more numerous than on any former occasion, the greatest increase having taken place in the class of sheep. This may in some degree be accounted for from the fact, that double the amount of prizes was given away this year.

The short-horns were very good, which may be conceived from the fact, that nearly whole classes have been commended and highly commended. The prizes in this class have been distributed to a number of districts farther separated than in any other class—a pretty clear proof of the wide extent of country over which their merits are appreciated.

The Herefords were good, but did not present any remarkable points of excellence over those shown at previous meetings—the greatest novelty being the appearance of Lord Berwick in the capacity of a most successful exhibitor, having carried off four prizes in this class.

With respect to the Devons, it would be impossible to describe the beauty of these animals, which even surpassed those shown last year at Exeter, their native district. Mr. John Quartly, and that fine specimen of the honest upright English farmer, Mr. George Turner, of Barton

ARRIVAL OF THE CATTLE.



THE ROYAL AGRICULTURAL SOCIETY'S MEETING AT WINDSOR.—GENERAL VIEW, FROM THE HOME PARK.

succeeded in obtaining the most valuable and numerous prizes. An inspection of these beautiful animals alone would amply repay a journey to Windsor.

We shall reserve further observations upon the character of the stock until we engrave some of the finest prize specimens next week.

There was no display of Implements at Windsor, as, according to special arrangement, these appurtenances to farming are exhibited at the Glass Palace, Hyde Park; Engravings of several of the most important are given this day in the Supplement to the ILLUSTRATED LONDON NEWS; where, also, is given the List of Prizes awarded by the Society.

On Tuesday, the admission to the show-yard was reduced to 5s., the attendance being very numerous; a very large number of the visitors were natives of France, Belgium, and Holland, the French appearing to take the deepest interest in the show.

On Wednesday, the price was reduced to 2s. 6d., and the show-yard was crowded with visitors at a very early hour. On each day a number of ladies were present, which greatly enlivened the scene. Very shortly after four o'clock, the dinner hour, the yard was comparatively deserted.

THE GRAND PAVILION DINNER.

Shortly before four o'clock his Royal Highness Prince Albert arrived at the station of the South-Western Railway, accompanied by the Marquis of Abercorn; where he was received by his Grace the Duke of Richmond, the President of the Society, and several of the most distinguished members of the Council, and conducted at once to the Grand Pavilion, which was erected at one of the extremities of the Show-yard. This elegant structure, a representation of which interior is given upon the front page of this Number, presented at the moment of his Royal Highness's arrival a most animated appearance—the whole assembly (every seat being previously occupied) rose en masse, and gave utterance to their feelings of respect by hearty rounds of cheering.

At the *table d'honneur* were seated the Duke of Richmond, and at his right hand his Royal Highness Prince Albert and M. Van de Weyer, the Belgian Minister; and on his left the Mayor of Windsor; and Mr. Lawrence, the American Minister. In their immediate vicinity were the Marquis of Abercorn, Lord Ashburton, Earl Powis, the Earl of March, Lord Feversham, the Earl of Portsmouth, Turkish Ambassador, Prince Demidoff (the proprietor of the celebrated malachite and iron mines), the United States Ministers at Brussels and at St. Petersburg, Baron de Beth ann Hollwig, Baron Sporcken, Count Harrach, M. Dumas and M. Payen, the celebrated French chemists; Count de Lippe, Prince Frederick of Schleswig-Holstein, Prince Augustus Four of Prussia, Earl of Leicester, Lord Bradport, Lord Walsingham, Lord Kinnaird, Lord Vivian, the Earl of Cavaleon, and a large number of Members of Parliament and distinguished foreigners.

The Vice-Chair was occupied (in the absence of Earl Dudie, the President elect) by Lord Portman, in whose vicinity were seated Mr. Philip Pusey, M.P., Lord Lifford, the Marquess of Hastings, Baron Goldmidt; Baron Mackenzie, the Belgian Commissioner; Sir John Johnstone, M.P.; Col. Wood, M.P.; Mr. Shaney, Dr. Lyon Playfair, and Professors Simmonds, Way, Scott, and Johnston.

The Chairman, on rising to [illegible] the first toast, was received with enthusiastic [illegible] he said, was a toast always acknowledged at the meetings of [illegible] with intense and heartfelt approbation. "The [illegible] of the Queen." (Loud cheers.) By the kind permission of her Majesty, they met under the roof of the Royal Castle of Windsor, illustrated by historic recollections. The agriculturists, in weal or woe, would ever be loyal to the Crown, would ever give their strenuous support to the institutions of their father-land, and be devotedly attached to the person of their most gracious Queen. (Drunk with enthusiastic applause.)

The Chairman then, in a complimentary speech, proposed "the health of Prince Albert," which was rapturously received.

His Royal Highness Prince Albert said, a [illegible] had been restored. My Lord Duke, my Lords and Gentlemen,—Sensible of the honour you have done me, I can assure you that the kind way in which you have received the toast will never be forgotten by me. Some years have elapsed since I last dined with you in this imposing pavilion, and I am rejoiced that you have this day placed it under the walls of Windsor Castle, and that I have personally the opportunity of bidding you a hearty welcome in the Home Park.

Your encampment singularly contrasts with that formed by the Barons of England, the feudal Lords of the land near Windsor Castle, on a similar mead. They came clad in steel, with lance and war-horse. You [illegible] a more peaceful attire; and the arms you bring with you are tokens of your successful cultivation of the arts of peace. (Cheers.) King John came trembling amongst his subjects, unwillingly compelled to sign the great charter which has since been your country's and your Sovereign's, last Monday, came confidingly among her loyal and loving people; she came to admire the results of their industry, and to encourage them to persevere in their exertions; and this gathering, which the Queen has left the quiet sight of your splendid collection, must, I am sure, be participated in by all who examined it. I am sonly pleased at this success, because it is witnessed by so many visitors from foreign lands, and also because I feel it a certain duty fully personally responsible for having deprived you of one of the most interesting features of your show, agricultural machines, implements, and fruits. Though separated from your collection, I am sure I may safely say that another [illegible] park—(Cheers)—and you will be glad to learn, that whatever difficulty [illegible] our receiving the merits of the other industrial products of the earth, the British agricultural implements are exceptionally commended by competent and without rivals. [illegible] the privileges allowed me I now propose the toast, "Prosperity to the [illegible] Agricultural Society of England." (Cheers.) Your exhibitions, the means of [illegible] they have afforded, and the stimulation which [illegible] have given, we are indebted to a large extent for the progress which [illegible] figure has recently made. I drink "Prosperity to the Royal Agriculture [illegible] ty of England." (Drunk with three times three, and three cheers.)

The Chairman next proposed the health of the foreign ministers. The toast having been [illegible]

M. Van de Weyer said that it was with feelings of gratitude he responded on behalf of himself and his colleagues to the flattering and eloquent compliment to the noble Chairman, whose health he proposed.

The Duke of Richmond said that he felt great pride in rising for the th[illegible] time to acknowledge the toast of the prosperity of the Royal Agricultural Society of England. With regard to the exhibition, he must say that he had never before seen so many good animals collected together in any show-yard in the world. [illegible] meetings existed no cordial feeling exactly between the tenantry of England and their landlords. He concluded by drinking all their healths.

Lord Feversham gave "Agriculture, manufactures, and commerce," which was [illegible] with great upon some sights.

[illegible] proposed "the Health of the Mayor of Windsor." The Mayor returned [illegible]

Mr. Sillis Mark, proposed in a most speech the "Stewards of the yard, and the judges of the show." Mr. Hudson, [illegible] and [illegible] responded appropriate speech

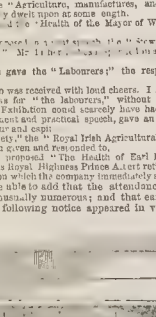
The Chairman then gave the "Labourers" the responding to which was attributed to

Lord Ashburton, who was received with loud cheers. I am commissioned (he said) to return thanks for "the labourers," without whom the boasted beauties of the Great Exhibition would scarcely have had an existence. The noble Lord, in an eloquent and practical speech, gave an able analysis of the relations between labour and capital.

The "Highland Society," the "Royal Irish Agricultural Society," and "the Bricklayers," having been given and responded to,

The Earl of Powis proposed "The Health of Earl Dudie, the President-elect;" after which his Royal Highness Prince Albert retired, amidst the most enthusiastic plaudits, which the company immediately separated.

We are glad to be able to add that the attendance of agriculturists at the Dinner was unusually numerous; and that early in the afternoon of Wednesday, the following notice appeared in various parts of the Pavilion:—



On Thursday, the admission being reduced to one shilling, the show-yard was crowded during the whole day.

METROPOLITAN NEWS.

CHARING-CROSS HOSPITAL.—On Tuesday, the fourteenth annual meeting of the governors of this institution was held in the Hospital, Upper Castle Street, in the chair. The honorary secretary, Mr. Robertson, read a [illegible] report of the managing committee, which gave a detailed account of the position and affairs of the hospital for the past year. The report congratulated the meeting on the continued prosperity of the institution, and the great benefits it was instrumental in effecting. In the course of the year 1,905 patients had been admitted on the books for relief, of which [illegible] were 1,285 out patients and 1,219 in-patients, to whom office tickets were [illegible] afforded, at a cost of £2430. The cases of accident and emergency amounted to 2765, of which 648 were so dangerous as to require treatment in the hospital. The total number of [illegible] relieved since the [illegible] institution from its commencement is 186,863. Legacies to the amount of £1000 have been received during the past year. The negotiation alluded to at the previous annual meeting, between the commissioners of Woods and Forests, for the purchase of the freehold of the hospital, and payment of the rent due to the Crown, has since been carried into effect, at a cost for the freehold of £7000 and £3493 in equitation of the arrears of rent. The financial statement records from benefactions, subscriptions, dividends, &c., to the [illegible] expenditure under various heads, £2430; the greater part of the balance has been applied to the fund for the purchase of the freehold, and to investment in stock; bearing £318 8s. 2d. at present in hand. The medical school of the hospital was described as in a satisfactory condition, and the prizes to the successful students will be awarded at the end of the present month.

ROYAL SEA BATHING INFIRMARY.—A festival in aid of the funds of this institution took place on Wednesday, at the London Tavern, Bishopsgate-street, Mr. B. Bond Cabbell, M.P., in the chair. The cloth having been removed at the conclusion of an excellent dinner, the chairman proceeded to the usual loyal toasts, and, after these, that of the evening was given in behalf of the Infirmary." It appeared that the charity on behalf of which the present was established for the especial treatment of scrofula; and that it was required was evident from the number of applications from children and infants annually, of which but a portion could be received. The committee had also been compelled to refuse admission to many adults, from the want of funds, although they were in every way deserving objects of charity. The institution had been

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

M. Daguerre, the celebrated inventor of the daguerréotype, died on the [illegible] at his residence Bry-sur-Marne, a village near Paris, in the 63rd year of his age. He had been originally a scene painter.

The mortal remains of Madame Letitia [mother of the Emperor Napoleon], and of Cardinal Fesch, have been removed from Rome to Ajaccio, in Corsica, the native place of the Bonaparte family. The Corsican papers of the [illegible] contain long accounts of the ceremonies at the reinterment of the remains of some of the members of the Bonaparte family appear to have been [illegible]

White to play, and mate in four moves.

THE CRYSTAL PALACE.

(To the Editor of the ILLUSTRATED LONDON NEWS.*)*

SIR,—In a part of the "China" department in the Crystal Palace, I have noticed a novel combination of glasses, producing a convex lens or burning glass, with the effect during the late hot weat er on the Chinese specimen of carving on an English carmel-coal snuff-box from the Ote-hills, Shropshire. Previous to the hot weather, the box was as hard as ebony; but, on the 29th of June, 1851, I found it at the top quite *sticky*; and, had it not been removed from the rays of the sun, no doubt it would have been blistered and become soft, thereby softening the sharp points of the deep cutting of the carving. It is whilst there [illegible] and on bad the [illegible] [illegible] covered with [illegible] canvass, [illegible] inches [illegible] above the glass, forming a sun-[illegible] [illegible] [illegible] canvass on the glass acts as a retainer of heat. In [illegible] [illegible] matter of the Crystal Palace, I must say they gave immediate directions to remove my cabinet into a shady part, in order that no ray of the sun might effect the snuff-box or any of the other specimens before going to me.

C. S.

THE O'BYRNE TESTIMONIAL.—A meeting of naval officers for the presentation of a testimonial to Mr. O'Byrne, the author of "The Naval Biography," takes place at the United Service Institution, Whitehall, to-day, the 19th, at twelve o'clock. Admiral Sir Charles Adam presides.

It is understood that Lieutenant-General the Right Honourable Sir Frederick Adam, G.C.B., will receive the appointment of Governor of Malta, together with the command of the troops stationed in that island. Sir Frederick served many years in the Mediterranean, with the army in Sicily, and subsequently held the High Commissioner in the Ionian Islands, from which he was removed upon his appointment to the Madras Presidency in 1832.

GREAT GATHERING OF JUVENILE ABSTAINERS AT EDINBURGH

ON Saturday, the 5th instant, the locality of the Queen's Park, and the picturesque city of Edinburgh generally, was the scene of the novel and beautiful demonstration, 70,000 strong, of which our Artist, Mr. L. Ghémar, has furnished two striking illustrations. For several years back, Mr. John Hope, of Morayplace, Edinburgh—leaving the adult generation to think and act for themselves—has, amongst other benevolent and religious exertions, directed his zeal to the attempt to educate and train in habits of abstinence, superadded to the acquisition of school instruction, the youth of both sexes, by the organization of a "British League of Juvenile Abstainers." This effort is the more worthy of remark, though not intended extending merely to Scotland, because of the host of stigmas which has attached to the character of the people in that country, and the hopes the extensive ramifications of the league hold out of seeing a more temperate, and, as an obvious consequence, a more rising up in succession to those who have been pronounced, the bowdies excepted, "the most drunken nation on the face of the earth." It would be difficult to tell how greatly Mr Hope is honored and esteemed for his having his wealth in furtherance of this cause, and especially since he has adopted the resolution of basing the movement on a sound system of instruction in evening classes, comprehending not only the ordinary branches of education for children, apprentices, and young men and females, but many others, in singing, drawing, French, botany, &c., utterly unattainable by the same classes of young people in the usual way. As a mark of reward for good behaviour, or even attendance in those of the highest class in the town and country [illegible], as well as to associate together the children and young people [illegible] for the enjoyment of a general [illegible] on a certain day each season was devised by Mr. Hope, who, effecting arrangements on a large scale with the various railways converging on Edinburgh, has in this manner enabled to get a peep [illegible] to the extensive scenery of Gosford House, the estate of the Earl of Wemyss, in Haddingtonshire (East Lothian), and Hopetoun House, the seat of the Earl of Hopetoun, in Linlithgowshire (West Lothian), and this year assembled them in increased numbers, discipline, and still luxury, from all points of the compass, to visit the ornamental capital of Mid Lothian and of Scotland.

The assemblage of the Edinburgh juveniles commenced at the early hour of seven in the morning; and from that hour or at least from eight A.M., the [illegible] Leith and Musselburgh, Edinburgh, Perth, and Dundee Railways [illegible] and Scottish Central Railways began to pour in their [illegible] of juvenile visitors were landed; some, by the Caledonian, not arriving [illegible] however, till after the meeting in the Queen's Park was far advanced. The boys were ranged in one division the girls in another; the one under the charge of male, the other of female superintendents, and generally in little corps of from 30 to 40. Neat dress and gaily attired, it was beautiful to see the little army [illegible] all parts of the Edinburgh streets waiting for the admission by the [illegible] the various musicians and public places, which [illegible] as a city of the Government, the magistracy and public bodies [illegible] [illegible] Since the [illegible] hereof, [illegible] [illegible] coming from the several places. [illegible] with cabs, [illegible] [illegible] [illegible] [illegible] (at three [illegible] [illegible] [illegible] [illegible]

GREAT GATHERING OF JUVENILE ABSTAINERS, AT EDINBURGH.—THE PROCESSION PASSING THE SCOTT MONUMENT.

copy of a printed address on this occasion, but that they were still in the steampress, and would be duly sent to them when they reached their respective homes; but he proposed one cheer for Mr. Sinclair, and stated, as an advantage of that proposal, that Mr. Sinclair would have to reply, and that something in the shape of an address might be made out of him. Hearty cheers having been given,

Mr. Sinclair thanked the company. In allusion to the magnitude of the meeting, he had never despaired, he said, that the teetotallers would by and by cope with the whisky bottlers. (Cheers and laughter.) But let them look to their laurels. They would not be satisfied with *little* meetings. (Cheers.) And great as the present might be, their Glasgow friends threatened by and by to hold a larger one on Glasgow-green. (Great cheering.) He begged to explain to those unacquainted with their system, that they not only taught the children abstinence, but taught them to look up to a higher Being, and enjoy his works of creation and providence. (Applause.) He, in conclusion, called upon them to come forward and prosecute the mighty work, trusting that Providence would raise up many men like their esteemed Mr. Hope, whose labours under Providence had been blessed with such results as they now beheld.

The Rev. Mr. Logan Ackman having pronounced the benediction, the vast juvenile assemblage told off into their respective companies, slowly and regularly defiled from the park—those who had left the statuary or any other of the sights unvisited, proceeding to see them; but the majority proceeding to the railway stations for the trains destined to convey them to their homes. The sculptor, Mr. Forrest, has since reported, that, although visited by some 26,000, his statuary has been completely free from injury; and, so far as we have learnt, not the slightest accident occurred to mar in any respect the felicity of this monster demonstration.

THE PROCESSION ENTERING THE PALACE OF HOLYROOD.

MDLLE. RACHEL, IN "VALERIA."

We this week present a portrait of this unrivalled *tragédienne*, in the character of *Valeria*—seated as in the first act of the play, while *Claudius* revels until he slumbers. There is the immovable and expressive attitude, careful not to disturb the Emperor in the process of which the issue is anxiously awaited. The morality of the play has been impugned; but, we think, on insufficient grounds. The Empress, as drawn in this drama, is certainly not guiltless; but is there no moral in shewing that the fidelity of woman cannot be assured to the glutton and the sot? A wife so fatally allied, may and should preserve what is due to her own character, but can scarcely be kept in the path of honour by any respect for her demented husband. In this instance, the husband is not only head of the house but of the state, and all the disorders in both flow from him as their source and fountain. The lesson which such a story teaches is analogous to all that is ever taught by the imperial as distinguished from the domestic drama. The imperial play deals with great crimes and great punishments. The mind is purposely startled and subdued by the magnitude of the transgression and the grandeur of the vengeance: the terrible malediction of the gods presides over its catastrophe. The one fault of the present production is its want of poetic style. "Valeria" is decidedly a melodrama: the outline is magnificent, but the filling up is feeble. What is wanting however, the actress abundantly supplies.

THE AMERICAN LADIES' NEW COSTUME.—(SEE NEXT PAGE.)

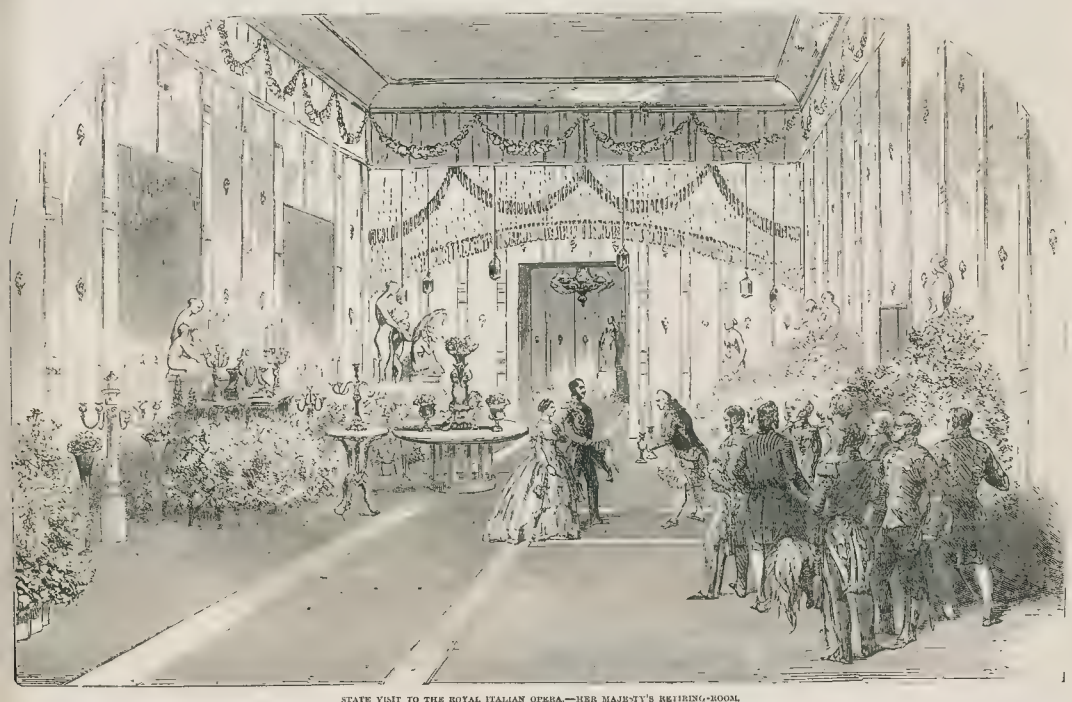
MADEMOISELLE RACHEL AS "VALERIA."

THE QUEEN'S STATE VISIT TO THE ROYAL ITALIAN OPERA.

The Queen went in State to the Royal Italian Opera, on the 10th inst., to honour the first representation of Mozart's work, "Il Flauto Magico," with her presence. The Royal *cortège* left Buckingham Palace shortly before eight o'clock, in nine carriages, the last of which conveyed her Majesty the Queen and H.R.H. Prince Albert. Her Majesty's escort to the theatre was a detachment of Life Guards. The streets on the line of the procession were filled with spectators, who loudly cheered the Queen. The Royal carriages entered by Hart-street, at the special entrance reserved for the Royal family. Setting down in the courtyard of the theatre, her Majesty ascended her own private staircase, and passing through the rich suite of rooms attached to the Royal box, which on this occasion was occupied by her Royal Highness the Duchess of Kent, entered the grand tier, through corridors lined with white and gold hangings, studded with filigree emblems and flowers, by the grand *foyer* or saloon, especially fitted up for the ceremonial as her Majesty's retiring-room. At each extremity of this saloon, crystal curtains, intermingled with ruby drops, most brilliantly lighted up with gas, were suspended, and large mirrors were placed in every panel. Before these colossal looking-glasses were stands of geraniums, disposed in a pyramidal form; and exquisite specimens of marble statuary were located amidst the floral groups. Magnificent candelabra, and costly furniture, with articles of *virtu*, filled the saloon. The approach to the Royal box on the grand tier was separated by partitions from the other boxes. As on the occasion of the State Visit under Mr. Delafield's lesseeship, in 1848, the Royal box, according to the Continental custom, was placed in the centre of the house, no less than fourteen boxes from the grand, pit, and first tiers being selected for the accommodation of the Queen and officers of State. The *façade* of the Royal box was carried over the passage in the pit, as far as the back row of seats extended; and the two Yeomen of the Guard (beefeaters) stood on a platform in the pit. The former curve in the *façade*, according to Albano's original design, was changed into convex, a similar style of ornament being used, so as not to disturb the harmony of the general descriptive front of the grand tier. The form of the State box was oval, and on each side were boxes set apart for the members of the suite. From the tier over the grand was suspended a canopy, or rather a massive burnished gold band; and this was surmounted by a crown most elaborately worked, and supported by draped flags of the finest gold and silver tissue—a very beautiful ornament, and novel in effect. The curtains suspended from the canopy were of rich India and crimson gold damask, ornamented with the most exquisite Brussels lace, giving a remarkably light and elegant aspect to the whole. The interior of the Royal box was tastefully fitted up with white satin on a figured ground, upon which, at intervals, were pilasters ornamented with filigree gold lace in elegant emblems, and studded with miniature bouquets of artificial flowers. The iron columns were entwined with flowers, interlaced with Brussels dentelle, candelabra being hung thereon. The chairs of State for the Queen and the Prince were in the centre of the Royal box, behind which stood the members of the Royal household.

The Queen was received by Mr. Frederick Gye, the acting director, in full Court suit, and was conducted to the Royal carriage, at the end of the opera, about a quarter past eleven, with the same ceremonial as on her Majesty's entrance.

During the singing of the verses of the National Anthem by Castellan, Angri, and Viardot, there was the most unbounded enthusiasm. To have selected such a masterpiece as "Il Flauto Magico" for the



STATE VISIT TO THE ROYAL ITALIAN OPERA.—HER MAJESTY'S RETIRING-ROOM.

opera reflects the highest credit on the classic taste of the Royal amateurs, who were pleased to express their approbation of the execution, as well as of the beautiful decorations of the box, under Mr. Gye's direction.

THE AMERICAN LADIES' NEW COSTUME.

A decided novelty in female costume is just now absorbing much of the attention of the ladies of the northern States of America, and has excited some curiosity on this side the Atlantic. The designer of this new costume is Mrs. Amelia Bloomer, a lady of rare accomplishments and beauty, and who ably edits a newspaper in the western part of the State of New York.

The Walking Costume (which we have engraved) is thus described. The dress is a changeable figured silk, purple and white, extending two or three inches below the knee. Close sleeves can be worn with perfect ease and comfort, but less tight than the fashion of 1836; wrought muslin wristlets, about two inches in width, fitting loosely on the hand, and somewhat resembling, at first sight, wristlets with ruffles; straw hat, with four-and-a-half inch brim, lined with white silk trimmed with plain white ribbon; trowsers, same material as dress, rendered closely at the ankle, and just covering the top of the Congress shoe, the tops of which are black patent leather, finished with patent leather. The style of the trowsers may be described as Turkish; but others are worn more closely fitting, and far over the boot, *en militaire*. A black silk *cuvie*, trimmed with narrow black lace and insertion, is worn with this walking dress.

A loud editorial chorus has been raised in praise of this new costume. The *Washington Telegraph* says: "We look forward with pleasure to the day on which every well-dressed lady will be attired in garments as graceful and becoming as are the 'frock and pants' we see described in the northern papers. A few of our readers must be dissipated to make way for the improvement; but it will become as well it, that will vanish."

The *Lowell Evening Gazette* observes:—"The adoption, by some of the ladies of the city, of a style of costume, is creating a marked sensation among the observers of such things on this side the Atlantic, and seems to meet with general approval, one with particular favour among the newspaper writers. The dress fits loosely, and we presume there is no arbitrary way of getting one up farther than as regards length. It reaches just to the ankle. The trowsers are made wide and flowing, and gathered around the ankle in true Turkish style. We have always thought the Turkish women far ahead of all others in this particular, and the invention we now chronicle has been looked and hoped for, it is sanctioned by good sense and much convenience, and we trust it will meet with universal approbation with the American women."

And the *Hartford Times* says:—"We have seen a young lady dressed in the 'new costume.' There was nothing in the appearance of the garments to offend the most fastidious taste, on the contrary, they were evidently convenient, and appeared becoming and graceful. We look upon the new dress as a decided improvement upon the old."

The *Rochester Daily Democrat*, it is hinted that the ladies of that city are to "appear in public in the new costume, on the day of closing out the Bloomers. In which case the *Syracuse Journal* remarks:—"Our bath shall not wait for anything of this kind. It is no uncommon thing to meet, in passing through our streets, several ladies in the new costume, and we must say that it appears far prettier and more graceful than that generally worn."

There is, likewise, a visible gain in parlour costume, thus described:—The dress buttons but half-way up, and then has one gold or pearl button at the throat, thereby causing it to be open in front in a graceful manner, and reveal a white linen with ring gold studs.

MUSIC.

ST MARTIN'S HALL

A great choral performance took place last Wednesday night, at St Martin's Hall, under Mr John Hullah's direction, by the members of the Upper singing Schools. The first part was confined to sacred, and the second to secular compositions. The encores were for Hullah's hymn, to Bishop Heber's words, "O God, that madest earth and sky;" the hymn, by the same composer, on a Welsh melody, "Give to us peace in our time;" and Mr H. F Chorley's words, and J Wilby's madrigal, "Flora gave me fairest flowers." Among the unadorned compositions were Mendelssohn's part song, "O Lisa, O Lisa;" Lord Mornington's glee, "Here, in cool grot;" O. Gibbons's madrigal, "The silver swan;" Danby's glee, "Awake, Æolian lyre;" and Tieck's part song, "Soft y blow, ye breezes." The National Anthem terminated this pleasing entertainment, in which the students exhibited signs of progress.

MUSICAL EVENTS

The Lyric Madrigal and Glee Club gave a fourth concert at the Whittington Club, last Monday evening, conducted by Mr. Shoubridge, with Mr. J. A. Loughurst as accompanist. The programme was selected entirely from the works of the popular English composers—Sir H. R. Bishop, Horsley, Stevens, Woodward, Pound, "When the wind blows;" the glee, "The clough and crow;" the quintet "Blow, gentle gales;" the round, "Hark! 'tis the Indian drum," the glee and chorus, "The winds around us sweep;" "Sleep, gentle lady;" the glee and chorus, "The red, red wine;" the quintet, "I saw perched over the panama's gate;" the quartet and chorus "Stand! who's there?" the quartet, "Breathe, my harp," the chorus and glee, "Hail to the nightingale," the glee and chorus, "What shall we have that killed the deer?" the solo, "Come, my love," the "Dread, and even when blooming, crest," the quartet, "With phrase sad and soft," and the chorus, "The tiger couches in the wood;" and the concerted piece, "Ye Tuscan deities." The performances throughout were marked by great gratification to the audience. Between the parts, Mr. W. Rea performed a pianoforte solo.

Dr. H. Wylde gave an evening concert at Willis's Rooms last Monday, assisted by Mrs. Sims Reeves, Mr and Mrs Durrant, Herr Stigelli, M. Billet (piano), and Mr Wily (violin). In this scheme were a selection of work for full orchestra and chorus, six pianoforte concerts in F minor, an overture in F major, a concerto in F minor in symphony, and a scena and duo from an opera, all composed by Dr. Wylde.

The Distin family, with the assistance of Miss O'Connor, vocalist; and Mr. Brown, accompanist, have presented concerts at the Adelaide-street Royal Music Hall, on Monday, Wednesday, and Friday, with their usual success.

Mr. Henry Phillips, at the same locality, on the other evenings this week, has given his musical entertainment "The Village."

Mr John Parry's "Notes" are still payable at the Music Hall, Store-street, every Monday.

The clever and well-known guitarists, Don J and Don R de Clebra, had a *matinée* last Monday, at the Queen-street Rooms, aided by Mdme. de Logano, Mrs. A. Newton, Mr. F. Hodges, Miss A. Palsor (concertina), Signor Ribas (flute), and Signor Pelli, accompanyist.

The Philharmonic Society performed, at the Ablion Hall, last Tuesday, Mr. W. Glover's oratorio, "Jerusalem."

Mrs Anderson, Messrs. Francis, Land, Hall, Lockey, and Phillips sang a selection of Arca, last Wednesday, at Willis's Rooms. J. Goss's glee for four voices, "Tother day, as I sat in the sycamore shade;" and T. F. Walmesley's glee, "I wish to tune my quivering lyre" translated from Anacreon, by Lord Byron, were accored. Two madrigals, by Mr. Whitehouse, and Sir Henry Webbe's "You gave me your heart," were much admired. Next Wednesday afternoon (the 23rd), will be the last performance, when, to the above excellent singers will be added Miss H. Williams, and Mr. Whitehouse.

Messrs. H. and R. Blagrove, with the assistance of Misses Dolby and Rainforth, Messrs. Holmes, Clement, Trust, Pratten, and Lucas, gave their fourth quartet concert, on Friday, at the Mornington Rooms.

The Sacred Harmonic society performed Handel's "Messiah," at Exeter Hall, last night, connected by Costa. Of Madame Clara Novello's singing in this oratorio, we shall write next week.

Miss Ellen Day (pianist) and Mr. John Day (violinist) gave their second *matinée musicale* on Wednesday

The musical arrangements for the ensuing week will include Madame Dory's annual *matinée musicale*, Mrs. W Sinclair's morning concert, and Mr. John Parry's "Notes" on Monday; the English Glees at Willis's Rooms, on Wednesday; and the oratorio at Exeter Hall by the Sacred Harmonic Society, on Friday, under Costa's direction; the Battle on Monday, Wednesday, and Friday, and Mr H Phill ps's entertainment on Tuesday, Thursday, and Saturday, at the Adelaide-street Music Hall.

FOREIGN MUSICAL NEWS.

Meyerbeer's "Prophète" attained its hundredth representation at the Grand Opera in Paris last Monday, having been produced the 16th of April, 1849. Its success in London, Berlin, Vienna, Dresden, Stuttgardt, Hamburgh, Leipsic, Brussels, Amsterdam, and every other part of France, Belgium, and Germany, has been equally as great as in the French capital. Meyerbeer is now in Berlin, occupied with his opera, "L'Africaine," for Mdlle Massaloni. Mdlle. Gerard and Alboni as *Fidès*, in Paris; and Guasmard, now the best French tenor, as *Jean of Leyden*. The new three-act opera, by Scribe, St. Georges, and Halévy, "Le Val d'Andorre," is to be produced in the grand theatre of Windsor. Massol has been expressly engaged for the chief part, the *Wandering Jew*, and Mdlle. Lagrua, from Dresden, will make her *début* in the work. M. Gounod is commissioned to prepare a new opera for Paris. Artista's new opera, "Idegonda," has been produced successfully at Milan.

THE ARCTIC COUNCIL.—This is an historical picture, painted by Stephen Pearse, Esq., of singular merit. It represents a discussion concerning a plan of search for Sir John Franklin, and contains excellent portraits of Sir Gaorge Back, Sir William Edward Parry, Captain Edward J. Bird, Sir James Clark Ross, Sir Francis Beaufort, John Barrow, Esq., Lieut. Col. Sabine, C. B., Captain Washington, Sir Richard Bromley, and Captain Beechey.

THE WESLEYAN REFORM BAZAAR.—We visited, on Wednesday, the Hanover-square Rooms, and found these apartments occupied with useful and ornamental articles for sale in aid of the above object. Among them was a Sunderland pencil-drawing of "Three Sailors," and a portrait of "Wesley," of remarkable merit. The exhibition also included many ingenious toys and fancy structures, such as to ensure a profitable return.

The *Journal of St. Petersburg* announces that the Emperor Nicholas has conferred the order of Saint Anne, of the second class, set in diamonds, on M Carlier, Prefect of Police, in Paris.

THE THEATRES, &c.

HER MAJESTY'S.

Rossini's "Cenerentola" was revived on Saturday night, for the first appearance this season of Mdlle Alboni. In the character of the pen-ecisted heroine, she each creat in Paris and at the Royal Italian Opera in 1845 her most brilliant triumphs. The part itself exacts little dramatic power; to be simple, graceful, and unpretending is the chief characteristics; and in these points Mdlle Alboni left nothing to be desired, even if she does not look the most ill treated of *Mangnifico's* daughters. Her reception was most rapturous, and her exquisite singing soon proved that her warm, rich organ is in excellent condition. Her rich-toned and luscious voice in the contralto portion of the register is as sweet and sympathetic as ever, as was sufficiently indicated in the "Sovrano quel fato che versa," during the finale of the first act; and in the large "Nacque all' affanno" of the rondo finale: in both the excited passages the pathos of her vocalisation is irresistible. Her prodigious facility and extreme finish in roulades were duly appreciated by a house filled in the previous variations after the delivery of the theme or the rondo; herein her alternate employment of the soprano and contralto notes was quite marvellous, and the effect on the auditory was electric.

Calzolari sang the music of *Don Romiro* with taste. Lablache's drolleries in *Magnifico* were most exhilarating, and F. Lablache's *Medoro* was artistical but the representatives of the two unnatural sisters and *Dandini* were worse than insignificant—they were intolerable, and the general execration looked as if the performers had been improved so frequent were the contrarieties and vicissitudes; but the lovely tones of Alboni were magical answer to soothe the discontent of the subscribers.

After's last opera, "La Corbeille d'Oranges," expressly composed for the inimitable contralto, and produced recently at the Grand Opera, in Paris, will be represented here for the first time next Tuesday, Mdlle. Alboni expanding in her original part, *Zerline*. What a rare treat Rossini's "Donna del Lago," with Mdme. Sontag and Mdlle. Alboni, Gardoni, Casalori, and Lablache, would be! Places for either of these would indeed be a premium.

On Tuesday night, Scribe and Thalberg's "Florinda" was given for the fourth time, with the attractive *divertissement*, "Les Graces," in which Rosati, Mdme. Taglioni, and Grahn appeared gracefully, and the animated Spanish dancers gave some of their characteristic pas.

On Wednesday night, Mozart's "Nozze di Figaro" was performed for the second time. The strong features in the cast were, the *Susanna* of Sontag, the *Countess* of Mdme. Rosati, and the *Figaro* of Mdlle. Sofie Cruvelli, and the *Basilio* of Labloche. The grandest piece of singing was that of the Titan of *bassi* in the "Vendetta"—a manificent treading of a noble air. Next in importance must be ranked Sontag's delicious singing in the "Voi che sapete, Inginocchiatevi," so replete with archness, and the "Deh vieni, non tardar," so full of sentiment and refinement. Mdme. Florentina's lady like deportment and acting in the Countess's scenes must add to her reputation; the "Dove sono" was very elegantly sung; and her share of the "Sull' aria" duo with Sontag assisted to create its encore. Cruvelli's *Page* is rather suited to her figure than her voice; but her "Non so piu cosa son, cosa sapete," she won a deserved encore, but complete y spoiled the theme the second time by her unwarrantable liberties with the text. She plays an amusing part in the ensemble, and exerting herself to the best of her abilities in the finale scene, as well as her colleagues on the stage. "Les Graces," and "La Ferdinanda," by the Spanish dancers, completed the extra night's programme.

On Thursday night, Meyerbeer's "Il Prophète," was represented for the ninth time, by "special desire" of her Majesty and Prince Albert, who had on a previous occasion commanded its performance. This work will gain on every rehearing, and with its most recent *mise en scène* and powerful cast is decidedly the most perfect representation of the six novelties produced.

Madame Sontag, Madame Ugo de, Mdlle Rosati, M. Massol, Signori Gardoni, Mercuri ali, and Coletti exerted themselves strenuously on this occasion. The Spanish dancers completed the entertainment. There was a very good attendance.

The Queen arrived at the close of the third act.

"La Cenerentola" was announced for repetition last night, for the second appearance of Mdlle. Alboni.

This evening (Saturday) Verdi's "Ernani will be revived for Mdlle. S. Cruvelli, and Mr. Sims Reeves.

ROYAL ITALIAN OPERA.

Mozart's opera "Il Flauto Magico" was announced for Saturday; but owing to the indisposition of Mdlle Zerr, Meyerbeer's "Prophète" was substituted, and a remarkably fine version it was. Mdlle. Vaneri and Mario, as *Fidès* and *Jean of Leyden*, singing and acting to perfection, and being ably seconded by Mdme. Castle, as *Bertha*, Polonini, Tagliafico, and Formès in the other characters. Crowds visited the pretty little theatre in St Mary Axe de-pointed for the Queen's State visit, the room not having been disturbed, to enable the subscribers to see the arrangements, which are de cribed elsewhere

On Tuesday night "Le Fauvi Magico" was given for the second time. Mdlle Zerr still being *hors de combat*, the part of the *Queen of Night* was undertaken, at a short notice, by our gifted country woman Miss Louisa Pyne, whose reception in the try no *débût* was very enthusiastic. Nervous as she naturally was, her vocalisation was perfectly free and flexible; her execution of the *fioriture* was decidedly more finished than that of Lo Vaneses *prima donna*, but is more truthful and pleasing. At the period of Miss Louisa Pyne's first appearance on the Italian stage, she was engaged for her services at the Royal Italian Opera, as the successor of Mdlle. Corbari, for whom no adequate *debût* has yet been secured, and the fact that the director of the Italian Opera in Vienna had offered her the same, is, we think, sufficient evidence that her abilities had not been overrated; but Tuesday's performance of the *Queen of Night* quite settles the question as to her competency, and we are delighted to record her distinguished success in the part.

The general execution of "Il Flauto Magico" is unprecedentedly great. Mdme. Grisi's reading of the air "Non la so" raises her reputation as a singer of classic music, and Mario's exquisite singing of the music of *Tamino*, including the duet air, "O cara imagine," is also deserving of the highest eulogium. As for Madame Viardot's acting and singing of *Papagena*, a part which is extremely unfavourable to display, and which she undertook at a moment's notice, the house was quite taken by storm at the inimitable comedy. Ronconi's *Sarastro* is quite equal to his *Figaro* and *Dulcamara*: no higher praise can be awarded. If the three attendants on the *Queen of Night* are very indifferent, the three Genii are good, and in Germany it were need these six parts even respectably sung. The grandeur of Formès' *High Priest* is of more importance to the piece, he was fervently encored in "Qui sdegno" (*In diesen heilig'n Hallen*).

The choral and orchestral execution in every respect worthy of the establishment; the first scene of the second act is splendidly done, and the "Possenti Numi" being finely sung by Formès and chorus; and the "Grand' Ial" is another great treat—its sublime composition, with its exquisite orchestral tragedy, being one of Mozart's noblest conceptions. The well-known overture is played to perfection; nothing can surpass the delicious colouring of this work by Costa's hand. Grieve and Telbin's Egyptian scenery is greatly admired.

Her Majesty and Prince Albert, accompanied by the Prince of Wales, the Princess Royal, and the Princess Alice, honoured the second representation of "Il Flauto Magico" with their presence.

On Thursday, for the extra night, "Le Prophète" was performed, for the fourth time. The house was crowded to excess. The Duchess of Kent occupied her Majesty's box.

This night (Saturday), "Il Flauto Magico" for the third time.

Gounod's "Sappho," produced with such success at the Grand Opera in Paris, is in active rehearsal for the Royal Italian Opera, to appear in the Italian adaptation; she was the original *Sappho* in Paris, a part now filling by Mdlle. Masson in her absence, not to interrupt the run of the work. M. Gounod is now in London. Madame Castellan, Tamberlik, Mariali, Tamburini, and Stigelli will be included in the cast.

PRINCESS'

Mr. and Mrs. Keen took their benefit on Monday, and were rewarded by a crowded house, which was attended by many fashionable and distinguished persons. Their conduct of the theatre has deserved the recognition received. The drama, new and old, is now put upon this stage with an attention which bespeaks true reverence for the genius of the poet. The places selected for the evening's entertainment were "The Gamester" and "The Honeymoon." Mrs Keen, as *Juliana*, acts admirably—a performance at once so distinct and clear as to be almost unique. Perseverance in the same course of honourable effort will lead on the management to a triumphant issue.

OLYMPIC.

A three act melodrama of the old and obsolete kind was produced on Tuesday; it will be sufficient to record the title. "The Cid Ahaar of Valencia" On Wednesday Miss Helen Faucit appeared in *Juliet*, a character which, acted as it is by her with unapproachable delicacy and grace, acquires a new charm. Miss Faucit's services should be secured *en permanence* for the London theatres. She was well supported by Mr. J. William Wallack, in *Romeo*.

FANCY BAZAAR IN AID OF THE ROYAL ORTHOPEDIC HOSPITAL.—At a meeting held on Thursday, in the board-room of the above hospital, in Bloomsbury-square, it was decided that the commencement of the fancy fair (alluded to in last week's ILLUSTRATED LONDON NEWS) would take place at Vauxhall Gardens, on the 29th and 30th instant, under the special patronage of her Majesty and a numerous list of Royal and distinguished individuals. We understand that the project will be carried out on a most superb scale.

On Monday the Orangemen of Liverpool marched in process on [illegible] commencement [illegible] of the Boyne (July 12). They came into collision at various parts of their route with bodies of Irish labourers, and the rioting resulted in the loss of some two or three lives, and it [illegible]

THE PACHA OF EGYPT.—The Lords of the Treasury having received a letter from the Foreign Office, representing that Nubar Bey has been sent to this country by the Pacha of Egypt, the Lords have caused their secretary to intimate to the Authorities, that, under the special circumstances stated to their Lordships by Lord Palmerston, they are pleased to direct that Nubar Bey may be allowed to receive his baggage duty free, as an acknowledgment of the readiness which the Pacha of Egypt has shown to comply with the wishes of her Majesty's Government in regard to the construction of a railway from Alexandria to Cairo.

THE GREAT EXHIBITION.

The *prestige* of the Crystal Palace seems to be on the increase, and the crowds which have visited it appear to be only the precursors of still greater crowds to follow. Indeed, those persons who are fortunate enough to be enabled to pay it two or three visits, only appear to be the more anxious to double or treble that number; and the wish seems likely in many instances to be realised on a large scale by the return of the thousands who have already visited London from the provinces, but who are not satisfied with the brief period they have been enabled to visit to the object of their curiosity.

The past week has been characterised by a greater number of visitors than ever; this has, doubtless, been in some degree from the meeting of the several Corporations assembled at Windsor, and the return to the metropolis from the provinces of those who have attended the great festivals and other gatherings, to enable an opportunity of examining the wonders of the Hyde Park Exhibition, and the multitudinous and the representative interests of our varied and hundred interests. One of the most remarkable, if not the most remarkable, feature of these aggregations of humanity, is the extraordinary moderate and good-humour with which the occasional uneven orders are kept from crowding at certain attractive points are met by the assembled multitude; and the patience with which each person waits his opportunity to get his share of those inestimable treasures of the species, the Penny Buns. On Tuesday, the number of persons was a larger number by upwards of 5000 than had ever been recorded in the building on any one day, the sum taken in the building for the day amounted to £3 0 9 8s. None knew, or difficulty of any kind, occurred; and, though the pressure was at times more than usually full, yet the number was more than made up by the order.

We have a very strong opinion that, notwithstanding the great crowds which have already visited the Exhibition, much greater have to come, rather by few of the association of working-men from the manufacturing districts of the north have as yet made their appearance in any probability, from the numerous and interesting facts which have been related at meetings where the shrewd mechanics from the Lancashire and Yorkshire manufacturing towns come up to gather knowledge in this Fair of Industry.

The visits of her Majesty have been very frequent during the past week; and yesterday, we understand, she attended for the last time until after the months of August. These early examinations have been so satisfactory to the Queen, that we have one and all, in this country, a right to be proud that Prince Albert so very individual display within the Building, it is to do so certainly, the method particular to steady and unblemished system of the whole. Prince Albert is, in all probability, her Majesty will be enabled to say that which few of her subjects can, that she has had seen everything in this great collection of human ingenuity and skill. By varying the objects to be examined, this desirable result appears likely to be arrived at, as any individuals with a taste and love for the beautiful in the Arts may gratify their wish with satisfaction and profit.

Thus, during the past week the Queen has examined numerous, from specimens of cloths to damasks; silks, gold and silver fabrics, and subjects as well-calculated to please as the Queen's visit to the Royal Manufactory at Windsor. Her Majesty was also pleased to express her admiration of the beautiful cases with plate glass, in which the jewellery and other descriptions of marble, as well as other beautiful mineral substances, are inserted in these slabs of a perfectly transparent and polishable nature. The specimens of the manufactures are surmounted by a roof of bent plate glass, adapted as a model for ornamental conservatories.

The discussion as to whether the Building is to be kept up or not, is warm and furious. The domestics who reside about Prince's-gate and Kensington-gore, and the pretending people of that quarter, are already alarmed, at the same time suggesting that it is well adapted for many purposes as a work and range of rooms. This entirely new article in glass manufacture, the production of large sheets of plate glass, and the bending of the same into gothic arches with pinnacles, as well as other beautiful mineral substances, are interesting features in these vast structures are surmounted by a roof of bent plate glass, adapted as a model for ornamental conservatories

The discussion as to whether the Building is to be kept up or not, is warm and furious. The domestics who reside about Prince's-gate and Kensington-gore, and the pretending people of that quarter, are already alarmed, at the same time suggesting that it is well adapted for many purposes as a work and range of rooms. This entirely new article in glass manufacture, the production of large sheets of plate glass, and the bending of the same into gothic arches with pinnacles, as well as other beautiful mineral substances, are interesting features in these vast structures, and there seems every reason to believe that they will also be unmolested.

The question as to how far the Building is to be kept up or not, is undecided, but the terms on which subscriptions were received, in appropriating any part of the building to the purpose of holding a winter garden or any other object not directly in connection with the objects of the Exhibition, has yet to be considered, and sundry pros and cons may be anticipated. Government, as it now stands, has done little for this great work except sanction it, for we do not consider a large amount of credit is due to the Building is to be devoted to the [illegible] purposes, as appears to be a very strong opinion that Government ought to pay the cost on the demand of the public who find the money; but that the funds of the Royal Commission ought not to be expended beyond the cost of the hire of the Building for the purposes of the Exhibition.

The Jury business is well in progress, but it has been determined to reserve the announcement of the awards until after the Exhibition is closed—this is nevertheless, as possible, done in such a manner that the greater part of appointed cases is which might otherwise take place; since the probabilities are, that the smallest man will think he ought to get the largest medal in the line of his principal pursuit of which he has a knowledge. Others will go to get there and back again how they could, whilst all the foreign guests passed free. We hope the Fair entertainment, of which we gave a hint in our last week's number, is properly progressing in all its branches. It appears that it is now a settled question, and that the arrangements are in progress. It is proposed to give the guests three or four days in Paris; a grand dinner and ball at the Hotel de Ville; a visit to Versailles and the "lions" of Paris, being the leading features of the *fête*.

MR. PAXTON AND LORD CAMPBELL ON THE CRYSTAL PALACE.

The following letter has been addressed to Lord Campbell by Mr. Paxton:—

TO THE RIGHT HON. LORD CAMPBELL.

My Lord,—I take the liberty of addressing the present letter to your Lordship, feeling confident you will be glad to receive any information which may reflect the misapprehensions under which you appear respecting the construction, stability, and suitableness of the Crystal Palace for the purposes intended.

In your Lordship's recent speech in the House of Peers, you are reported to have said that "a gentleman had been with you, and had told you that a winter garden upon information derived from an anonymous pamphlet, very much calculated to mislead you, and which, if true, would furnish grave objections to the continuance of the structure for the purposes for which it was erected.

I have no doubt your Lordship alludes to me. That the Building at present constructed is not stable enough to be used as a winter garden, I have myself stated in my evidence before the Lords' Committee; but that there is no way to preserve it would be to take the roof off it, and rebuild it. That two-thirds of the columns of support are in deed of wood, which will in a short time perish, and the girders below of the same, are not calculated to endure for any considerable time. But the sashes and other portions of wood-work would endure only for a very limited period, and would then have to be replaced at a very great cost.

I have not recommended this as a desirable measure, I might just mention, that, from the very commencement, when preparing my original plans of the Building, my views were to make it in every way suitable to be appropriated to a permanent use, which I have mentioned to Lord Brougham and many others as to the strength of the structure, as it now stands, is, therefore, composed of wrought and cast iron, fixed securely together, and firmly bedded in a solid foundation, and with certain modifications, which I have pointed out, a important part of the edifice, will last for ages to come. But I consider that any kind being necessary.

Every column on which the house rests is made of iron; the [illegible] in the exterior row are merely placed there for effect and to divide the sashes, but have nothing to do with the support or stability of the Building.

All the girders which form the principal supports of the [illegible] are of wrought and cast iron. There are some wooden girders, but they are introduced for effect.

Of the permanence of wooden arches and other wood-work, if kept properly painted to, we have sufficient experience to be able to form a good opinion; there are some hothouse lights at Chatsworth which have [illegible] in constant use for upwards of 10 years, and appear likely to endure for a long time.

My estimate of duration for the sash and glass work of the Crystal Palace is 50 years, but in my statement of the expenditure provision was made for renewal every 20 years. However, with care and the after expenses for maintenance could be easily sustained without a public grant, and that the terms of admission could be made such as to suit the position and wants of all classes of [illegible]

[illegible]

I remain, my Lord, your Lordship's most obedient servant,

JOSEPH PAXTON.

THE QUEEN AT SEA.—The ILLUSTRATED LONDON NEWS for last week contained a beautiful engraving of her Majesty, modelled by the Count d'Orsay, and engraved [illegible] altogether a very different composition from the [illegible] Majesty, painted on canvass by Count d'Orsay, and engraved [illegible] The model from which the present statuette is the property of Mr. [illegible] missioned a first-rate artist to transfer the work to bronze. [illegible] shortly be ready, and will be delivered in rotation, according to the order in which they were subscribed for.

Meanwhile, the model may be seen, by her permission, at Mr. Walesby's Picture Gallery, 9, Waterloo-place, Pall-Mall.

COUNTRY NEWS.

Prince Albert visited the Philanthropic Farm School at Redhill, on Saturday—the candidates being Mr. Collins and Mr. Law on, both Conservatives. Mr. Watson, Q.C., had been a candidate but two days previous to his nomination he issued an address, in which he withdrew from the contest, assigning the following reasons:—"Having considered the question of withdrawing the best advices on the subject, I found that the local influence had so far prevailed that I cannot see any reasonable hope of success if I should go to the poll. I therefore at once came home from the circuit, thanking those gentlemen in Liberal party who have given me their support." Mr. Lawson was nominated without his consent. The polling commenced on Monday, and at its close the returning officer declared the numbers to be—For Collins (Peelite) 57; for Lawson (Liberal), 64: majority for Collins, 3. There was much violence exhibited by the mob, who flung stones and sticks at Mr. Collins and his friends, and the house at which he resided some severe blows

REPRESENTATION OF ARUNDEL.—The Earl of Arundel and Surrey, who had accepted the Chiltern Hundreds, took place on Wednesday. There being no opposition to the proceedings, Edward Strutt, Esq., a partisan of the present government, who had come forward with the support of the Duke of Norfolk the proceedings passed off very quietly, little enthusiasm or excitement being evinced. Mr. Strutt was declared duly elected.

THE LIVERPOOL IMPROVEMENTS.—An improvement has been introduced into one of the steamers of the Edinburgh, Dundee, and Perth Railway, named the *Express*, which plies between Granton and Burntisland, by fitting up a splendid saloon on the after-deck, which is covered all around with plate glass.

FATAL STEAM-ENGINE ACCIDENT.—On Tuesday morning, at the confectionery of Mr. John Davenport, Buckingham-street, Strelden, one man was killed, and two others seriously injured, by the bursting of a steam-valve and a connecting-rod between the boilers and the engine. A defective rod had been detected at this place, and to remedy this defect, the engineer, Robert Robertshaw, stopped the engine by fastening down the valve, and proceeded to screw more tightly the bolt which secured it to the pipe. Whilst so engaged, the head of the bolt gave way. Robertshaw, the instant alarm to three men who were standing in the boiler-room, and they fled. Daniel Wilkins and John Crookes, were dreadfully scalded. Robertshaw himself was so severely scalded that he died in a few minutes afterwards. The two others were removed to the infirmary, and but slight hopes are entertained of their recovery

ON SATURDAY NOON, about twenty minutes past ten, as Captain Wilkie, of the Southern Company's coast, Leith, was walking in the [illegible] observed to stagger a few feet, he was immediately led into the porter's lodge, by Mr. Cullen, custom-house agent, and medical aid sent for, which promptly arrived, but the vital spark had fled. He was a man well, and universally respected, by English and Continental travellers.

FATAL BOAT ACCIDENT ON WINDERMERE.—A sad accident took place on Sunday evening last, about ten o'clock, to a party of four young men, who started for a sailing excursion from Waterhead, Windermere. They had proceeded about two miles down the lake to nearly opposite Calgarth, when a sudden squall struck the boat, which caused her to fill and go down instantly. Everything in the boat, boatermen like the four unfortunate occupants. All disappeared in a moment; and it is said that nothing was seen after the boat and its crew but a few pieces of wreck floating on the surface of the water. Of the boat and its three things belonging to the boat have since been washed ashore. The young men were all joiners at Waterhead, named Walker, Thompson, Tyson, and Garnett.

ACCIDENT BY FIRE IN A RAILWAY CARRIAGE.—Much alarm was excited on Monday among the passengers by the mail train from Exeter to Bristol, in some degree of its being discovered that one of the second class carriages was on fire. Efforts were made to alarm the engine-driver by the usual ineffectually, as the train was carried fully a mile before it was pulled up. Fortunately, it was nearing the city, and had to pass through a densely populated district, and the screams of the women in the train gave the alarm as it passed. This drew attention to the accident, the cause of which was one of the iron tires of the wheel of a carriage breaking in two, and the increased friction consequent on the irregular motion set fire to the woodwork.

A LAMENTABLE FATALITY.—Last week, Mr. Rapsey, builder, of Truro purchased at an auction there an antiquated sideboard, in which he found, jammed at the back of a drawer, a small bag, much decayed, containing a few old foreign silver coins, and one copper sovereign of the date of 1816. On the front and rear the bag, also jammed between the drawer and the back of the sideboard, was a medal and case. The medal, of silver gilt, is one of those given as prizes to the boys at the Hulsian Grammar School; and at the date of 1816 the following inscription: "Thomas Grylls Geach: Præf. Municip. Helston. Diligentiæ decus et mutuamentum. 1801." With the motto, "Mieto nova virtute puer sublimis et audax." The case bears the following inscription:—"Queen Mary, James I and II., Charles I and II., Anne, George I., II., and III.; and two tokens, a North Cornwall, 1811; and a Bristol, 1811. Also the foreign coins of Spain, Spanish, Charles III. and Philip V.; Portugal, Joseph, 1764; Denmark, Frederick, 1764; Brunswick, Wolfenbuttel, 1684; and of the Swiss Cantons, Berne, Basle, Schaffhausen, and Schwytz. There is also a medal of Charles I. on the obverse, and a shilling inscription, Henr. Her. Rosom. 1. 8. 1644, Pro per Deum Regem et His Res. with shields bearing severally the British and French arms; on the reverse is a tree rising and spreading above several others, and the motto, "Sincerenitat omnes." It is apparently a representation of the supposed family of Charles I. and his children, and the initials I. R., and on the quarterings of a shield are arrow-heads, two arms, wa a dolphin, and a Cornish tunny caught

FATAL ACCIDENT.—Since the late accident at the North Side Colliery, Badminster, near Bristol, by which upwards of 90 men were so long imprisoned in the pit, and were at last so providentially rescued, workmen have been employed in draining the damage then done. At a quarter twelve o'clock on Saturday night, a bucket, containing a man named [illegible] was descending the shaft, when the bucket became entangled in the [illegible] of the shaft, and [illegible] fell down the shaft, a distance of 90 yards. At the same moment a man named [illegible] was descending the shaft by the ladders, and was precipitated to the bottom. Assistance was immediately rendered, but the latter was found to be quite dead, and the former was so much injured that he died in a few minutes afterwards. The two others were removed to the infirmary, and but slight hopes are entertained of their recovery

REPRESENTATION OF LIMERICK.—The Roman Catholic electors of Limerick have signed a requisition to the Earl of Arundel, inviting him to stand for their representation. A meeting has been held, at which Mr. John Dunn O'Connell, the present M.P. for the city, who is about to resign, has recommended his constituents, in the strongest manner, to select Lord Arundel as their representative.

THE IRISH POLITICAL CONVICTS.—The *Freeman's Journal* of Tuesday contains a letter from John Mitchel, from Van Diemen's Land, announcing the escape of M'Manus, one of the prisoners of 1848. He had a ticket of leave from government, who had come forward with the support of the Duke of Norfolk the proceedings passed off very quietly, little enthusiasm or excitement being evinced. Mr. Strutt was declared duly elected.

NATIONAL SPORTS.

THE ISLE There is nothing imposing in the meetings to come off in the course of the shaking week, but there is work cut out for the metropolitans, on a small scale, at Chelmsford and Guildford, and in a variety of places for the provincials. The fixtures stand as—Tuesday: Marlborough, Wrington, and Chelmsford. Wednesday: Guildford and Tiverton. Friday: Odiham and Bridgnorth.

AQUATICS.—Monday: Regattas at Greenwich, Westminster, and Fulham. Tuesday: The Leander Coat, Fulham, and Free Ium Match at Putney. Wednesday: Gravesend, Cornwall, and Cork Regattas

CRICKET.—Monday: At Hackney, Lord's, Sheffield and Shrewsbury. Tuesday: at Kennington. Wednesday: at William Green and Manchester. Thursday: at Lord's, the Oval, Cranbrook, and Langton Wold (Yorkshire). Friday: at Uxbridge.

TATTERSALL'S

MONDAY.—The subjoined quotations show a few changes, the most striking being the retirement of Escamillo to 15 to 1, layers; Lashlose, however, continues very dull.

3 to 1 [illegible]	10 to 1 agst Valentine
6 to 1 [illegible]	10 to 1 — Vivandiere
6 to 1 — [illegible]	10 to 1 — Cossack
7 to 1 [illegible]	15 to 1 — Escamillo
8 to 2 agst Money	6 to 1 agst Caithness
6 to 1 — Cossack	12 to 1 — Alnwick
4 to 1 agst Hernandez	8 to 1 agst Bluewing

TUESDAY.—A thin attendance, and nothing worthy of quotation.

STAMFORD RACES.—TUESDAY.

THE TWO-YEAR OLD STAKES of 20 sovs each, and 25 added.—Mr. Watson's f by [illegible]. Mr. R. Clark's Pontess, 2.

LUDCHLEY STAKES of 10 sovs each, with 50 added.—Lord Aboyne ns Queen, 1. Lord Cardigan's Ada, 2. Only two started.

HANDICAP PLATE of £50.—Mr. Stephenson's Brother to Willingham, 1. Mr. Rawlinson's by Bertram out of Dahlia, 2.

MAIDEN STAKES for Lords of 20 sovs each, and 25 added.—Mr. Neville's [illegible]. Lord Exeter's Cadet, 2

WEDNESDAY

SWEEPSTAKES of 10 sovs each, and 250 added.—Theseus walked over.

THE HUNTERS' STAKES of 10 sovs each, and 100 added.—Mr. Payne's Freedom, 1. Mr. Watson's France, 2.

THE GOLD CUP of 100 sovs, with 20 added.—Mr. Stephenson's Nuns, 1. Lord Lurgbley's Phlegethon, 2.

NOTTINGHAM RACES.—TUESDAY

THE NOTTINGHAMSHIRE HANDICAP.—Montague, 1. Herbert, 2

TRADESMEN'S ROWING MATCH.—The third annual contest for two pairs of oars and various other prizes, presented by Mr. Chandler, of the Ship, Millbank-row, came off on Monday. The competitors were respectively young tradesmen, and they started in a stiff gale of wind in a very spirited style. The race was in [illegible] to the bridge, and back—a mile and a quarter. Grand Heat—Lewis and James. 1. Tyson and Mac. 2. Won by three lengths

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The general tendency of the English market during the week has been to decline, chiefly, however, more from the state of the Amount (which has been *bullish*) than any other cause. Consols, on Monday, opened at 97 to 98, afterwards declining to 96¾, 97, making up the same quotations during yesterday. On Saturday the market was still less favourable, being becoming the quotation 96¾ and 96¾ and the settlement of the Consol account on Thursday tend to improve prices. Money was tolerably easy for the purpose of closing accounts, and the Bank was too plentiful to suit the parties for the like. The unfunded debt is also somewhat lower this week. In Reduced and New Three-and-a-Quarters the public have been buyers. At the close of business the market was quiet, the following quotations being the last registered:—Bank Stock, 210; Reduced, 97¾; Consols, 96¾; New 3½ per Cent. Annu., 98¾; Long Annu., to expire Jan., 1860, 17¾; India Stock, 263½. India Bonds, £1000, £3 3s.; Consols for Account, 97¼. Exchequer bills, £1000, 49 p.; £500, 49 p.; Small, 49 p.

Monday was the first settling day to Sardinian scrip, and, notwithstanding the wide fluctuations that have taken place, no defaulter has announced. The Spanish market is very heavy, and Mexican is weak from unfavourable accounts. Portuguese is also lower. Turkish securities are steady, quiet, and unchanged. The affair of much difficulty. Spanish five per Cents improved on the receipt of the following note, telegraphed from Madrid to the Chamber had at Madrid:—"Bravo Murillo's scheme for the settlement of the debt. The Five per Cents were quoted at 21½ on Thursday, however, the market took its first decline on Friday, and on Saturday the military revolt in Madrid caused a further depression of about 1 per cent. [illegible] Portuguese is also lower. Turkish securities are steady, quiet, and unchanged. The affair of much difficulty. Spanish five per Cents improved on the receipt of the following note, telegraphed from Madrid to the Chamber had at Madrid:—"Bravo Murillo's scheme for the settlement of the debt. The Five per Cents were quoted at 21½ on Thursday, however, the market took its first decline on Friday, and on Saturday the military revolt in Madrid caused a further depression of about 1 per cent. [illegible]

The following are the closing prices:—Spanish Passive, 4½; Ditto Certificates, 4½; Portuguese, Four per Cent., 31½; Russian Bonds, Four-and-a-Half per Cent., 100; Austrian Metal. Bonds, 5; Ditto, Five per Cents., 1845, 5; Ditto Account, 21; Ditto Passive, 6; Ditto, Three per Cent., 28; Venezuela Bonds, Two-and-a-Quarter per Cent., Account, 32, Belgian Four-and-a-Half per Cent., 93; Belgium Five per Cents., 102; Dutch Two-and-a-Half per Cent., 60; Ditto, ready, for Cent., 60.

ORDINARY SHARES AND STOCKS.—Aberdeen, 10; Ambergate, Nottingham, Boston, and Eastern Junction, 4; Chester and Holyhead, 10; East Anglian (£25, l. and 6) 2; Great Northern, 17; Great Southern and Western (Ireland), 38; Great Western, 83; Lancashire and Yorkshire, 48. Ditto, Dividend, 3. Leeds and Thirsk, 11. Lincoln and Hobbter, 3. London and North-Western, 103; Ditto Quarter Shares, 25. Manchester, Sheffield, and Lincolnshire, 32; Ditto, Extension, 10. Midland, 69; Ditto, Scrip, 1. North Staffordshire, 8. Oxford, Worcester, and Wolverhampton, 20. Shrewsbury and Birmingham, 16. South-Eastern and Dover, 10. South-Western, 80. Ditto, New, 10. York, Newcastle, and Berwick, 18; Ditto, Extension, 3. York and North Midland, 15.

PREFERENCE AND FIXED SHARES AND STOCKS.—Caledonian, 10; Eastern Counties, 1; Great Northern, 13; North British, 5.

PREFERENCE SHARES.—Eastern Counties Extension, New Six per Cent., 10; Great Northern, 13; North British, 5.

FOREIGN AND COLONIAL.—Buenos Ayres, 74; Ditto, Deferred, 33; Chilian, 6 to 6½; Ditto, Deferred, 2; Northern of France, 14; Ditto, 15.

THE MARKETS.

CORN EXCHANGE.—Since our last, the arrivals of English wheat to the port of London, as well as by land carriage and sample, have been on a very limited scale. For all kinds the demand has been steady, at full prices. The foreign supplies have come in but sparingly, and the sale of the same has been tolerably steady, at full prices. Fine foreign wheat is now in good demand, speedily at late rates. Barley and malting qualities have remained of very little account. No English malt, for the season, has come forward, but the imports from abroad are liberal. For most kinds the demand has ruled inactive, at previous quotations. Malt has sold slowly in retail, at last week's currencies. Beans have met a ready sale, at full prices. Peas have tended to improve in value. Beans have sold at a similar description. In peas and [illegible] there has been nothing doing. [illegible] has been transacted in [illegible] at [illegible] Wheat, Essex and Kent, red, 35s to 39s; ditto, white, 37s to 41s; Norfolk and Lincolnshire, red, 34s to 38s; ditto, white, 36s to 40s; Scotch and Irish, 32s to 36s; rye, 30s to 32s; grinding barley, 24s to 26s; distilling ditto, 26s to 28s; malting ditto, 30s to 34s; Kingston and Ware, 50s to 56s; Chevalier, 54s to 60s; harvester, 44s to 48s; Scotch and Irish, 38s to 42s; malt, pale, 60s to 66s; brown, 56s to 60s; beans, [illegible] 32s to 34s; ditto, [illegible] 34s to 36s; pigeon, 36s to 38s; [illegible] 34s to 36s; [illegible] 32s to 34s; [illegible] 30s to 32s; oats, Yorkshire, 22s to 24s; potato, 24s to 26s; Lincolnshire and Yorkshire, 23s to 25s; Scotch, 22s to 24s; Irish, 20s to 22s; flour, 40s to 42s per sack.

BOROUGH MARKET.—A few parcels of new carraway have been offered at 42s per quarter. In other seeds as well as canary, no change has occurred, but the quotations are somewhat nominal. Linseed cakes, English, 9l to 9l 10s; Mediterranean and Baltic, 8l to 8l 5s. Rapeseed, 37s to 38s per quarter. Coriander, 16s to 18s per cwt. Canary, 40s to 44s per quarter. English clover seed, red, 30s to 34s; white, 40s to 44s. Foreign, red, 28s to 32s; white, 36s to 40s per barrel. Canada, 40s to 44s per barrel. Tares, 3s to 3s 6d per bushel.

Provision Market.—A few parcels of new ca

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS

No. 503.—VOL. XIX.] SATURDAY, JULY 19, 1851. {TWO NUMBERS, 1s. WITH HALF-SHEET SUPPLEMENT, GRATIS.

THE GREAT EXHIBITION.

AGRICULTURAL IMPLEMENTS.

THIS being the week of the Great Agricultural Show at Windsor, we present our readers with several Illustrations of the most notable and novel implements in the Exhibition. We commence the series with—

AMERICAN REAPING MACHINE.

This machine continues to excite considerable interest among agriculturists and their machinists; and it is seldom that two or three farmers, and often farm labourers, are not to be found examining the details of its construction, and speculating upon its success in effecting the desired object.

Rude attempts at reaping machines were made by the Romans, and numerous ingenious contrivances have been introduced at various times since, both in Great Britain and on the Continent; but at the present time there is not one in ordinary use in England. The general fault of the machines hitherto constructed is that they will only cut the corn when it is in first-rate condition, the straw being erect, and the ground exceedingly even.

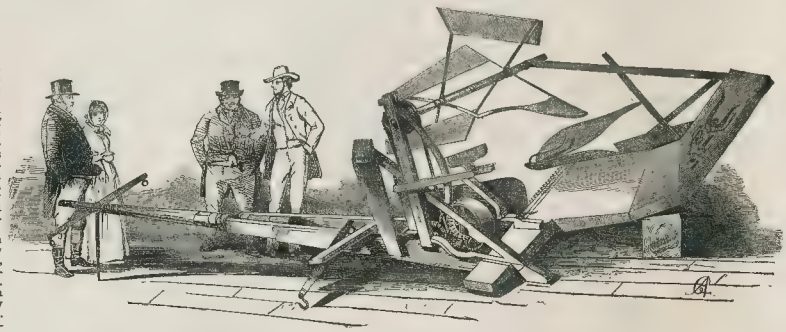
Two methods have been adopted in the various attempts at reaping machines—the one to cut by a series of clippers or shears, and the other by a revolving plate. The latter plan was adopted by the late Mr. Smith, of Deanston, in 1811, and was improved and used until about as late as 1837, but has now entirely disappeared. The machine that has been the most successful was the invention of the Rev. Patrick Bell, of Carnigile, Forfarshire, and a premium was awarded him by the Agricultural Society of Scotland in 1827. It cut a breadth of five feet, and did its work exceedingly well; but, from the defects before alluded to, it has not come into general use.

As some trials are to be shortly made with the American implement, it would be unwise to give any opinion now as to the merits of this machine; we shall, therefore, merely describe it, and shall hereafter discuss its operation, when we have the results of the trials to guide us.

The subject of the present Engraving is the invention of C. H. M'Kormick, Esq., of Chicago, who has already received the gold medal of the American Institute for it. The principle of the cutting action is shown in the diagram, and consists of a cutting blade about an inch in breadth, slightly toothed on the front edge, and extending the whole length of the breast of the machine, a quick reciprocating motion being given to this by a crank. The straw, as the machine moves round, passes into the space between the projecting fingers, and is sawn off by the action of the cutter. Directly over the cutting-blade is a light reel, with flat transverse blades of deal, set at a slight angle with the front of the machine, revolving as it moves round, and holding the straw firmly between the fingers and against the blade while being cut. This reel seems to us to be the most objectionable part of the machine, as it will be likely to knock out the grain from the ears as the transverse spars strike them on descending, though the blow is much lessened by their being placed spirally upon the reel. When the corn is cut, it falls upon the floor of the machine, and is removed to the land again by a man who sits on a saddle-shaped piece of the machine and is carried forward with it.

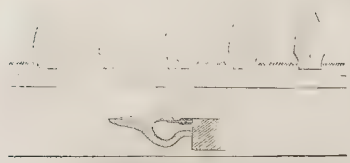
The machine seems to have answered exceedingly well in America, to judge from the enormous number of them the makers are said to have sent out.

We copy the following description of its extraordinary cutting powers from an American paper devoted to agricultural subjects, called the *Cultivator*:—"The machine cuts all the grain; and if the raker is careful, none is scattered; and if the binders carry a rake and use it, none need be lost. Fields harvested by these machines have a beautiful appearance. The stubble is uniform in height, while no prostrate, scattering straws



AMERICAN REAPING MACHINE.

RNSBY'S PORTABLE STEAM-ENGINE AND THRESHING MACHINE.—(SEE NEXT PAGE.)



CUTTING KNIFE OF AMERICAN REAPING MACHINE.

speak of waste. If the binders have felt at all interested in doing their work well, there is nothing to glean with the sickle, bagging-hook, or rake. Weeds, brush, pitchforks, rakes, if standing in the way, or even horses' legs, are all cut smooth alike."

HORNSBY'S PORTABLE STEAM-ENGINE AND THRESHING MACHINE.

It has become the practice of many agricultural implement makers to devote their whole energy and skill to the perfecting of one or two particular implements or machines; hence, we now find one firm celebrated for ploughs, another for chaff-cutters, another for drills, &c.; and the excellent results of this practice are especially observable in the case of the portable steam-engine of Messrs. Hornsby.

This eminent firm have paid great attention to the construction of portable steam-engines, and have been the winners of many prizes in contests for superiority with other makers. Last year, and we believe on a previous occasion, they gained the first prize from the Royal Agricultural Society of England; and it is not unlikely they will again carry it off at the Great Exhibition of 1851.

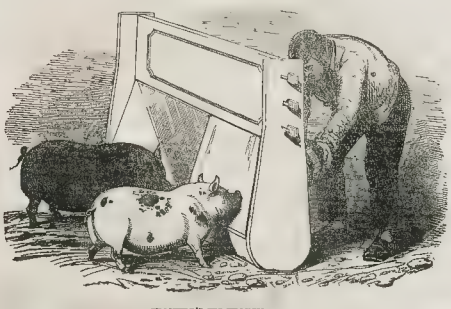
The most remarkable feature in this engine is the placing the cylinder in the steam-chest, where it is kept hot, and all waste of heat prevented; and, at the same time, it is so arranged that the cylinder may be got at with ease when necessary, for repair, &c.

The workmanship of this machine is highly creditable to the Messrs. Hornsby, there being nothing, perhaps, in this department superior to it; and the details exhibit the result of great study to produce the best possible result in the best possible manner.

We have engraved the engine as it is used in threshing in the open field, with one of the excellent threshing-machines made by the same firm.

CROSSKILL'S PIG-TROUGH.

This is an excellent contrivance for supplying food to hogs. The ordinary method is to empty the wash into open troughs, to which the pigs have at all times access. The consequence is, that on the arrival of the meal a general scuffle takes place among the animals, and in their greedy anxiety to get more than their proper share, a considerable quantity of the food is wasted by being splashed over, especially during the time the feeder is filling the troughs. Mr. Crosskill's object is to avoid this unnecessary waste, by constructing the trough in such a manner that the hogs have no access to it, until it has been carefully and properly filled. To effect this, a movable spring flap is suspended above the trough, and which is placed against the side next the hogs while it is being filled. When this is done, it is drawn to the opposite side, and then forms a proper back to the trough, and prevents any waste from splashing, &c. In our engraving we have shown one half the flap in its position while being filled, and the other, as when the hogs are feeding.



CROSSKILL'S PIG-TROUGH.

MESSRS. HOWARD'S PATENT PLOUGHS.

Messrs. Howard's new patent ploughs are made principally of wrought iron, and are an improved form of their prize ploughs, which are known throughout the kingdom; the Royal Agricultural Society of England, having, since 1841, awarded to Messrs. Howard nine first prizes for exhibiting the best plough at their annual meetings. The exhibitors show a set of ploughs of three sizes, marked for distinction XXX, and XXX, suitable for ordinary, deep, and extra deep ploughing. The improvements consist in a greater elegance of design, more equal proportions, and the cutting and moving parts known as the share and furrow-turner being formed upon exact geometrical principles The curve being regular and taper, the power required to work the implement is considerably lessened; and the furrow slice travelling at an uniform rate from its being first cut until left in its final position, the furrows are laid more even, and in the best form for the reception of the seed. A novel method is introduced of fixing the shares to lever necks of wrought iron, the raising or lowering of which gives the point greater or less inclination as the state of the land may require. The action and fixing of this lever neck is most simple, and altogether new. The centre pin, upon which the lever works, is of steel, and fixed to the neck; the lever when raised or lowered (which can be done instantly) is secured in a series of grooves by a screw-nut at the end of it: the iron being thus brought into a state of tension, ensures firmness, as well as increases the strength. Another feature in these ploughs is a new mode of fixing the wheels and making the axles. The holdfasts, or clamps, securing the wheels, are made to slide through a mortise formed in the beam, by which the width may be altered with greater facility, as well as dispensing with the old sliding axle, which was an obstacle in deep ploughing, and objectionable upon dirty land on account of the soil accumulating round it; the wheels, by the method now adopted, are brought opposite to each other, and the land-wheel may be expanded as well as the furrow-wheel. The axles are similar to a patent axle—an essential improvement, as no grit can get in nor any grease escape; the wheels, therefore, must wear much longer, and the friction is considerably reduced. A most simple method of adjusting the coulter is adopted, by which any required position is instantly obtained, thus preventing much loss of time, which was the case upon the old plan of fastening by wedges. The draught, as will be seen from the illustration, is from the nearest point to the centre of resistance, thereby removing a great portion of strain on the beam.

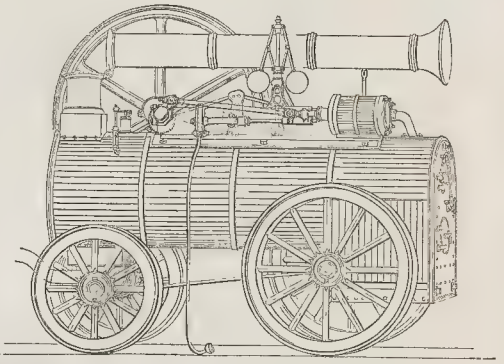
Every part is so arranged, that a ploughman can remove or replace the irons, subject to wear or breaking in the field, without the assistance of a mechanic; and they can be worked either with or without wheels, or with one, as required, and each plough is furnished with a set of furrow-turners of various sizes, more or less curved.

HOWARD'S PATENT PLOUGH.

BARRETT AND EXHALL'S STEAM-ENGINE.

We have before alluded to the first-rate workmanship of the articles exhibited by Barrett, Exhall, and Co., of Reading, and this is especially observable in the excellent specimen of a portable steam-engine exhibited by them.

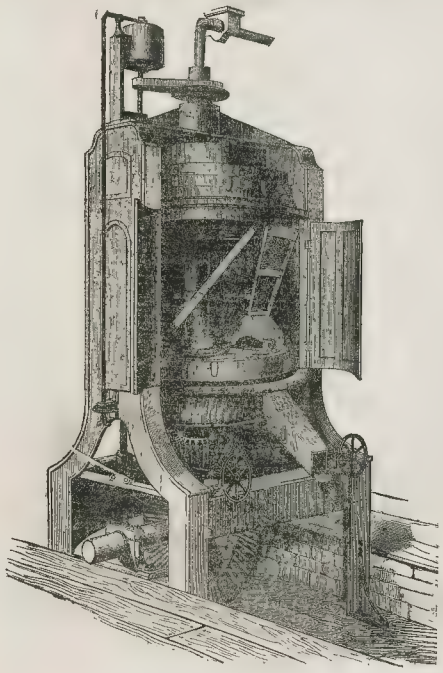
A striking peculiarity of this engine is the placing the cylinder and the whole of the engine part upon a metal frame, which is complete in itself, independent of its attachment to the boiler, and renders its removal easy at any time it may be necessary, without affecting the other part, and a much steadier action is also produced while working. This engine is well adapted for all purposes connected with agriculture, as well as sawing, pumping, &c.; and, as its consumption of coal is not more than 7 lb. per horse-power per hour, and any smart man on the farm may, with a month's practice, be safely entrusted to work it, there can be no question about the economy of using them.



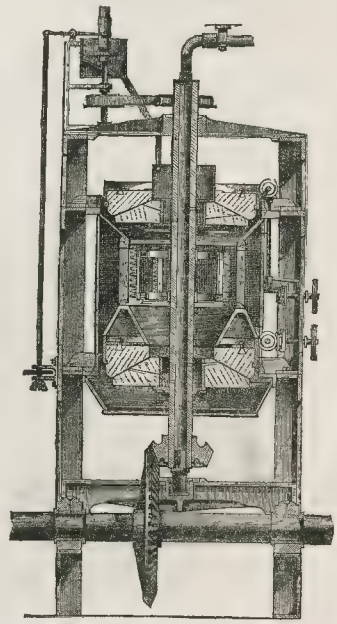
BARRETT AND EXHALL'S STEAM-ENGINE.

WESTRUP'S PATENT CONICAL FLOUR MILL.

In presenting our readers with the subjoined plan of Westrup's Patent Conical Flour Mill, we think it necessary to remark, that for the last three centuries our best mechanical millwrights and engineers have been seeking some better method of grinding wheat than by the use of the antiquated horizontal mill-stones. These stones are most of them from four to five feet in diameter; and wheat passing between them, in the operation of being ground into meal, is subject to such an amount of heat by pressure and friction, as to extract from it by evaporation a very considerable portion of its nutritious qualities: the stones being horizontal, the delivery of the meal from them after grinding can only be effected by the extreme velocity with which the upper stone revolves. Under the disadvantageous circumstances in which our older millers have worked for so many years, we cannot but hail an invention, as effective as it is simple, which completely provides against the evils which the old system is subject to. The improvement we refer to is the adoption of conical stones in lieu of horizontal ones, with a working surface of only eight inches instead of two feet. By the first pair of stones the wheat is broken and delivered in a state of half-ground meal, unheated; and, by the natural laws of gravity, the flour is instantly passed through a wire cylinder, fixed beneath, by the aid of brushes fixed upon the same shaft as the stones. The flour being thus instantly separated from the unground meal, the latter passes down to the second pair of stones also fixed upon the same shaft, and the grinding is then completed. Moreover, we cannot refrain from expressing our admiration of the concise and beautiful adjustment of the stones, as being on a good sound principle. The lower, or running stones, are keyed upon the shaft, whilst the upper or stationary stones drop into a turned ring, and necessarily rise and fall upon four inclined

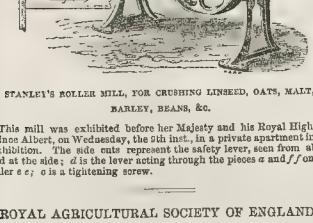


WESTRUP'S PATENT CONICAL FLOUR MILL.



WESTRUP'S PATENT CONICAL FLOUR MILL (SECTION).

planes, and are capable of regulation to the utmost nicety, thereby wholly relieving the wheat from any weight or undue pressure during the operation of grinding, whilst the weight upon the old system is equal to three-quarters of a ton. Another feature of paramount importance is, that the conical mill can be driven by less power than is required to drive the horizontal ones, the former producing double the quantity of work in the same period of time. We have perused certificates from several respectable bakers who have used the flour produced by this method, which state that a sack of flour manufactured by the conical mill will produce from two to three 4-lb. loaves more than that which is made by any other mode of manufacture yet introduced, and they attribute this increase to the greater quantity of gluten and nutritious qualities retained in the flour from its being so much less heated, the wheat passing over such a small surface of stone. These data, which have been most satisfactorily established, induced us to calculate the advantages that might be derived were this improved method of manufacture to be generally adopted. Taking the population of London to be 2,500,000, and inferring that each person consumes annually, according to the last statistics, the produce of a quarter of wheat, which is about 332lb. of flour, and that this mode of grinding will produce three 4-lb. loaves more to the sack than the old method, there will be for London alone a gain of 10,233,142 4-lb. loaves from the same quantity of wheat. Again, taking the population of England at 20,000,000, and valuing the 4-lb. loaf at sixpence, and calculating upon the increase of three loaves to the sack, there will be a gain to the country at large of the enormous amount of £3,646,428 per annum—a sum about equal to half the Income-tax as at present levied.



STANLEY'S ROLLER MILL, FOR CRUSHING LINSEED, OATS, MALT, BARLEY, BEANS, &c.

This mill was exhibited before her Majesty and his Royal Highness Prince Albert, on Wednesday, the 9th inst., in a private apartment in the Exhibition. The side rods represent the safety lever, seen from above and at the side; *d* is the lever acting through the pieces *a* and *f f* on the roller *e e*; *o* is a tightening screw.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEETING AT WINDSOR, 1851.

The following is a list of the Judges' awards on the different kinds of stock:—

SHORT-HORNS

Class 1.—Bulls calved previously to the 1st of January, 1849.

First prize of £40, No. 36, to Mr. Thomas Wetherell, of Kirkbridge, near Darlington, York, a 4 years and 9 months old short-horned bull, bred by Mr. Henry Lister Maw, of Tetley, near Crowle, Lincolnshire.

Second prize of £20, No. 6, to the Right Hon. Lord Hastings, of Melton Constable, near Thetford, Norfolk, a 6 years and 1 month old short-horned bull, bred by his Lordship.

Class 2.—Bulls calved since the 1st of January, 1849.

First prize of £25, No. 47, to Mr. John Kirkham, of Hagnaby, near Spilsby, Lincolnshire, a 2 years 4 months and 8 days old short-horned bull, bred by himself.

Second prize of £15, No. 53, to Mr. Thomas Raine, of Gainford, near Darlington, a 2 years and 3 months old short-horned bull, bred by himself.

Third prize of £10, No. 70, to Mr. Thomas Bentley, of Pannal Hall, Pannal, near Wetherby, Yorkshire, a 1 year and 10½ months old short-horned bull, bred by Mr. F. H. Fawkes, of Farnley Hall, near Otley.

Class 3.—Cows in milk or in calf.

First prize of £20, No. 97, to Mr. Richard Booth, of Warlaby, near Northallerton, Yorkshire, a 4 years and 4 months old short-horned cow, in calf and in milk, bred by him-self.

Second prize of £10, No. 110, to the Right Hon. Viscount Hill, of Hawkstone, Shrewsbury, Salop, a 6 years 1 month and 24 days old short-horned cow in milk, bred by his Lordship.

Class 4.—In-calf Heifers not exceeding three years old.

First prize of £20, No. 122, to Mr. Charles Towneley, of Towneley Park, near Burnley, Lancaster, a 2 years and 2 months old pure short-horned in-calf heifer, bred by himself.

Second prize of £15, No. 124, to Mr. Charles Towneley, of Towneley Park, near Burnley, Lancaster, a 2 years and 9 months old pure short-horned in-calf heifer, bred by Mr. Richard Eastwood, of Swinshow, near Burnley.

Third prize of £10, No. 130, to Mr. James Douglas, of Athelstaneford, New Mains, near Drem, Haddington, a 2 years and 1 month old short-horned in-calf heifer, bred by Mr. Turner, of Kilcullen.

Class 5.—Yearling Heifers.

First prize of £15, No. 162, to the Right Hon. Viscount Hill, of Hawkstone, near Shrewsbury, a 1 year 10 months and 16 days old short-horned heifer, bred by his Lordship.

Second prize of £10, No. 156, to Mr. Henry Ambler, of Watkinson Hall, near Halifax, Yorkshire, a 1 year and 6 months old short-horned heifer, bred by himself.

Third prize of £5, No. 163, to the Right Hon. Viscount Hill, of Hawkstone, near Shrewsbury, a 1 year 10 months and 23 days old short-horned heifer, bred by his Lordship.

HEREFORD.

Class 1.—Bulls calved previously to the 1st of January, 1849.

First prize of £40, No. 177, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury, a 4 years 6 months and 23 days old Hereford bull, bred by Mr. T. Longmore, of Watford.

Second prize of £20, No. 178, to Mr. Edward Price, of the Court-house, Pembridge, near Leominster, Hereford, a 3 years and 20 days old Hereford bull, bred by himself.

Class 2.—Bulls calved since the 1st of January, 1849.

First prize of £25, No. 189, to Mr. F. R. Price, of Huntington, near Hereford, a 1 year and 10 months old Hereford bull, bred by the late Mr. John Jones, of Lower Breinton, near Hereford.

Second prize of £15, No. 188, to Mr. Sylvanus Archibald, of Holmer, near Hereford, a 1 year and 10 months old Hereford bull, bred by himself.

Third prize of £10, No. 191, to Mr. John Monkhouse, of the Stow, near Hereford, a 1 year and 10½ months old Hereford bull, bred by himself.

Class 3.—Cows in Milk or in Calf.

First prize of £20, No. 196, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury, a 3 year 8 months and 19 days old in-calf Hereford heifer, bred by his Lordship.

Second prize of £10, No. 197, to the Rev. John Robert Smythies, of East-hill, near Colchester, Essex, a 4 years and 6 months old true Hereford cow, in milk, bred by Mr. Samuel Aston, of Lynch Court, near Leominster.

Class 4.—In-calf Heifers.

First prize of £20, No. 202, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury, a 2 year 8 months and 19 days old in-calf Hereford heifer, bred by his Lordship.

Second prize of £15, No. 203, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury, a 2 years 7 months and 14 days old in-calf Hereford heifer, bred by his Lordship.

Third prize of £10, No. 206, to Mr. Philip Turner, of the Leen, Pembridge, near Leominster, Hereford, a 2 years and 9 months old in-calf Hereford heifer, bred by himself.

Class 5.—Yearling Heifers.

First prize of £15, No. 215, to Mr. Fowler B. Price, of Huntington, near Hereford, a 1 year and 9 months old Hereford yearling heifer, bred by Mr. J. N. Carpenter, of Eardisland, near Leominster

Second prize of £10, No. 209, to Mr Walter Maybery, of Penlan, near Brecon, 1 year and 8 months old Hereford yearling heifer, bred by himself.

Third prize of £5, No. 210, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury, a 1 year 7 months and 16 days old Hereford yearling heifer, bred by his Lordship.

DEVONS.

Class 1.—Bulls calved previously to the 1st January, 1849.

First prize of £40, No. 226, to Mr. John Quartley, of Champson Molland, near South Molton, Devon, a 3 years and 5 months old North Devon bull, bred by himself.

Second prize of £20, No. 219, to Mr. James Davy, of North Molton, near South Molton, Devon, a 5 years and 10 weeks old pure Devon bull, bred by himself.

Class 2.—Bulls calved since the 1st of January, 1849.

First prize of £25, No. 229, to Mr. Samuel Farthing, of Stowey Court, near Bridgewater, Somerset, a 2 years and 6 months old Devon bull, bred by himself.

Second prize of £15, No. 237, to Mr. Thomas Miller, of Castle Farm, near Sherborne, Dorset, a 2 years and 4 months old Devon bull, bred by himself.

Third prize of £10, No. 228, to Mr. Thomas Bond, of Bishop's Lydeard, near Taunton, Somerset, a 2 years and 6 months old Devon bull, bred by himself.

Class 3.—Cows in milk or in calf.

First prize of £20, No. 244, to Mr. George Turner, of Barton, near Exeter, Devon, a 5 years and 7 months old pure North Devon cow, in milk and in calf, bred by the late Mr. Tremlett, of Cheriton, Devon.

Second prize of £10. No. 239, to Mr. Frederick Hogg, of 40, St. James's-street, London, a 7 years and 3 months old pure Devon cow, in milk, bred by Mr. Matthew Paull, of Burstock Grange, near Broadwinsor, Dorset.

Class 4.—In-calf Heifers, not exceeding three years old.

First prize of £20, No. 261, to Mr. George Turner, of Barton, near Exeter, Devon, a 2 years and 3 months old in calf pure North Devon heifer, bred by himself.

Second prize of £15, No. 262, to Mr. George Turner, of Barton, near Exeter, Devon, a 2 years and 6 months old in-calf pure North Devon heifer, bred by himself.

Third prize of £10, No. 265, to the Right Hon. the Earl of Leicester, of Holkham Hall, near Wells-next-the-Sea, Norfolk, a 2 years and 9 months old in calf pure North Devon heifer, bred by Lord Portman, of Bryanston, near Blandford, Dorset.

Class 5.—Yearling Heifers.

First prize of £15, No. 284, to Mr. William M. Gibbs, of Bishop's Lydeard, near Taunton, Somerset, a 1 year and 9 months old Devon yearling heifer, bred by himself.

Second prize of £10, No. 291, to Mr. John Quartly, of Champson Molland, near South Molton, Devon, a 1 year and 5 months old North Devon yearling heifer, bred by himself

Third prize of £5, No. 279, to Mr. George Turner, of Barton, near Exeter, Devon, a 1 year and 7 months old pure North Devon yearling heifer, bred by himself.

LONG HORNS.

Class 1.—Bull calved previously to Jan. 1, 1849.

In this class the first prize of £10 was withheld, on account of insufficient merit.

Class 2. —Bull calved since Jan. 1, 1849.

Prize of £10, No 293, to Mr Richard H Chapman, of Upton, near Atherstone, Warwick, a 2 years and 4½ months old long-horned bull, bred by himself.

Class 3.—Cows in Milk or in Calf.

Prize of £10, No 294, to Mr. Thomas Beards, of Stowe, Buckingham, a 4 years and 11 months old long-horned cow, in milk, bred by himself.

Class 4.—In-calf Heifer, not exceeding three years old.

Prize of £5, No. 296, to Mr. Thomas Beards, of Stowe, Buckingham, a 2 years and 0 months old long-horned heifer, bred by himself.

Class 5.—Yearling Heifers.

Prize of £5, No. 297, Mr. Thomas Beards, of Stowe, Buckingham, a 1 year and 8 months old long-horned heifer, bred by himself.

CHANNEL ISLANDS.

Class 1.—Bulls calved previously to the 1st of January, 1849.

Prize of £10, No. 302, to the Right Hon. the Earl of Egmont, of Cowdray, near Petworth, Sussex, a 3 years and 13 days old Channel Islands bull, bred by his Lordship.

Class 2.—Bulls calved since the 1st of January, 1849

Prize of £10, No. 318, to Mr. John Gregory Watkins, of Woodsfield, Worcester, a 2 years and 4 months old Channel Islands bull, bred by himself.

Class 3 —Cows in Milk or in Calf.

Prize of £10, No. 313, to Mr. George Toroda, of The Forest, Guernsey, a 3 years and 6 months old pure Guernsey cow, in calf, bred by Le Page, St. Martin's, Guernsey.

Class 4 —In-calf Heifers.

Prize of £5. No. 321, to Sir John Caldcart, of Cooper's Hill, Chertsey, Surrey, a 2 years old Alderney in-calf heifer, breeder unknown.

Class 5.—Yearling Heifers.

Prize of £5, No. 327, Mr. Henry Chapman, of Wraysbury, near Staines, Bucks, a 1 year and 8 months old Alderney yearling heifer, bred by Mr. W. Levi, of Houghton on the Green, Newport Pagnel, Bucks.

SUSSEX.

Class 1 Bulls calved previously to the 1st of January, 1849.

Prize of £10, No. 332, to Mr. Henry Catt, of West Firle, near Lewes, Sussex, a 3 years and 5 months old Sussex bull, bred by himself.

Class 2.—Bulls calved since the 1st of January, 1849.

Prize of £10, No. 339, to Mr. John Waters. of Woocumbe, near Eastbourne, Sussex, a 1 year and 3 months old Sussex bull, bred by Mr. James Gorringe, of Selmeston, Sussex.

Class 3.—Cows in Milk or in Calf.

Prize of £10, No. 341, to Mr. Thomas Child, of Michelham, near Hailsham, Sussex, a 6 years and 5 months old Sussex cow, in milk, bred by himself.

Class 4.—In calf Heifers.

Prize of £5, No. 346, to Mr. William Marshall, of Bolney-place, near Cuckfield, Sussex, a 2 years and 3 months old Sussex in-calf heifer, bred by himself.

Class 5. - Yearling Heifers.

Prize of £5, No. 350, to Mr. William Marshall, of Bolney-place, near Cuckfield, Sussex, a 1 year and 5 months old yearling heifer, bred by himself.

SCOTCH HORNED.

Class 2 —Bulls calved since the 1st of January, 1849. One year old.

Prize of £10, No. 352, to Mr. Charles Fielder, of Sparshott, near Winchester, Southampton, a 1 year 3 months and 13 days old pure Ayrshire bull, bred by Mr. David Glen, of Fletchwood Farm, Eling, near Southampton.

Class 3.—Cows in Milk or in Calf.

Prize of £10, No 358, to Sir John Cathcart, of Cooper's-hill, near Chertsey, Surrey, a 6 years old Ayrshire cow, in milk; breeder unknown.

SCOTCH POLLED.

Class 1.—Bull calved previously to the 1st of January, 1849.

Prize of £10, No. 361, to Mr. William M'Combie, of Tillyfour, near Alford, Aberdeen, a 5 years and 2 months old Angus polled bull, bred by Mr. Hugh Watson, of Keillor.

Class 3. —Cows in Milk or in Calf.

Prize of £10, No. 364, to Mr. Robert Scott, of Balwylie, near Montrose, Forfar, a 7 years and 6 months old pure Aberdeenshire cow, in calf, bred by Mr. William M'Combie, of Thilyfour.

Class 4.—In-calf Heifers.

Prize of £5, No. 366, to Mr. William M'Combie, of Tillyfour, near Alford, Aberdeen, a 2 years and 5 months old Angus polled in-calf heifer, bred by himself.

Class 5.—Yearling Heifers.

Prize of £5, No. 368, to Mr. William M'Combie, of Tillyfour, near Alford, Aberdeen, a 1 year and 5 months old Angus polled yearling heifer, bred by himself.

WELSH, IRISH, &c.

Class 1.—Bulls calved previously to the 1st of January, 1849.

Prize of £10, No. 372, to Lieut.-General Sir Edward Kerrison, Bart., of Oakley Park, near Eye, Suffolk, a 4 years and 1 month old Suffolk bull, bred by himself.

Class 2 —Bulls calved since the 1st of January, 1849.

Prize of £10, No 376, to Mr. George David Badnam, of Thurlston, near Ipswich, a two years and 5 months old Suffolk bull, bred by himself.

Class 3.—Cows in Milk or in Calf.

Prize of £10, No. 379, to Lieut.-General Sir Edward Kerrison, Bart., of Oakley Park, near Eye, Suffolk, a 3 years and 11 months old Suffolk cow, in calf, bred by himself.

Class 4.—In-calf Heifers.

Prize of £5, No. 383, to Lieut.-General Sir Edward Kerrison, Bart., of Oakley Park, near Eye, Suffolk, a 2 years and 11 months old Suffolk heifer, in calf, bred by himself.

Class 5.—Yearling Heifers.

Prize of £5, No. 384, to Mr. George D. Badnam, of Thurlston, near Ipswich, Suffolk, a 1 year and 11 months old Suffolk yearling heifer, bred by himself.

HORSES.

Class 1.—Stallions of any age, for Agricultural Purposes.

First prize of £30, No. 407, to Mr. Thomas Catlin, of Batley, near Woodbridge, Suffolk, a 5 years old pure Suffolk stallion, bred by himself.

Second prize of £15, No. 406, to Mr. Thomas Catlin, of Batley, near Woodbridge, Suffolk, a 9 years old pure Suffolk stallion, bred by himself.

Class 2 —Two-year-old Stallions for Agricultural Purposes.

First prize of £20, No. 420, to Mr. Frederick Thomas Bryan, of Knessington, near Oakham, Rutlandshire, a 2 years old cart stallion, bred by Mr. William Wright, of Stonesby, Leicestershire.

Second prize of £15, No. 434, to Mr. Henry Taylor, of Bishopstone, near Farringdon, Berkshire, a 2 years old cart stallion, bred by himself.

Third prize of £10, No. 417, Mr. Samuel Clayden, of Little Linton, near Linton, Cambridge, a 2 years old Suffolk stallion, bred by himself.

Class 3.—Dray Stallions.

Prize of £20, No. 439, to Mr. Robert Brown, of Farleigh Wallop, near Basingstoke, Hants, a 6 years old dray stallion, bred by himself,

Class 4.—Hunter Stallions.

Prize of £30, No. 449, to Mr. Thomas Groves, of Manor House, Nunmonkton, near York, a 5 years old thorough-blood hunter stallion, bred by Mr. Molckiam, London.

Class 5 —Carriage Stallions.

Prize of £30, No. 467, to Mr. Thomas Holtby, of Brandesburton, near Beverley, Yorkshire, a five years old coach stallion, bred by Mr. Whiting, of Hempholme.

Class 6.—Roadster Stallions.

Prize of £15, No. 472, to Mr. Thomas Groves, of Manor House, Nunmonkton, Yorkshire, a 6 years old pure roadster stallion, bred by Captain Viner, of Newly Hall, near Ripon, or one of his tenants.

Class 7.—Mares and Foals.

First prize of £20, No. 484, to Mr. John George Sheppard, of the High House, Campsey Ash, near Woodbridge, Suffolk, a Suffolk mare and foal, the mare bred by himself; sire of foal belonged to Mr. Nathaniel G. Barthropp, of Cretingham, near Framlingham.

Second prize of £15, No. 483, to Mr. John Smith, of Crownthorpe, near Wymondham, Norfolk, a Norfolk mare and foal; the mare bred by himself; sire of foal belonged to Mr. Cordy, of Shipdham.

Third prize of £5, No. 493, to William Thompson, of Thorpe-le-Soken, near Colchester, a Suffolk mare and foal; breeder of mare unknown; sire of foal belonged to himself.

Class 8.—Two-year-old Fillies.

First prize of £20, No. 502, to Mr. Nathaniel George Barthropp, of Cretingham Rookery, near Woodbridge, Suffolk, a 2 years old Suffolk filly, bred by Mr. Read, of Laxfield.

Second prize of £15, No. 497, to Mr. Thomas Beale Browne, of Hampen, near Andoverford, Gloucester, a 2 years old Suffolk filly, bred by himself.

Third prize of £5, No. 499, to the Right Hon. Lord St. John, of Mecabourne, near Higham Ferrers, Beds, a 2 years old cart filly, bred by his Lordship.

LEICESTERS.

Class 1.—Shearling Rams.

First prize of £35, No. 520, to Mr. William Sanday, of Holme Pierrepont, near Nottingham, a 17 months old Leicester ram, bred by himself.

Second prize of £20, No. 521, to Mr. William Sanday, of Holme Pierrepont, near Nottingham, a 17 months old Leicester ram, bred by himself.

Third prize of £10, No. 518, to Mr. William Sanday, of Holme Pierrepont, near Nottingham, a 17 months old Leicester ram, bred by himself.

Class 2.—Rams of any other age.

First prize of £30, No. 578, to Mr. Thomas Edward Pawlett, of Beeston, near Biggleswade, Beds, a 28 months old Leicester ram, bred by himself.

Second prize of £23, No. 580, to Mr. Thomas Edward Pawlett, of Beeston, near Biggleswade, Beds, a 40 months old Leicester ram, bred by himself.

Third prize of £10, No. 581, to Mr. Thomas Edward Pawlett, of Beeston, near Biggleswade, Beds, a 40 months old Leicester ram, bred by himself.

Class 3 —Shearling Ewes

First prize of £20, No. 634, to Mr. William Sanday, of Holme Pierrepont, Notts, a pen of five 17 months old Leicester shearling ewes, bred by himself.

Second prize of £10, No. 636, to Mr. William Abraham, of Barnetby-le-Wold, near Brigg, Lincoln, a pen of five 16 months old Leicester shearling ewes, bred by himself.

Third prize of £5, No. 632, to Mr. William Sanday, of Holme Pierrepont, Notts, a pen of five 16 months old Leicester shearling ewes, bred by himself.

SOUTH DOWNS.

Class 1.—Shearling Rams.

First prize of £35, No. 681, to Mr. Jonas Webb, of Babraham, near Cambridge, a Southdown ram, 17 months old, bred by himself.

Second prize of £20, No. 700, to Mr. Jonas Webb, of Babraham, near Cambridge, a Southdown ram, 16 months old, bred by himself.

Third prize of £10, No. 705, to Mr. Jonas Webb, of Babraham, near Cambridge, a Southdown ram, 16 months old, bred by himself.

Class 2.—Rams of any other age.

First prize of £30, No. 711, to Mr. William Rigden, of Hove, near Brighton, a Southdown ram, 28½ months old, bred by himself.

Second prize of £20, No. 744, to Mr. Jonas Webb, of Babraham, near Cambridge, a Southdown ram, 2 years and 5 months old, bred by himself.

Third prize of £10, No. 748, to Mr. Jonas Webb, of Babraham, near Cambridge, a Southdown ram, 3 years and 4 months old, bred by himself.

Class 3.—Shearling Ewes.

First prize of £20, No. 772, to Mr. Jonas Webb, of Babraham, near Cambridge, a pen of five Southdown shearling ewes, 16 months old, bred by himself.

Second prize of £10, No. 770, to Mr. Jonas Webb, of Babraham, near Cambridge, a pen of five Southdown shearling ewes, 16 months old, bred by himself.

Third prize of £10, No. 755, to Mr. William Rigden, of Hove, near Brighton, a pen of five Southdown shearling ewes, 16½ months old, bred by himself.

LONG WOOLS.

Class 1.—Shearling Rams.

First prize of £35, No. 779, to Mr. William Garne, of Aldsworth, near Northleach, Gloucestershire, a Cotswold ram, 16 months old, bred by himself.

Second prize of £15, No. 785, to Mr. William Lane, of Eastington, near Northleach, Gloucestershire, a Cotswold ram, 16 months old, bred by himself.

Class 2 —Rams of any other age.

First prize of £20, No. 794, to Mr. George Hewer, of Ley Gore, near Northleach, Gloucestershire, a Cotswold ram, 40 months old, bred by Mr. Wm. Hewer, of Northleach.

Second prize of £10, No. 790, to Mr. William Garne, of Aldsworth, near Northleach, Gloucestershire, a Cotswold ram, 40 months old, bred by himself.

Class 3.—Shearling Ewes.

First prize of £10, No. 802, to Mr William Lane, of Eastington, near Northleach, Gloucestershire, a pen of 5 Cotswold ewes, 16 months old, bred by himself.

Second prize of £5, No. 801, to Mr. William Lane, of Eastington, near Northleach, Gloucestershire, a pen of 5 Cotswold ewes, 16 months old, bred by himself.

MOUNTAIN SHEEP.

Class 1.—Rams of any age.

First prize of £20, No. 805, to Mr. John Dodd, of Catcleugh, near Otterburn, Northumberland, a pure Cheviot ram, 27 months old, bred by himself.

Second prize of £10, No. 811, to Mr. John Robson, of East Kelder, near Bellingham, Northumberland, a Cheviot ram, 3 years and 4 months old, bred by himself.

Class 2.—Shearling Ewes.

Prize of £10, No. 816, to Mr. John Nurcombe, of Hopcott Farm, near Minehead, Somersetshire, a pen of 5 pure Exmoor Horn Shearling ewes, 1 year and 4½ months old, bred by himself.

Class 3.—Ewes of any age.

Prize of £10, No. 821, to Mr. John Robson, of East Kielder, near Bellingham, Northumberland, a pen of 5 Cheviot ewes, 2 years and 4 months old, bred by himself.

PIGS.

Class 1.—Boars of a large breed.

First prize of £15, No. 823, to Mr. R. Broadhurst Hill, of Bache Hall, near Chester, a large boar, 3 years and 11 months old, bred by Mr. Ashby H. Wilson, of Abbey.

Second prize of £10, No. 841, to Mr. George Edward Taylor, of Oatlands Mill, near Leeds, Yorkshire, a large boar, 2 years and 3 months old, bred by Mr. James Martin, of Meanwood, near Leeds.

Third prize of £5, No. 826, to Mr. John B. Sparing, of Chilton, near Hungerford, Berks, an improved Berks, Sussex, and Neapolitan cross boar, 2 years and 6 months old, bred by himself.

Class 2.—Boars of a small breed.

First prize of £15, No. 847, to Mr. James Dixon, of Westbrook-place, Horton, near Bradford, Yorkshire, a small boar, 2 years and 1 month old, bred by Mr. John Hadwen, of Kebcroyd, near Halifax.

Second prize of £10, No. 837, to Mr. William Ludham, of Bradford, Yorkshire, a small boar, 2 years and 4 months old, bred by himself.

Third prize of £5, No. 868, to Mr. John Radmore, of Thorverton, near Columpton, Devon, a Leicester boar, 10 months old, bred by himself.

Class 3.—Breeding Sows of a large breed.

First prize of £15, No. 902, to Mr. Joseph Tuley, of Keighley, Yorkshire, a large sow, 1 year 2 months and 6 days old, bred by himself.

Second prize of £5, No. 920, to Mr. Charles Jackson, of 46, Goodram Gate, York, a large sow, 1 year and 11 months and 2 weeks old, bred by himself.

Class 4.—Breeding Sows of a small breed.

First prize of £15, No. 943, to Mr. Samuel Druce, jun., of Eynsham, near Oxford, Berks, improved Oxfordshire sow, 1 year and 2½ months old, bred by Mr. Thomas Bowerman, of Eynsham.

Second prize of £5, No. 932, to Mr. George Edward Taylor, of Oatland's Mill, near Leeds, Yorkshire, a small sow, 1 year and 2 months old, bred by himself.

Class 5.—Breeding Sow Pigs of a large breed.

First prize of £10, No. 965, to Mr. Joseph Tuley, of Keighley, Yorkshire, a pen of three large sow pigs, 7 months and 2 weeks old, bred by himself.

Second prize of £5, No. 964, to Mr. Matthew Newman, of Court Farm, Hayes, near Uxbridge, Middlesex, a pen of three improved Berkshire and Essex sow pigs, 7 months and 3 days old, bred by himself.

Class 6.—Breeding Sow Pigs of a small breed.

First prize of £10, No. 976, to Mr. R. G. Barnard, M.P. (now deceased), of Gosfield Hall, near Halstead, Essex, a pen of three improved Essex sow pigs, 22 weeks old, bred by himself.

Second prize of £5, No. 977, to Mr. E. G. Barnard, M.P. (now deceased), of Gosfield Hall, near Halstead, Essex, a pen of three improved Essex sow pigs, 32 weeks old, bred by himself.

SILVER CENTRE-PIECE. BY MOREL.

The first illustration in the next page represents a very beautiful Centre-piece, by Messrs. Morel, of New Burlington-street, and which may be pronounced to be one of the happiest works of its class in the Exhibition. It is in the Louis Quatorze style—the subject a triumphal procession of Cupids with a panther. The little fellows exhibit varied, but appropriate attitudes—those at the corners guiding, rather than absolutely supporting, the branches which hold the candles. On either side, and in the centre, crowning all, are magnificent bouquets of flowers,

CENTRE-PIECE.—BY MOREL, NEW BOND-STREET.—(SEE PRECEDING PAGE.)

Renaissance style, and is very beautiful in its way, both as to design and execution.

GROUP OF SILVER. BY VAN KEMPEN.

Amongst the foreign specimens of silver worthy of notice, and commanding admiration, is a group of nineteen pieces exhibited by Van Kempen, of Utrecht. We have engraved some of these works, which, it will be seen, are chiefly of the *Renaissance* or Louis Quatorze periods. The taste displayed in the designs, and the quality of the workmanship, are equally creditable to the producers, who nobly vindicate the character for taste in art of the Dutch nation.

LIBRARY FURNITURE. BY GILLOW.

The Library Table, Sofa, and Easy Chair, exhibited by Messrs. Gillow

BRONZE CUP.—BY VITOZ.

CARTON PIERRE CORNICE. BY BIELEFIELD.

In the centre of the page is a very beautiful specimen of Messrs. Bielefield's works in *carton pierre*—being a cornice of a rich composition of fruits and foliage.

STAMPED LEATHER HANGINGS. BY LEAKE.

Messrs. Leake's productions in stamped leather, with gilt and coloured ornamentation, are very rich and beautiful. We subjoin two specimens, the designs of which are sufficiently elaborate, without over-crowding.

BRONZE CUP. BY VITOZ.

The Bronze Cup, by Messrs. Vitoz, is in the

CARTON PIERRE CORNICE.—BY BIELEFIELD.

are specimens of the more substantial class of furniture, in which it has been attempted to combine extreme solidity with elaborate adornment. We confess we are by no means well pleased with the result. In cases where so much space is demanded for the absolute utilitarian purpose of the object manufactured, the ambition of the maker should be rather to conceal the bulkiness of it, and to economise room to the utmost extent possible—certainly not to overhang the extreme area required for use by projections of fancy subjects, which, from their location, become obtrusive and objectionable. The arch forming the recess, in the middle of the table, is the most creditable part about it; if the rest of the structure had been arranged upon a

STAMPED LEATHER HANGINGS.—BY LEAKE.

similar principle, the rectangular plan preserved, and the griffins discarded, it would have looked twice as handsome and have been immeasurably better adapted to the purpose than it is at present. The sofa and chair are also to blame for the heavy and uncomfortable-looking embellishments with which they are loaded. It is not mere eye-witticism that should be consulted in such matters: imagine knocking your shins against that sofa or that table, as you make your way past them in an unguarded moment. It is but just to add that the style of workmanship is unexceptionable.

ICE-DISH.—BY DODD.

GROUP OF SILVER.—BY VAN KEMPEN, OF HOLLAND.

LIBRARY FURNITURE.—BY MESSRS. GILLOW.

VIRGIN AND CHILD. BY VAN LINDEN.

M. Van Linden's (of Antwerp) little marble group of the "Virgin and Child" is prettily executed; though there is so much affectation about the position of the hands, and generally in the conventional treatment of the whole of the upper part, that it is more entitled to be regarded as a piece of church decoration than as a work of art. The planting of the foot of the mother upon the head of the serpent may be orthodox according to the orthodoxy of Rome, but it is at variance with the plain reading of the passage in Scripture.—Genesis iii. 15.

VIRGIN AND CHILD.—BY VAN LINDEN.

ICE-DISH. BY DODD.

The Ice Dish by Dodd is a very happy specimen of the taste and fancy at present displayed in this branch of silver manufacture.

ALABASTER VASE. BY CHIACI AND SONS.

Tuscany, not unmindful of its ancient renown, is rich in works of sculpture and carving, generally producing specimens of high excellence. The magnificent alabaster vase, by Chiaci and Sons, of Volterra, is in the pure Etruscan style, and stands upon a pedestal formed of a truncated fluted column. The sculpture upon this production is of exquisite character.

CARVED MINIATURE FRAME. BY W. G. ROGERS.

The carved miniature frame, in box-wood, by Rogers, is one of two very beautiful similar productions in this style. The design comprises a garland various flowers, bound by a twisted ribbon, and placed round a simple bead rolling. Of course, the subject-head inclosed is of our introduction

CARVED MINIATURE FRAME.—BY W. G. ROGERS.

ALABASTER VASE.—TUSCANY.

ARTICLES INTENDED FOR THE PRESERVATION OF HUMAN LIFE.

It is a fact not particularly creditable to humanity, that the ingenuity and industry of our species have been far oftener and far more extensively employed in the construction of machines destructive to life, than machines invented expressly for the purpose of bloodshedding by wholesale and retail. Man they have been devoted to mechanism destined to prolong our days and to shield us from the natural hazards of the elements. Almost the first handiwork of a savage is a club, intended to knock out his neighbour's brains; and one of the last inventions of our own state of civilisation, the reverse, as we are apt to flatter ourselves, of savagism, is an improvement in fire-arms, by which the old musket will probably be outstripped in deadliness just as the musket outstripped the bow and arrow. The Exhibition swarms with implements for taking away life. You have them from every country, and of every age and phase of civilisation. If the New Hollander can make nothing else, he can make a boomerang or a javelin. All the ingenuity and all the *gaieté* art of the Indian workman is devoted to the adornment and finish of costly weapons. The Malay and the Japanese construct artfully-shaped cutlery, intended to make the wound inflicted as severe and difficult to heal as possible. One of the most elaborate and beautiful pieces of metallic production in the Exhibition is the Prussian cannon; while American ingenuity shines in its highest lustre through the six-barrelled revolvers of Colt. It is, we find, by that part of the great manufacturing congress appropriated to our country, that the counterpoise to this flush of deadly implements is principally supplied, and we think that the fact is one for which we may justly take credit. In no country, indeed, in the world is life more carefully estimated, or is the sentiment of horror at the destruction of life more strong and more abiding. In France, an appeal to the God of battles is popularly looked upon as the natural and obvious resort in the case of international differences, or even in that of internal political strife. Look at the readiness of the population to fight at all times, and for all causes; look, too, at the aureole of glory with which military success is always crowned—an aureole brighter far, and far more coveted, than the paler halo which decorates one of our own successful generals. You can very seldom succeed in evoking anything like horror for carnage from a Frenchman. Personally he may be just as humane as the humanity of the Peace Society; but he looks upon battles as natural things, and upon carnage as the natural consequence of battles. The same feeling is more or less prevalent all over the Continent. The people are so used to great displays of military force, that armies and trains of artillery become to them the merest matters of course, inseparable from the concerns of mankind. The national atmosphere in this respect in America is different, but is very peculiar. There are many symptoms by which we may come to the conclusion, that the respect for individual life in the United States is very small, and the first is the characteristic recklessness of the people in steamers and on railways. The national go-aheadism swallows up all other considerations. Never mind the dangers, go-ahead! Better be nowhere than come in second in the race. High pressure everywhere! A shor. life and a merry one. What's the odds so long as you are rapid? Sit down upon the safety-valve, and luck all creation! England would be moved to her very heart's core by an accident which only attracts a passing column in the American journals, and, perhaps, a passing chat in the bar-rooms of American hotels and boarding-houses. A couple of boats race together on one of the southern rivers; one of them blows up, and sends her scorched passengers, like peelings of onions, into the air. The accident has simply been caused by the national desire for going ahead; it is lamented, as a matter of course; it is one of those casualties which must be looked for now and then—one of those casualties which will happen in the best regulated states, and these, of course, are always the most thoroughly and the most recklessly go ahead. In England the whole torrent of national indignation would be invoked upon the memory of the engineer who had blown half his passengers into eternity to get beyond a rival steamer. The coroner's jury would bring in a verdict of wilful murder against him, and most people would regret that he had not survived the explosion on purpose to be hanged. Nothing of the kind in America, however. The culprit would be reckoned a martyr to glorious go-aheadism, and the blown-up travellers a mere quantum of contingent sacrifices. Again, have any of our readers ever remarked the peculiarly off-hand style in which an American newspaper chronicles loss of life, either from accident or in a duel, as it is still the fashion to dub the ferocious encounters with rifles and bowie-knives of the South. A business-like line will tell you that "John Smith fell over the wharf yesterday, and was drowned.' The English journalist would make much more of the occurrence. He would begin by informing you of a "melancholy accident." He would state the particulars of the catastrophe with a decent solemnity of tone, and he would wind up by some commonplace expression of well-meaning regret for the defunct, or of condolence with the widow or the orphans. The difference between the two styles turns entirely upon the greater reverence with which human life is regarded among us than amongst our Transatlantic descendants. The English recorder of Smith's drowning has, possibly, no more feeling of sorrow than the American: but the Englishman writes in deference to and in harmony with a national sentiment which does not exist in the States. So of *rencontres* with rifles and bowie-knives. Two men in England, who would attack each other in the street with deadly weapons, with the deliberate intention of cutting or shooting each other down, would no more be tolerated or tolerable in English society, than would Thurtell or Bishop, or Rush or Courvoisier. We have a fine instinctive reverence for human life, which is one of the most ennobling of our national characteristics; indeed, we sometimes find the sentiment taking the manifestations, which are generally considered, even by the bulk of the people, to be somewhat overstrained; demonstrations, for instance, such as the recent ones of horror and disgust at the wholesale slaughter of those piratical rovers abounding in the seas of the Indian Archipelago. Whether, however, these said demonstrations were maudlin or no, they came from a noble source, and showed the existence of an elevated and a Christian sentiment. The same sentiment, too, it is which gets up Aborigines Protection Societies, and, perhaps a little forgetful of the maxim that charity begins at home, seeks to throw the shield of its protection over the Negro and the Indian—the New Hollander and the Esquimaux.

As was naturalin the range of our inventions for the protection of life, we have principally thought of the perils of the seas. As an element submitted to man's skill, rather than originally given to him as an inheritance, the ocean which has evoked our best qualities, and witnessed our greatest exploits, has also swallowed up our most precious lives, and occasioned our most serious losses of property. It is, of course, undoubted that the great proportion of English human life is regarded amongst us that sudden death are drowned—drowned either upon our own coasts or in distant seas; and therefore, everybody will be prepared to find that contrivances for saving life at sea vastly preponderate over appliances for the same end to be used on shore.

First or all, then, comes the numerous array of the life-boats. Everybody who knows anything at all of maritime matters, knows that nine wrecks out of ten take place from the over-proximity of land. Very many vessels get upon sands and rocks, or are flung upon the shore, for one which springs a leak and founders, or is capsized in deep seas; The greatest danger, for example, in going to Quebec, would not be crossing the Atlantic, but getting clear of the Channel on one side, and working up the St. Lawrence on the other. Sands, not waves, are what the sailor dreads; and rocks, not hurricanes, are his *bêtes noires*. The natural consequence is, that, except in cases where ships are lost upon savage or uninhabited coasts, and upon banks and shoals lying far at sea, the catastrophe takes place in spots not far removed from human aid. The maintenance, then, of a fine of life-boats along the sea-coasts of every maritime country ought to be a regular feature in our civilisation. As yet, however, the system is very imperfect, and is, indeed, confined, so far as efficient practice goes, to the more frequented portions of the English coast. From the mouth of the Thames to the mouth of the Tyne—perhaps, indeed, we may extend the boundaries, and say to the mouth of the Tay—the coast is tolerably well garrisoned with life-boats. Each port, or harbour, or roadstead has several; and where sands, shoals, and rocks abound, a corresponding number of boats dedicated to the preservation of human life is to be found. All along the Yorkshire and the Durham, the Lincolnshire and the Norfolk shores, along which such vast fleets of colliers and coasting craft are constantly creeping, the life-boat force is excellently efficient, and it is that portion of maritime England from which the greater number of models shown in the Exhibition have come. On the opposite coast, however, and, indeed, along the sea-line of the Continent, in general, no such precautions have been taken. You may be cast upon the *falaises* of France, or upon the sand-banks of Belgium or Holland, with but small hope of assistance from the land. Brave and skilful as our neighbours no doubt are, they have not the same instinct for, and the same sympathy with, a seafaring life as we have; and there is none of the patriotic spirit, in the first instance, which provides our life-boats, and little of the enterprise and dauntless pluck which afterwards mans them. We remember being at Boulogne when a large brig at anchor in the bay was in imminent danger of going ashore at the back of the jetty; in which case, from the tremendous surf running, it was very unlikely that a single soul on board would be saved. The great object was, therefore, to get the men out of her while her cable still held. No ordinary boat could have ventured beyond the pier-head. But a subscription life-boat had been some time previously provided, and this craft was immediately manned by five English sailors—boatmen, from the other side of the Channel. Would it be credited, that the port "authorities" of Boulogne actually prohibited the starting of the boat upon her errand of mercy, until a regular bond had been entered into, in which some private English gentleman became bound to the town for the value of the boat in case she was lost, or sustained any injury in the attempt to save the brig's crew! Think of the Mayor of Yarmouth, or of Cromer, or of Whitby, attempting such a stipulation while an easterly gale was blowing, and a wreck was flashing up upon the sands! Knighted, in fact, as it takes the lead in adventuring life upon the sea, naturally takes the lead in inventing means for saving it in case of peril. *Cæteris paribus*, the country which has the most sailors, will have the most life-boats; and the most numerous, and the more energetic will be the means adopted to neutralize the perils.

There is not, perhaps, in the whole range of human enterprise and chivalric valour, a more magnificent spectacle than the starting of a life-boat. There are all the elements of the sublime in the enterprise. The crew are actuated by the purest and holiest disinterestedness. Our law allots handsome pecuniary rewards, in the shape of salvage, to the saver of goods, but not a penny to the saver of life. The magnanimous desire to bring rescue to misfortune is therefore the sole reason which tempts the life-boat crew to go forth at the risk of their lives, and certainly at the expense of everything like comfort and convenience. And there is another class of heroism, little thought of, which ought not, however, to be passed over. The dauntless self-denial of the boatsman's wife, as she sees without a murmur her husband with bold, and inspiring, and encouraging words, her husband, the father of her children, and the prop and stay of the household, put off into the surf on a wild winter's night, to rescue, at the imminent hazard of his life, some hapless crew, are, perhaps, speaking his tongue, and foreign to him and her in sympathies and blood—is not this a species of domestic heroism, which is even higher and finer than the struggles of the boatmen amid the waves? To wait at home, or by the wild sea beach when the boat is gone, is a far more tremendous trial of fortitude than to go in her, and yet it is one which is seldom or never shrunk from. The gale never blew under heaven, in the thick of which an English life-boat, supposing the thing to be physically possible, could not be manned and started, the wives, eager and enthusiastic, and the women resigned and approving, and firm in the consciousness that husbands, fathers, sons, and brothers were but doing their duty. Whoever has lived much upon the coast, can scarcely have missed the sight of some such heroic spectacle, and cannot but be able to corroborate our general description of the spirit in which the life-boat is manned. He will once we have seen what we have described. We have heard the loud rattling cheers rising above the thunder of wind and sea, as, watching its opportunity, the light and graceful boat shot beyond the shelter of the harbour head, and immediately tipped over the back, over the foaming crest of the first rolling sea she met, the crew bending down sternly and resolutely to their oars, and the steersman, in spite of the plunging of the craft, at she tossed and leaped from wave to wave, erect in the stern, intently watching the line of the breakers, and using the long steering-oar instead of his steering-oar, twirling, as it were, the boat over the foaming peak of a sea, while every breath on shore was held by the crowds who expected to see the surge wash over the life-boat bodily. A spectacle even still more exciting is a life-boat putting to sea from a stormy beach, through a surf. Sometimes—indeed, generally—there is a rude stage, or raised wooden way, running out into the breakers. Upon this the boat is hoisted; a rope, sometimes a permanent appendage, made fast to a grapnel by the men on board; the steersman, assisted by the advice of two or three ancient, weather-beaten tritons who stand by him, anxiously watches the run of the seas, waiting for a favourable ninth wave, for the ninth wave, as all seamen and fishermen will tell you, is the biggest; and after it has burst, the two or three first billows of the succeeding series remain unusually heavy even the average of the sea. As soon, then, as the propitious lull has commenced, the signal is given, the rope is hauled upon with quasmodic jerks, the boat flies along the wooden ways—meets and buffets the tossing foaming water—hovers all the time heading as if for life—encounters, perhaps, one or two curling waves, which burst into foam over and around her, and is the next moment dancing on the long ridges of the following seas outside the roaring barrier.

The general characteristics of the life-boats exhibited at the Crystal Palace depend, in some measure, upon the styles of common boat building in vogue in the maritime localities from whence they come. Thus, some spaces are deeper and narrower, others shallower and of greater beam; all, however, agree in having naturally buoyant ends, so as to be able to take the ground easily and without straining, and to sit as lightly as possible on the water. So far as buoyancy is concerned, the common principle adopted seems to be that of constructing an air-tight lining in the interior of the boat—the space between the outward and the inward sides of the vessel gradually widening until a very broad gunwale is formed, extending, perhaps taking either side into calculation, over nearly half the entire beam of the boat. In other specimens, the air-tight cell, if it be such it can be so, is placed lower, running in the form of a square or circular box round the boat, but beneath the thafts or seats. The cork principle seems not to be in much favour; only a few specimens amongst the mass are fitted with those cork belts and jackets which keep the boat nearly as buoyant as air-tight tanks would do, and certainly, from the additional advantage of not being rendered useless by an accidental blow from a sea against the wreck, which would effectually settle many an air-tight boat. This danger, however, it is fair to say, is generally sought to be guarded against by the construction of several air-tight compartments—one of which, we are generally assured, would suffice to keep the boat, with her crew above water. A principle of construction of which we are inclined to approve, especially with reference to surf-boats, is that of building them open beneath, placing the buoyant agency entirely in the sides, and thus letting the seas break in and out as they please—the level in the water of the boat being never altered. There are a great many forms of this principle in the Exhibition, the bottoms of some of the life-boats consisting merely of cross-bars on which to rest the men's feet; while in others there is a flat flooring, only connected, however, by pins and bars with the closed sides of the boat.

The United States show several surf-boats of particular construction, being, in fact, diving spheroids of metal, to be used, so far as we could make out, for the conveyance of passengers through surf, after a communication has been opened with the wreck. The persons to be rescued are simply enclosed in the box in question, which contains enough of air for the short transit, and then they are without more ado hauled through the breakers, either above or below them, according to position, in fact, somewhat similar for the nonce to that of Jonah. We see no reason why the plan should not succeed. Many a nervous lady and gentleman quivers have to cross the surf at Madras would be happy to exchange a catamaran for a metallic surf-boat or a "life car." A number of the life-boats are on wheels—some on two, and others on four. We should think the former plan would be found more generally available, as it is well known that a two-wheeled vehicle gets over the rough ground which the boats would frequently have to cross with far more facility than the more complicated arrangement of four. Life-boats are, of course, shown for port and ship as well as for coast service, and for hanging in davits as well as for being hurried across the country.

The general long and shallow shape may be described as universal, and the boats have an air of suppleness and elasticity which appears to fit them excellently for yielding to the sea and accommodating their position to its heavings. They are all constructed alike at stem and stern, so as to avoid the dangerous necessity of going about. A few have rudders fitted on; but our-steering appears to be more generally practised, probably for the reason that the oar has naturally more command over the boat, as regards turning her head, than the rudder—the two, indeed, acting upon perfectly different principles. The rowing oars are generally attached to pins on the gunwales, so as to allow them to swing alongside when not in use. An ingenious attempt to get rid of part of the difficulty of rowing in a sea-way, from the motion of the craft, is to be found in the model of a boat within a boat—the former swinging freely in the latter, and always preserving its equilibrium, in spite of the rolling of the outward vessel. This class of invention, however, we fear, must be rather classed in the toy category than treated as a modification of importance. Most of the life-boats are fitted up with places for masts, carrying small lug or fore and aft sails, principally intended for use in returning from wrecks and running before the wind. A model on a large scale, with masts and sails displayed, is deposited in the Machinery department. Among the peculiarities of construction in the life-boats, we noticed one from the Isle of Wight, the planks of which, instead of running fore and aft, as usual, were laid diagonally across, from the gunwale to the keel. Another boat, sent from Whitby, is fitted up with cringles supporting nets into which people might leap from a ship, while the boat was kept at such a distance as to diminish the risk of her being swamped against the wreck. Some specimens sent from Birmingham appeared to us to be constructed rather upon abstract practical knowledge, and with more attention to the ordinary rules of flotation, as applied to calm water, than the rude shocks which life-boats must be fashioned to undergo. We should fancy that the crews of the Birmingham boats would find no little difficulty in urging such broad and flat masses to windward. Quite different in appearance are the handsome models sent up to represent the life-boats used at Lowestoft and Yarmouth. They are not very different in general shape from the ordinary fishing craft of the coast. The buoyant apparatus is in the sides beneath the thafts; the oars are double-banked, and hands every port aid in pumping for getting rid of a sea when it fills the boat. The construction is very simple, and there are no such peculiarities as open bottoms to be seen. A label attached to these boats, states that they are in use over a range of coast of about 20 miles; that not one of them has ever been upset, and that they have saved from 800 to 600 lives. The "infallible life-boat" is a whimsical construction, entirely open at the bottom; and made, indeed, exactly after the same fashion bottom and top. The inventor is therefore, we presume, right in the case, that in no respect does the appearance and the capability of the craft will be in no ways altered. He does not explain, however, how the men are to manage in the event of such a catastrope. A Land's-end life-boat is remarkable for the horizontal longitudinal openings, like loop-holes, piercing her sides in continuous lines. Beneath, of course, she is open to the water; which, as in other craft of the same construction, flows freely in and out. The Durham and Northumberland coasts show the greatest number of life-boats; and it is only fair to remark, before passing from the subject, that it was in the former country that the idea originated of a buoyant rowing vessel, capable of living in any sea, and able to bid defiance to the heigt of any billow which might fall on board. About the commencement of the present century; after the occurrence of several disastrous wrecks near South Shields, the inhabitants of that town got up a committee to inquire into the practicability of constructing boats sitted to carry on communication between a wrecked vessel and the shore. A Mr. Greathead, a boat-builder in South Shields, presented the model of such a vessel, and the afterwards employed by the committee to build one upon a practical scale. Several other models and boats were constructed about the same time and owing to the same impetus, so that Mr. Greathead's claim to the honours of invention as to the height

the British and Foreign department, capable of being inflated, when they become small buoys or boats, by means of which, in a strait, a person unable to swim might undoubtedly cross a river; but we suspect, that, for practical purposes, the less unwieldy contrivances, which keep a man immersed in water afloat, will be found better than the cloaks. In the American department, a great number of buoyant contrivances, made of vulcanised India-rubber, attract attention, as the possible means of saving life under peculiar circumstances; but they more strictly belong to the science of military engineering, than to the class of subjects in discussion, of which we are immediately engaged.

Lighthouses are certainly inventions for saving life. We have, however, already pointed out the principal models of these structures in the Exhibition, and explained the principles upon which the lanterns and reflectors are arranged. A simple method, however, for preventing a very common occurrence at sea—the mistaking of one lighthouse for another—is shown. The inventor proposes immediately under the lantern to place a large illuminated letter—the initial of the name of the lighthouse. Many a sad accident has proved that coloured, flashing, and revolving lights are not to be entirely relied on as infallible guides; the initial letter would be easily seen, and form a great additional safeguard. Several systems of night signals to be used at sea are exhibited. They are mostly simple, the coloured lights being produced by sliding stained glass before the flame. Another very simple means of signalising consists in an ordinary gun or blunderbuss with a large speaking trumpet screwed on bayonet-wise to the muzzle. The inventor asserts that the report of a common charge fired in a gun thus furnished, is as loud as that of a cannonade. It may be used, of course, as well on railways, or as a signal in the case of a lonely country-house being broken into, as at sea.

The inventions for the protection of life against fire muster strongly in the Exhibition, although they do not come up in point of number or variety to the contrivances we have just been enumerating, as regards the other element. They may be divided into the general classes—fire-engines and annihilators, intended to quench actual flame; fire-escapes, intended to convey people away from its ravages; and systems of fire-proof construction, intended to set flames at defiance.

The fire-engines exhibited present, as far as we could make out, no very definite principle of novelty. They are such, only perhaps more carefully finished, and more brightly painted and varnished, as we see tearing along the streets when an alarm of a conflagration has been given. We have them of all sizes—from the small parish engine, to the huge machine which takes 40 men to work it, and proves a perfect Niagara upon the burning tenement. A number of small hause-engines—of neat and handy construction, and working on the simplest principles, are also exhibited, chiefly by Mr. Merryweather, in whose department forcing pumps of all sizes, and suitable to all purposes of spouting water, are to be found. Here, too, we have firemen's tools—handy, and light crow-bars, and narrow-bladed tomahawk looking axes, furnished with a spike behind. The light leathern buckets used for conflagrational ends might, we think, be very well adopted for ordinary household purposes, instead of the heavy pails now ordinarily in use. In the Canadian department is a very handsome fire-engine, sent as a model of those used across the Atlantic. It works on the same pumping principle as ours; but the mechanism is more elaborate, and the machine seems far more complicated, and easily put out of order. It is painted in the most glaring fashion—both bright and garish, in fact, as to have rather the appearance of a triumphal chariot than that of the most utilitarian of machines. In the Canadian towns these engines are generally drawn along by the crowd, a couple of coils of rope being arranged upon the fore-part, so as to be capable of being immediately handed out to the willing grasp of the multitude. In winter, the fire-engine, like allother carriages in Canada, are put upon sleigh-irons. The proof of the pudding, however, being in the eating, and that of the fire-engine in the spouting, an English and a Canadian machine were brought out at the edge of the Serpentine, and tried—the result being, that the jet of the colonial implement, which spouted the water nearly a third higher than the English one. We were informed, however, that on the conducting pipe being held in a horizontal position, the latter machine sent its stream further along than the former; and it was added that the British-built engine threw a greater quantity of water in proportion to the number of men pumping. An official account of the experiment would, however, be desirable, the details which have got abroad being very far from being complete or consistent.

An immense number of fire-escapes are shown—some of them ladders on wheels acting from the street; others, either rope ladders or lines for descent, acting from the roof or windows. We will enumerate a few of the leading ones in this respect. Waller's fire-escape is an iron ladder, hooking to the parapet commonly made in front of houses immediately before the lower part of the roof. Jackson and Clay show a bedroom fire-escape, consisting of a wire cord, with a belt for passing round the body, the cord is coiled upon a reel, placed in the inside of what appears to be an ordinary article of bedroom furniture; but we could not make out how the inventor proposed to regulate the rapidity of the descent. Another bedroom escape consists of a strong funnel of canvass, which can be flung into the street, and through which the persons in danger would slide. This machine could not, of course, be used in the case of flames bursting from a lower window. A bobbin ladder escape is simple, and will probably come cheap. There are a number of these simple ladder forms in rope, iron, and wood. Mr. Waller gives an escape with which ranges of houses may be fitted up, and persons conveyed horizontally along from one window to another; while a great number of escapes to be managed by the people below, many of them sliding out on the principle of telescopes, are exhibited, in models or cases or less complication. We are strongly inclined, however, to think that by far the most efficient mode of saving life in case of fire is to have easy and ready means of access to the roof, and then proper facilities for clambering along to the nearest house in safety.

There are several models of contrivances for making houses fire-proof. One is by a complicated system of water-pipes proceeding through the walls, like veins through the body; others depend upon more manageable and less expensive systems of building, and upon peculiarities of materials—such as the hollow bricks with which Prince Albert's cottages are constructed. The progress of industrial science as regards the building of houses is now undoubtedly showing strong tendencies carefully to study the architectural and constructive conditions which are least likely to be operated on by fire; and although no house can probably be erected which shall be completely fire-proof, yet most new buildings are so managed that the flames are slow in progress, and far more easily checked than in old constructions.

In and near the Machinery Department may be seen several models of contrivances destined to protect and preserve life under ground. The deeply interesting model of a coal-mine shows how the air is forced through miles and miles of subterraneous workings by the very simple process of creating a comparative vacuum by the continued burning of a small fire. There are generally two shafts to a mine, the one ascendant and the up-cast. At the bottom of the latter the ventilating fire is kindled; the vacuum thus created sucking, as it were, the air from all the neighbouring passages; its place being in turn supplied by a corresponding draft along the down-cast shaft. In some of the great old mines near Newcastle the air has to travel through upwards of 70 miles of passages before it arrives at the furnace to which it is steadily moving, and it is calculated that from 24 to 30 hours are consumed upon the Journey. Without this constant current, mines would of course be unworkable. In one or two instances, a steam blast has been applied, instead of a furnace, with satisfactory results; but the ancient method seems generally to hold its ground. We remarked several specimens of Davy's safety lamps scattered about, but their principle and construction are too well known to call for any particular remark. It is made to be wished, however, that the mining population would do this great invention justice. Half, at least, of the explosions which take place in mines are occasioned by the workmen taking off the wire gauze, either for the purpose of getting a degree more light, or of kindling their pipe at the flame. A most ingenious and simple invention, by a Mr. Fourdrinier, for preventing shaft accidents caused by the breaking of the rope, is shown; in model, beside it, another contrivance, proceeding upon the same principle. The method is beautifully simple. The pressure upon the rope, when the car is ascending or descending—"riding," as it is called in Northumberland and Durham—bends back, and renders inoperative, certain spring clasps, which, however, the moment the strain upon them is relieved by the parting of the rope, leap out, as it were, on either side and catch hold of the upright beams down which the car slides, thus holding the whole machine suspended in the shaft until assistance reach it from above. In Mr. Begg's model, the shaft is provided with a set of metallic notches, like those which prevent the back-play of a winch, and, on the cessation of pressure, the motion of the [illegible] arrested in an instant by projecting pieces of metal, which [illegible] their position, and become fixed in the notches. Fourdrinier's invention is, we believe, in use in one of the pits near Newcastle; but some safeguard of the kind ought to be universal, and the more so that the pit-men are notoriously reckless in ascending and descending the shafts of coal and other mines.

FOOD OF MAN.—NO. III.

VEGETAL SUBSTANCES.—FRUITS, SUGAR, STARCH, ALCOHOL, &c.

NOTWITHSTANDING the numerous articles of food we described in our last articles, yet there are still various other substances which are almost indispensable to the food of man.

The vegetable acids, or fresh vegetables, have a power which, although well known to the surgeon, appears to be inexplicable to the physiologist. Our sailors suffer terribly from scurvy if deprived of these things, and hence there appears to be a great necessity for their use. Usually [illegible] son- take this necessary nourishment by eating various fruits at the various [illegible] of the country. We have of the class of food very excellent [illegible] preserved gooseberries, currants, and raspberries, plums, black [illegible], damsons, and cherries, shown by Mr. Batty. A very fine collection of these fruits, which can be kept all the year round, are also shown by Messrs. Faulkner and Messrs. Copeland.

Of other fruits we have three or four Wellington apples, the exhibition of which by themselves seems ludicrous enough, when, by a visit to the Horticultural Gardens, those curious in such fruits may see at one view nearly all which is known on the subject arranged by Mr. Thompson. They have also a set of casts which ought by rights to have been sent to the Exhibition, as many countrymen have but little idea of the almost innumerable varieties of apples, pears, &c. which are known to horticulturists

Of other fruits used for food, perhaps the chesnut holds a high place. In some parts of the south of Europe it is used for bread. It contains a large quantity of starchy material, and forms, when boiled or baked, a very useful and nutritious food. A few chesnuts are sent from many countries. These beautiful trees abound in Greenwich-Park, and most stately specimens may be noticed in some fields near Turnham-green. Whenever we have a long continued and hot summer, the fruit attains to considerable perfection, and the trees yield great produce. Of southern fruits, the bread-fruit was once supposed to hold the first place, but we have not observed it to be represented in any other way at the Exhibition than by a cast. We observed yesterday a bread-fruit tree at the Botanic Gardens, Regent's-Park. The banana in the West Indies is very highly esteemed. It forms a nutritious food, and may be seen by the curious now in full fruit at Kew Gardens. It is represented in the dried state from British Guiana, and, far as looks go, seems delicious enough, but we have had no opportunity of tasting it.

The delicious pine-apple is shown in the dried state, and also preserved with dilute vinegar. The Chinese fruit, the litchi, are shown by Faulkner and Mason. Dried grapes, figs, and dates are contributed by various nations; and two or three shadlocks may be seen in the colonial department. Olives are supplied by many exhibitors, and there are other foreign fruits represented by models, which we have not a sufficient practical acquaintance with to describe.

Barcelona nuts are shown in the Spanish department, while the walnut is furnished by a great many countries. Some very fine Brazil nuts may be seen; the cashew nut, deprived of its inflammable juice, and other kinds of nuts, are shown by Messrs. Fortnum and Mason. The Africans have contributed their ground nuts, some of which we have recently seen in the shop windows for the first time, though we have continually met with them in the homes of sailors who trade with Africa.

None of the above can be said to be of much importance as articles of food; and the same remark may be made of the almond, which is abundantly represented by superb specimens from various districts.

In the American department, some of the noble peaches which that country affords are shown, preserved in a manner peculiar to that nation. They are intended as a present to the Queen, and are preserved in brandy. As far as appearance go, they look sufficiently peachlike; but, if every critic was allowed the privilege of tasting, we are afraid that her Majesty would come in but for a very small share at the last.

We have numerous specimens of sugar from various sources. The sugar-cane yields that which is most in repute; and Mr. Perkins has shown a small loaf from sugar-canes which he himself grew in the sunny soil of Surrey. Their growth was a singular whim; but it is worth recording that such a feat had been accomplished in this country. We have not only from the tropics contributing examples of sugar, but amongst the machines we have contrivances for purifying it by centrifugal force, and also means for evaporating it in vacuo, which should be carefully examined. We have not noticed any specimens of its purification by lead, which has lately occupied so much the attention of the chemists and the Government. The public and the profession are much frightened at the idea of so deadly a poison as lead being employed, and yet the chemists have decided that the process may be carried out without any trace of lead being left in the saccharine matter. If the process is allowed, every packet ought to be stamped "Refined by lead," to give the public an opportunity to buy.

There are also specimens of the sugar made from the maple tree, and we have no doubt that the tree itself exists in the Arboretum of Kensington-gardens. There is also an example of the sugar which may be produced from honey, and another example where it is manufactured from manna. The sugar of milk, so much employed by homœopathic quacks for the delusion of their victims, is also exhibited. Specimens of sugar from potato starch are shown. This manufacture, we have this day learnt from a large sugar-broker, is not now carried on, but we are not quite certain upon that head. A small specimen which we have before us whilst we write is bitter to the taste, from the presence of a small quantity of sulphate of lime. It moreover possesses but very little sweetness, and, when added to cane sugar, diminishes the sweetness which it before possessed. For this cause, it must be regarded merely as an adulterating substance. The manufacture of sugar from linen rags does not appear to be a successful speculation, as none is shown. The properties of sugar in the system are due to the hydrogen and carbon which it contains, and which enter into combination in the body, and are finally excreted in the form of water and carbonic acid. By these changes physiologists suppose that the warmth of the body is maintained. Sugar, during its transformation, appears also, if supplied in excess, to be convertible into fat; and we are informed by those who have had large sugar plantations, that the negroes, during the harvest, live principally upon the cane juice, and thus become surprisingly fattened before the harvest is terminated. Pure sugar contains no nitrogen, and hence is incapable of preserving for any length of time human existence, as it cannot supply the material for muscular strength.

We suppose that honey must be classed amongst the vegetable products. It appears to be simply collected by bees from flowers, and we have known cruel schoolboys to kill the bee while carrying it to the hive, for the sake of the little bag of honey. The qualities of the honey of course with the flowers from which it is obtained, and the best is that which is collected from open commons covered with wild thyme and heather, a specimen of which is shown by Messrs. Fortnum. The London visitor to the Exhibition should not omit to see the bees at work in the Royal Horticultural.

The use of sugar to preserve fruits in a crystallised state is well represented. Perhaps Messrs. Fortnum and Mason have shown the most extensive collection; and if the apparently delicious dried fruits of almost every kind which they have exhibited did not make many a schoolboy's mouth water during the Whitsun holidays, the boys of modern times will never become gourmunds. The race of those who gluttonise at the civic feasts will become extinct, according to the ordinary law of mortality, and the very Guildhall will marvel when the intellectual enjoyment of social intercourse shall in the next generation yield to the present exclusive love of merely animal feasting.

The nuns have long, in Spain and Portugal, been famous for the preparation of dried fruit. From the nuns of Combra, the dried fruits of first-rate excellence have been shown. From the Cape of Good Hope delicious preserved oranges are also shown; and from Persia the dried juice of the grape made into a sweetmeat, either with or without almonds, has also been contributed.

In one department lozenges from the pine-apple, jargonelle pears, and various other fruits have been sent. Mr Laugdale has furnished oils of cognac, pears, pine-apples, and grapes, which so exactly taste and smell of those fruits, that few would be able to distinguish them. These preparations are, to our mind, the most extraordinary of the results of modern chemistry; for the fruits themselves have nothing to do with the matter, and they are simply made from the refuse of distilleries. We hear that they are now extensively employed; and who can tell how many vegetable principles may not be ultimately made by merely chemical processes? Various specimens of jams are sent, which virtually consist of fruit boiled in syrups until they obtain a nearly solid consistence.

Starch is shown as manufactured from various substances and adapted to numerous uses. For purposes of diet, those derived either from the *Maranta arundinacea*, (arrowroot) or canna root, are most employed [illegible] plants only grow in tropical countries, and therefore those materials can only be shown from such places. Potato starch is largely made to [illegible] to the other substances as an adulteration. For culinary purposes, starch is also exhibited from wheat, sago, rice, potatoes, &c.

By long-continued heat starch is altered in quality, and becomes converted into a sort of gum or dextrine. which in many particulars widely differs from starch. Every kind of starch appears to be enveloped in a membrane, which is insoluble in cold water. After roasting the envelope is burst, and the material is rendered perfectly soluble. For this reason, the baked flour forms a food which is well adapted to infants, because the starch is altered in quality.

All the starches, including those of arrow-root and canna-root, are quite insufficient for the prolonged sustenance of life They may give warmth to the body, they may fatten the individual, but they cannot give the muscular substance, and in fact an animal would be absolutely starved by the prolonged use of this substance.

From British Guiana, starch is shown as extracted from the buck yam; also other specimens from the cassava or edible-rooted physic-nut. Other preparations from this plant are called tapioca, a light delicious food when used with milk. Whilst upon starches, we may mention that two sago palm-trees have been sent to the Building by Mr. Knight, and the starch from the plantain is also shown.

The properties, doubtless, of the spices are multifarious; some stimulate digestion, others are a provocative to the appetite, and doubtless all serve some function. The London Spice Company have sent splendid specimens of mace, nutmegs, cloves, cinnamon, cassia, pimento, black and white pepper, ginger, and caraway seeds. There is a very beautiful specimen of nutmeg and mace shown in the department for the colonies. A cut specimen from this country was shown at the Royal Botanic Gardens a last week. The cinnamon tree may be seen in nearly every nursery ground; the pepper trees may be seen at Kew, and ginger is a common plant in many gentlemen's hothouses. Messrs. Batty have also sent specimens of essences of spices.

Of mineral food, salt is of paramount importance. It supplies both soda and chlorine, which have various properties in assisting the changes of other food. Messrs. Noak have sent specimens of water from the brine-spring, with pieces of rock salt as dug from the mine, together with samples of the manufactured salt.

Vinegar is a favourite addition to many vegetables. Whether it plays any part in the human economy, is a matter of much uncertainty. Various samples are shown of vinegar from malt, and also of the same distilled. The peculiar property which this material has to prevent decomposition is well shown by Mr. Batty, who has sent branches of orange, lemon and citron trees, cucumbers growing on the vine, a cactus, apple, melon, and even a fine English pine-apple, which has been sacrificed to exhibit this principle. We are informed, that if botanical specimens are carefully put up in this manner, they will last for any length of time a fact of some importance to curators, who, hitherto, have been somewhat at a loss to preserve plants. It is a curious fact, that, whilst distilled vinegar has this property, the pyroligneous acid dissolves the vegetable tissue, and ultimately destroys it.

By the use of vinegar as a preserving agent, pickles are made, and various examples are contributed. The best Indian pickle is made of the capsicum, hedgehog cucumber, mountain cabbage, and pan-pas, mixed in distilled vinegar. Various examples of other pickles are also shown good perfection by Mr. Batty and other exhibitors

Sea-weeds are exhibited. These generally contain a small quantity of iodine, and the Iceland moss makes a nutritious jelly. Of fungi, only two are generally eaten in this country, whilst in Italy the people use a great number of species. In the French department, preserved cases of truffles are shewn, and we have noticed mushrooms amongst the pickles. These fungi are remarkable for the large quantity of nitrogenised matter which they contain.

Modern chemists have been very desirous of obtaining a food which shall in some degree be more nutritious than the vegetable diet alone. In a former article, we alluded to the compounds of animal with vegetable substances, but the same results may be obtained from vegetable productions alone Madame St. Etienne has sent many such compounds, made by adding gluten to wheaten flour and many other substances. We rather suspect that Mr. Bullock's semola is an article of somewhat similar character. The tendencies of the age incline mankind then to think very highly of the principle of obtaining a compound with a greater amount of gluten, which is the material which gives the muscular strength. At present, however, there has not been sufficient experience to determine whether any compound containing a larger quantity of gluten may be generally adopted with advantage. Bread made of pure gluten, for some diseases, has been found so heavy as not to be sufficiently palatable to be eaten.

Many specimens of biscuits are shewn in different parts of the Building. There are also abundant examples of maccaroni, vermicelli, and other preparations from flour. We have not observed Hard's farinaceous food, which we believe is only wheat flour altered by long-continued heat. We have the highest opinion of this food for infants, and regret that we have not seen it in the Building.

The whole range of alcohols and alcoholic drinks are very poorly represented. Regardless of their value in the arts, or as an article of food [illegible] they were not allowed to be exhibited, because they are sometimes turned to a bad purpose. For similar reasons, types might have been prevented, because bad books were sometimes printed; writings, because forgeries were committed; and electro-metallurgic specimens, because they might be serviceable to the false coiner. Messrs. Hanbury and Buxton have shown an imperial gallon of ale, and the same quantity of porter, with samples of the materials employed; and the visitor may observe that the colour of the porter arises from the use of a certain quantity of burnt, charred or burnt malt, and the flavour of this delicious beverage is due to the same circumstance. Great efforts have been made to suppress the use of these drinks; but the majority of the most eminent medical professors consider that the moderate employment of alcoholic stimuli tends rather, at any rate in large cities, to the preservation of life. Of course, the excessive application, or of even their use in but slight cases, medical men consider that they are destructive to human life; and, from inquiries we have made, we learn that, notwithstanding the great competition amongst life assurance offices, none will assure the lives of persons who take a little above the average of alcoholic stimuli; and even at the Medical Invalid and Gresham Offices, both of which will assure lives with certain amounts of disease, no drunkard is admitted at any increased premium. This, as an acting opinion of the first medical authorities in Great Britain, is important; and, doubtless, its mention will not be lost upon the public. We cannot find, as a universal rule, that the lives of teetotallers are preferred; and we are informed by assurance office examiners, that the majority of those who confine their drink to water alone are pale, flabby, and do not exhibit the full standard of strength and health.

Messrs. Bovin and Co. have contributed six bottles of champagne wine manufactured in England from rhubarb stalk. This vegetable production is now much employed as an article of food; but that which is brought to market, forced with straw, is more wholesome than that which is sold at this period of the year. This substance contains a great amount of oxalic acid, and is hence found by many persons to be far less digestible than gooseberries, currants, or other fruits, the acidity of which is due to the citric, tartaric, and malic acids. Mr. Roberts, of Edinburgh, has sent specimens of home-made wines: these drinks, however, give way to the use of malt liquors in this climate, and are used to a very small extent as compared with beer and porter. A bottle of alcohol from potatoes is exhibited. The excise laws, however, greatly interfere with this branch of manufacture, and if we were working from potatoes on an extensive scale, we might have to pay thousands of pounds of duty annually for spirit which we could not produce. There was a potato distillery erected near Vauxhall turnpike, about fifteen or twenty years ago, by a company of Frenchmen, but they only worked about two months when they became insolvent, in consequence of being charged by the excise with much more spirits than they could possibly make from potato wort.

Vegetable oils are employed in some parts of the world to a considerable extent for food, and even the English use it in their salads. Olive oil is furnished from various countries; but perhaps the most interesting specimen which has been furnished has been supplied from our own colonies. Adelaide, in South Australia, and at any rate the capacity to grows olives mark a climate which must be much warmer than our own.

Numerous as are the articles of food exhibited, they do not nearly include all the varieties of each kind which are employed, nor even is every species of vegetal substance represented which is occasionally eaten. Every cockney schoolboy knows that he can find pig-nuts in Kensington-gardens, immediately outside the Building, and yet this is not furnished. It would indeed have been a curious spectacle to have seen collected under one roof every kind of material used by man for food. As it is, the materials are disconnected and scattered in every part of the Building, and yet they present many features for much attention and careful study.

The necessity for food arises from the law that without change of matter we can have no force, and hence animal force requires a supply of matter to be changed. The various forces which the animal evinces from the change of matter are called the vital forces, and the study of their phenomena, when classed together, is called the Science of Life. Vitality is to the animal body what the performance of the engine is to its mechanism. Neither can continue without a constant supply of matter to be changed. Both necessarily infer a continual manifestation of new attractions, and consequently continually exhibit motion. Of life it may be well said—

> She dreads an instant pause,
> And lives but while she moves.

THE GREAT EXHIBITION.—

NSEPT. LOOKING SOUTH.

A LADY'S GLANCE AT THE GREAT EXHIBITION.

No. II.

HAVING alluded, in my former glance at the Exhibition in Hyde park, to the beauty of the *laces* collected there from the various Continental states, as well as from the different provinces of our own country, I must now endeavour to justify my eulogium by attempting to describe more minutely a few of the specimens peculiarly worthy of observation, which present themselves there in such abundance. The majority of my readers are doubtless aware of the many fabrics that range themselves under the general appellation of lace by right, no less than of the numerous machine-woven imitations which lay claim to the distinction by courtesy, but which the connoisseur can never be prevailed upon to award them unaccompanied by some qualifying prefix, sufficient to distinguish the copy, however perfect it may be, from the genuine and undoubted original.

Of the real laces that present themselves to our admiration, perhaps the most worthy to be first named are such as are wrought solely and consecutively by hand on the lace-pillow; these are all made of the finest Flemish thread, and are distinguished as Mechlin, Valenciennes, Honiton, and English Lisle or Buckingham, with a variety known as *guipure*, made also by hand with a crochet needle. The white silk lace known as blonde is also wrought in the same way, with the black varieties of Chantilly, Puy, and Grammont; introducing a few slight distinctions, too minute to need particular observation in this place. Another description, equally attractive to the generality of lace-fanciers, and of no less mercantile value, is that of the well-known and highly-prized Brussels lace, set apart, from its extreme lightness, for full dress, with the beautiful modern invention of Honiton *appliqué*. In these elegant varieties the flowers are made separately on the pillow, and afterwards attached to the groundwork, which (in the finest specimens), though simply consisting of plain lace, is, as being also made by hand on the pillow, equally genuine with the decoration itself; and in this particular forcibly reminding us of those works of the old masters, in which the principal figures, only, were painted with their own hands, the subordinate background being filled in by artists less skilled in their profession, or less highly gifted by nature than themselves.

As from time immemorial Holland and its dependencies have been distinguished for the perfection to which their fostering care has raised this beautiful fabric, it seems but a tribute due to give the precedence in every description to the lace manufacturers of Belgium, more especially as they appear in the present day fully prepared to maintain the vantage-ground earned in times past.

For this superiority many reasons suggest themselves. The Flemings have been for ages noted as the most successful cultivators and dressers of flax; hence, they have held in their own hands exclusively, the raw material for the most finished productions: in distributing this over the whole world, it is not unnatural that they should have chosen (in former times, at least) to reserve for their own use a liberal share of the choicest and best description. A convincing proof of their skill is afforded by the fact, that they are known to have wrought thread of so fine a texture as to exceed in value ten times the price of standard gold. This having been the case in former years, it is difficult to form an idea of the perfection to which they may not have attained.

Before proceeding to notice individually the beautiful examples of lace-work contributed by Belgium, I must be permitted to observe on the lack of courtesy shown by some of the exhibitors in this class, which contrasts rather unfavourably with that of their French compatriots, and even some of their own neighbours in the same department. The spectator is in many instances prevented from approaching by a barrier, placed so far from the glass cases in which the works are displayed, as to lead the uninitiated to believe in the existence of some other reason for their exclusion, apart from the protection of the property. This extreme caution is additionally to be regretted, inasmuch as the specimens displayed would bear the closest inspection. The convenience of the public, therefore, seems to be encroached upon without any adequate reason. The first article which claims an especial notice at my hands is a pocket-handkerchief, exhibited by Vanderhagen van Overloop, of B ussels; it is framed like a picture, and may fairly claim to rank as a work of art. The pattern is circular, and composed of the finest cambric; the border surrounding it is lace-work, of a clear, though elaborate design, comprising the initials of her Majesty, with the Royal arms of England; whilst the corners, necessarily deeper than the sides, are enriched with emblematical devices of Peace, Science, Industry, Shipping, and the Fine Arts. The chief peculiarity, I might say curiosity, of this border, consists in the fact that the ornamental pattern and the plain groundwork to which it is attached were both worked by needle *at the same time* and with the same thread, not being separately wrought, as is usually the case. A little history of this article, with the name of the actual maker, would be of interest to all capable of estimating the patience and ingenuity required for the production of a piece of work so peculiar, if not actually unique. Another fine specimen of a pocket-handkerchief (also worked with a needle by a Miss Roy, of Brussels) claims our admiration; with a lace flounce of Gothic pattern, intermixed with birds and roses. There is also part of a second flounce of still more elegant device, consisting of flowers and imitative drapery; nor must I omit a singularly beautiful detached spray without background, which would seem a faithful representation of a bunch of flowers just gathered, and transferred, as it were, into a delicate lace on the straw pillow. A very fine example of the genuine Brussels lace is exhibited by A. Delahaye, in a scarf and flounce; several veils and falls of a similar kind are also well worthy of attention. Of the delicate white blond, the black Grammont, and other varieties of the same school of silk laces, the Messrs. Stoequart display (307) an extensive assortment, adapted to almost every purpose, from shawls and mantillas, to head-dresses and lappets; with some beautiful specimens of appropriate pattern designed for parasols, many of which are displayed to great advantage, ready mounted and fitted for use. I must especially notice a parasol of elaborate design and perfect execution. Perhaps the finest examples of delicate lace are never so exhibited as in this peculiar form; in flounces, the more showy pattern has a better effect than delicate tracery, which is too often lost in the distance, and in heavy veils of the order which is fit is attached. In veils and lappets, the want of a close background is felt as a disadvantage, and in collars it is difficult to preserve the requisite smoothness. It is, therefore, to the berthe and canezou, that the patient artist is indebted for a perfect display of a *chef d'œuvre*, inasmuch as form, background, and proximity are all in her favour. M. Duhaljon exhibits (314) a case of Valenciennes and Brussels trimmings, of various patterns and widths, varying from half an inch to a quarter of a yard. We have been so long accustomed to see the former of these descriptions of laces made with rather a heavy pattern, that we scarcely recognise an old favourite in the lighter adornments of the present specimens; nor are we certain, that, in a lace distinguished for its usefulness and durability, the change is in every respect an improvement. Solidity seems as much an attribute of Valenciennes, as lightness of design is of the filmy groundwork of the Brussels. It is, however, a feature of the taste peculiar to the present day to engraft as many varieties as possible on an ancient stock—I cannot but think, to the prejudice of that individuality which forms an agreeable characteristic in specimens even of the lower grades of manufactures. Great credit is, however, due to M. Duhaljon for the introduction of laces the width of moderate dress flounces, of a description hitherto seldom, if ever, made sufficiently wide to be used for such a purpose. Beautiful specimens of *appliqué* lace are presented (case 318) by Naeltjens, Brussels, in the form of a cassaveke and half shawl; there are also three veils from Florence, interesting as examples of Italian workmanship, which is not often exercised in this manufacture, rather than as affording anything remarkable in themselves.

Several large and elegant examples of the same kind of lace termed Pompadour merit especial notice: it consists of a white design on a black grounding, and is very effective worn as slight mourning, though almost too pretty to be entirely devoted to this purpose. In the present instance it is applied to scarfs, shawls, collars, and trimming inserting. The productions of M. Roby (331) are distinguished as exhibiting on a large scale specimens of Brussels lace, not often equalled, and never surpassed, even on a small one: a complete dress of this beautiful material, composed of three straight flounces, attached to each other, with headdress and ruffles *en suite*, is exhibited on a wax figure, and, under ordinary circumstances, would almost form an exhibition of itself. Sophie Defreune (316) contributes several lace collars of remarkable beauty and novel design, in which flowers do *not* form the principal adornment. A Brussels lace handkerchief, berthe, and headdress are all equally effective, though each differing in style. The establishment of St. Joseph, at Louvain, contributes a beautiful specimen of the *point* of almost every variety; those formed of Flanders *guipure* are of peculiar interest, as presenting a reproduction of the old English point in a state of perfection for which we should now look in vain in our own country, and which cannot be accounted for in the present absence of this description, a collar and ruffles, the pattern of which somewhat resembles a large scallop shell, cannot fail to attract the eye of the most casual beholder, and to detain that of the connoisseur until she is warned that other attractions yet await her. These are provided by Madame Bousson de Vliegher, of Bruges, in the form of two splendid flounces, of real and very fine point lace, which are advantageously displayed on a sheet of crimson velvet. The collection of Valenciennes laces sent by Messrs. Beck, of Courtrai (324), deserves much more detailed description than I can now give; they are second to none, and are far more beautiful than any of the same kind seen in this country previously to the present magnificent display. A few exquisite articles of Mechlin lace (333), by Miss Van Kiel, cannot be too highly extolled: among these are a headdress, collar, and veil: one lappet, with a pattern of birds, butterflies, and flowers, is left unfinished, with its multiplicity of bobbins depending from it, to show the cobweb-like thread of which it is made, and also what may be achieved by the most unpretending machinery when guided by fingers well accustomed to their art. Another exhibitor presents us with a perfect picture, in lace—with alcoves, bridges, figures, flowers, and even birdcages, all so naturally blended together, that no idea of incongruity arises in the mind of the spectator from the variety of objects thus associated. There are also, among these decorations fit for princes, some very pretty specimens of collars and lace made at Bruges, in the schools of industry for the poor.

Before concluding my survey of this department, I must record my admiration of a piece of work intended for *appliquer*, the elegant design of which is an openwork basket filled with flowers of many kinds, beautifully grouped, and formed of the finest Brussels lace: this is disposed on a velvet cushion, and, as in a former instance, a few bobbins remain suspended from it. A handkerchief depicting the British arms, with emblems of Australia (G) must be also mentioned by Van der halen, of Brussels (313), the fortunate holder of the only medal awarded for such fabrics by the National Exhibition of Belgium in 1847. It is almost superfluous to say that it is a masterpiece of art; and with this I must absolutely conclude my notice of Belgian lace, as any description must be to convey an idea of this manufacture, either *en général* or *en détail*.

Of Spanish lace, a very small assortment is presented to view in the Crystal Palace. This is rather a remarkable fact, when it is remembered how large a quantity is in general demand in a country where the highest classes still preserve a national costume, the distinguishing features of which are the lace mantillas for the head, and the richly-flowered shawl drapery of the same material. Of the ancient Spanish point, so liberally introduced in the pictures of the Spanish school of painting, not a single specimen is to be seen. It is, therefore, to be inferred that the Spanish ladies must for this decoration be largely indebted to their French neighbours. Of the few specimens of native manufacture worthy of notice, I may instance a mantilla thickly flowered, but of a pattern by no means remarkable; another of white blond, and a lace shawl of a light running pattern, with medallions in the corners for the initials or arms of the wearer. A very fine specimen of black silk lace is exhibited by Fuster, of Barcelona, which demands a more detailed description than can be given at present, from the novel and striking character of its design. It represents a Spanish grandee on horseback, fully accoutred; a sportsman, with his dog and gun; and, finally, a lady riding in state in a palanquin, with animals of every description, both foreign and domestic, attending her on a kind of march. Another example, by the same maker, displays a complete landscape *à la Chinoise*, with men, women, and children, employed in the ordinary occupations of life. It includes, also, pagodas and bridges, with their fitting accompaniments of broad-leaved trees, very effective in this careful display. We have here ample proof of what might be achieved by the Spaniards in this branch of the arts, were there a greater amount of enterprise in the people, and a more fostering care of home manufacture on the part of Government; more especially as the country itself produces in abundance the raw material.

In the French department, having on a former occasion alluded to the *novelty* of Madame Hubert's lace flowers, I must only further observe, on better authority than my own, that in this respect they bear away the palm from every competitor, and that they are not likely to be speedily rivalled by a lappet sent by M. Delcambre, of the Rue de Choiseul, Paris. This elegant specimen is composed of fine gold-coloured blond, wrought of silk in its natural shade, and ornamented in the making with soft gold thread of the same colour. The design for this veil has been selected wit equal taste and propriety, representing ears of wheat and rye: the spikes of the latter extending over the groundwork, whilst the irregular outline of the corn forms the border. This is a very artistic improvement on the usual plain shaped edge, but it will be for the present confined to articles of the most *recherché* description. The next examples to be distinguished are those contributed by M. Lefebvre, of Bayeux, who holds no less than five medals and the cross of the Legion of Honour as testimonials of his art.

We have here a fine thread lace counterpane, well adapted to throw over the satin quilt, which the Parisian *élégante* is so proud of exhibiting in her sta*e chambre-à-coucher*, although, like greater persons, she wisely chooses a less elaborate resting-place for actual use. There is likewise a set of lappets of the exquisite point d'alençon, the pattern of which comprises the Royal crown surrounded by a drapery, the imitative folds of which form an irregular border, and present a most *ensemble* of extreme beauty. A rich point lace scarf and veil are deserving of attention, with a Chantilly mantle of arabesque design, and one or two deep lace flounces. These are all I can afford space to particularise.

Of white blonde, M. Randon, of Caen (Calvados), may perhaps be considered the best exponent in this collection (1684) with a mantilla and overall of great beauty: the groundwork is of the fine t quality, with the leaves and fruit of the grape vine running over it as a pattern; they are the natural size, and of a quality that may almost be called massive. These are intended to be used where everything ornamental is chosen in a state of heavy magnificence, contrasting forcibly with the lightness most admired in this country. A beautiful *parure* of lace, belonging to the Duchess of Somerset, is exhibited, as being of very fine workmanship: the pattern is the same as that in vogue at the period of the style of decoration that prevailed during the middle ages, when every lady wove her own herald, and exhibited on the most insignificant part of her attire, her "Arms and State;" it is well worthy to descend as an heirloom to posterity.

The Foreign lace, which, as presented in the Exhibition, I have endeavoured to describe, though now familiar to every one, has only been general in England for some five and thirty years. Before the peace had made us acquainted with the skill of our Continental neighbours in this branch of manufacture, the higher qualities of British lace were regarded in this country as something not to be surpassed; this impression found a strong confirmation in the value at that time attached by the Parisian *élégantes* to the limited supply afforded them through the gallant intrepidity of the Kentish smugglers. Before turning to the examples of this manufacture which may be found in the Crystal Palace, let us take a brief glance at the physiology of English lacemaking. At the period of which I have just been speaking, as indeed is still the case, this employment was entirely in the hands of women and children, and was chiefly pursued in the towns and villages of Buckinghamshire and Bedfordshire. There, children at the age of five years were regularly sent to school to acquire the art. A good mistress would, even in a village, frequently have as many as fifty pupils, who paid her from a penny to threepence a week each, according to their proficiency, and the importance of the work on which their "prentice hands" were engaged. The children soon learned their art, and passed gradually through the ordeal of pattern more and more intricate, until they became thoroughly conversant with the business. The thread of which lace is made came almost exclusively from Holland, and was supplied to the poor manufacturers by a class of traders who occupied something of the position of middlemen between them and the lace merchants, from whom the retail dealers obtained their supplies. These gentlemen were in the habit of visiting the villages about once in every six weeks, and purchasing all the lace that had then been worked up, deducting from the price paid the value of the supply of thread which they left, to be manufactured into more lace by the period of their next visit. So great was the demand for it at that time, that all which could be made was eagerly bought; and even when provisions were double their present price, the labour of the wife went far to support the family. The lace was generally fabricated in rooms without a fire, the dust of which would have injured its colour, and at stated periods was cut into lengths varying from three to ten or twenty yards. So perfectly acquainted was each buyer with the quantity which could be made in a given time by each person, that, had the maker sold a few yards off the pillow to oblige the clergyman's lady or her visitor from town, the remainder was often thrown back upon her hands as a punishment for seeking another market for her wares. His knowledge, too, of the style of work of his *employées* was not less accurate, and he would be found able to detect at a glance the workmanship of each person from that of her neighbours. Formerly, every English lady of any pretensions wore caps and collars made exclusively of lace, the consumption of which was, therefore, very considerable; and, as it was regarded as a necessity for every one to possess a certain number of caps that had never been washed, the demand was, of course, constant. At length, however, Nottingham net, though originally sold at about a guinea a yard, was generally introduced; and, alas for the lacemakers, milliners adopted it for caps. Uring's figured imitations then succeeded, diminishing still further the demand for the original fabric. The general peace admitted large consignments of foreign manufacture: the coarse specimens of Valenciennes were soon pronounced more beautiful than the finest British lace, and it was soon found to be more durable, since, to compete in some measure with foreign rivals and home machinery, an inferior thread was substituted for that of a more expensive description, and the glory of the Buckingham lace departed for ever. My readers must not conclude, however, that its manufacture has by any means ceased; a considerable quantity is still made, some of which has been deemed worthy a place in the Great Exhibition; but this display is by no means large, and it is to the specimens of Honiton lace that the English amateur must point when anything like a comparison with the foreign is required. A handsome flounce of Buckinghamshire lace, of considerable width, is exhibited, with 800 bobbins attached to it. Some very pretty collars, cuffs, lappets, and neck-ties, the work of Elizabeth Prowen, of Marlow, are presented to our view in the South Central Gallery (No. 170). Mr. Hill, of Olney, has also sent many insertions, edging, and flouncing, of excellent quality. An entirely new feature is presented in some specimens of this lace, which appear (397) under the name of Mr. Hurst, of Bedford; the peculiarity consists in the introduction of spun glass in the figure: this design may possibly give a new impetus to this declining branch of home manufacture, for which it is, indeed, highly desirable that a fresh interest should be created.

Of Honiton lace, the exclusive production of England, but highly prized by the tasteful of all nations, a very elaborate display is made (also in the Central Gallery) by several lace merchants of London, among whom Biddle and Co., of Oxford-street, better known as Heywards, should be distinguished. They exhibit on a large scale the arms of her Majesty, encircled by a wreath of palm branches, with which are entwined the united rose, thistle, and shamrock, and is enclosed in a second border of oak leaves, the whole formed of Honiton lace. In the same case is a bridal scarf designed from natural flowers, and including in its pattern the rose, tulip, convolvulus, fuchsia, &c. Four medallions, which compose the centre, offer specimens of the varieties in the manufacture of this lace. A headdress, displaying the leaves of the convolvulus without flowers, also a berthe and handkerchief of beautiful although indescribable pattern, will excite universal admiration. A half-shawl, of *guipure*, made at Honiton, the property of Laughier and Cosens, is an elegant instance of this old form of dress, revived in the present day. There are in this department several specimens, in which the Honiton assumes the rich and massive appearance of the antique lace, especially point: many will coincide in my opinion, that this is its most beautiful phase; it is certainly one to which a mere description could never do justice. Of Irish laces, the examples that present themselves, though not very numerous, are of such a character as to excite high anticipations of the perfection to which the Limerick, especially, may yet be brought; they are now highly creditable to a country which has so recently adopted this branch of manufacture. Messrs. Forrest, of Dublin, contribute, among various objects a dress, with three flounces of shaded Limerick lace, which for intrinsic beauty and elegance of effect may vie with any specimen of the same description. I regret that want of space should prevent my doing justice individually to the productions of the sister island, but elegances of a more important and no less interesting character await us, and to them my attention is now due.

My personal investigation of the various descriptions of silks in the Exhibition having commenced in that department of the South Gallery entirely set aside for the productions of the Spitalfields looms, it is to them that I wish now to direct the attention of my readers. A few general words will perhaps be expected of me in regard to the rival merits of the Lyons and British manufactures: to decide on, or even properly discuss their intrinsic value and respective qualities, would require a more intimate acquaintance than I profess with the art of silk manufacture; and, therefore, impressed with a full intention of awarding the palm of merit, I will simply give my own impressions on the subject. Having been frequently informed of the great advantages possessed by the manufacturer of Lyons in his climate and water (used for the purpose of dyeing), which enable him to produce colours of a brilliancy and perfection unattainable in England, I was fully prepared to see even the best of our British silks excelled in effect by their foreign competitors. In the French department there are certainly a few plain satins and moirés, the chief attraction of which consists in their bright and vivid tints; and such are in this respect unequalled; but, as the English exhibitors have in general selected for exposition fabrics possessing so much elegance of design as to render their face dependent on colour for their beauty, the effect produced by them on my mind was the reverse of satisfaction. I think that those ladies who have from patriotic feelings systematically patronised the productions of their country, will be enabled to pursue this principle without any sacrifice of taste or inclination

I will now particularise some of the dresses and materials for dresses which appear most worthy of admiration. It will be difficult, by a written description, to present them in their individuality to the minds of my readers; I will therefore advise them to regard this sketch rather as a guide to the most attractive objects in this maze of wonders, than as a substitute for a personal inspection of their merits. In case No. 1, allotted to the contribution of Mr. Redmayne, of Bond-street, are two very beautiful specimens, in yellow and brown, of moire antique silk, which present rather a novel effect, from the introduction of satin spots: this material, I believe, is properly designated by the term *gros d'Afrique*, and is manufactured by Temple and Stone, of Spitalfields. Messrs. Robinson exhibit (No. 5) a broaded silk, the pattern of which seems at present somewhat crude, although scarcely likely to remain long so; it is a representation, on a small scale, of convolvulus, called in France *Victoria regina*. The flowers and leaves of this beautiful plant are, both in colour and form, very accurately represented, but scarcely show to as much advantage on the white ground here selected as they would be likely to do on one of a darker tone. Case 14 contains a very rich brocaded poplins, manufactured by Geoghegan, of Dublin, which, it is needless to say, are the best of their class. Some are plain, some watered, and some moire antiques; the last I must especially commend as far surpassing the other figured silks of the room. On two full dresses, arranged in glass 16, and exhibited by Mr. Dear, I shall have occasion to dwell longer than I have done on any that have yet passed under review; they are, in my opinion, almost the *chef d'œuvres* of Spitalfields art, and I must recommend them to the attention of all lady visitors to the Exhibition. They are made by Campbell and Harrison, and designed by the pupils of the Spitalfields School of Design, to whose successful progress they bear ample testimony. The pattern in both dresses is the same. It consists of bouquets of rather small flowers connected with each other, and thus forming elegant stripes. The ground is of ribbed silk, in one instance white, and in the other black, the effect in both being equally beautiful. The material appears to be of the thickest and richest texture, but entirely devoid of that stiff unyielding appearance often presented by silks of *première qualité*, which, although looking as if they could justify their own existence and certainly "stand alone," appear also likely to resist every attempt made to impart grace and elegance to their folds. I am informed that a dress of the pattern just described other has been or will be presented to the Queen, whose admirable patronage of British manufacturers has so essentially benefitted this class of her subjects.

Messrs. Sewell and Co., of Compton House, have sent amongst other objects a very beautiful brocade dress, the ground of which is gold colour and white place, the pattern various flowers with gold colour brocaded leaves. There is also a dress exhibited by Miss Clarke, of Regent-street, which presents a double claim to attention, as being rather a remarkable material, and as having been worn by her Majesty at a levee this season: it is called rainbow enamelled silk, and, indeed, as this description may be, I scarcely think I can convey to you a more ample one; the fabric seems principally composed of gold and silver, but with these are intermingled a variety of indistinct colours, from which I presume it derives its name. It is far surpassed in beauty by some dresses in the French department, of a somewhat similar description, to which I shall presently advert. In case 27 is a silk, the property of Howell and Co., the peculiarity of which is, that it is watered in the loom, or rather that the effect of watering is given by alternations of silk and satin, the narrow stripes of which follow the pattern usually given by the process of watering. On this ground is brocaded a large pattern in green and lilac. The *tout ensemble*, though it must be called

handsome, is somewhat too showy to suit the taste of ladies in general. On advancing to the compartment of Tanner and Son (No. 28), we have evidence of the important position in ladies costume to which *Par nods* are now promoted, since here and elsewhere we have many varieties of silks, the patterns and width of which prove them to be intended exclusively for their manufacture. The one specimen which attracted my especial admiration was a chiné silk, the ground white, but relieved with a perfect *parterre* of flowers. Amongst the contributions of Messrs. Carter, Vavasour, and Rix (No. 50) is a brocade dress, which, as being somewhat of a novelty as well as very pretty, it would be unjust to omit from my list: the ground is dark blue, adorned with a pattern of leaves and tendrils in gold-coloured satin; the designer appears to have been ambitious of producing an effect of more than ordinary excellence, since, not contented with the simple representation of leaves, he has also successfully imitated their shadows; this is done in gros de Naples of a shade rather deeper than that of the prominent leaf. Another division of the same case (33) is entirely devoted to specimens in various colours of shaded silk dresses, appearing under the auspices of Messrs. Marshall and Snelgrove. The shading varies from pure white to the deepest crimson, blue for green, as the case may be, and the gradations are of the greatest delicacy. The number of threads employed in the construction of each shade, or rather shaded stripe, is nearly 200: these are divided into about 20 tints in the dyeing, and are again intermixed in various proportions throughout as the colouring may require. Some of these silks are without pattern of any kind, and some have been submitted to the process of antique watering, in deference to the prevailing taste of the day: they are all very striking and elegant.

At this compartment my survey of the Spitalfields silks concludes, but at a short distance from them are contributions of the same description from Manchester, which are well worthy a passing remark. Messrs. Harrup, Taylor, and Pearson have principally devoted their attention to glacé silks, which they exhibit (No. 62) in every imaginable combination of colours. Winkworth and Procters (65) have sent very beautiful brocades. The one with passion flower leaves in yellow satin white is thought pre eminent in beauty. Before quitting finally the British department, I feel bound to observe that there are many dresses to which I have not separately alluded, which may, nevertheless, be equally deserving of admiration with some to which I have devoted a few words; but for this purpose I have principally selected specimens possessing some peculiar characteristic, as my review of them would otherwise have degenerated into a mere catalogue of colours and materials.

In the same gallery, but on the other side of the Transept, we shall find displayed the beautiful and rather extensive collection of French silks and velvets. As they appear in some instances to be irregularly numbered, and in others without number at all, it will be useless to attempt taking them in order. I will, therefore, note them down in the succession in which they met my own eye, and would probably be generally viewed. The first that presents itself is the case of Champagne and Rougier (1148), containing beautiful figured silks; two dresses, pink and green, with scarf-shaped flounces, ornamented with bouquets, are very elegant. There are also brocades of the richest quality, among which the most *recherché* are a crimson and black, and one with white ground and small palm leaf pattern in blue. We now arrive at those plain satins and gros de Naples to which I have already alluded, as claiming for their makers a decided pre-eminence in the art of dyeing: the colours especially the rose and dark blue, are most brilliant; and, by the care and taste displayed in their arrangement, are shown to the greatest advantage. At a short distance from these is a great variety of black silks, satins, and velvets, which, although not generally attractive, by no means yield in quality to their more showy companions. At No. 1134 we have rather a curiosity in the form of a portrait, in silk, of the present Pope; the colours are, of course, merely black and white, the object being as close an imitation of engraving as possible: an inscription informs us that it was woven at Lyons, in 1848, "*in segno di profonde venerazione.*" The exhibitors of this have another very attractive object in their compartment, one of the most elaborate brocades in the Building: it is a white ground, thickly covered with a pattern of delicate green; part of the front breadth, however, is woven of a much darker shade of green in imitation of a petticoat, from which the dress is represented as being looped back at intervals by bunches of flowers; the effect is admirably given, and at a distance one would easily imagine it to be one flat surface. The next in this compartment we must notice is that of Matheson and Bouvard (No. 1349), which contains a larger and more varied assortment of dresses, furniture silks, and beautiful fabrics of every description, than has been contributed by any other single house. The first objects which decidedly attracted my attention were a dark blue silk of unusually rich quality, and another of the same description in brown. The pattern is very simple, being merely a satin flower on a ground of *gros des Indes*; but they are in perfect taste, and seem designed to last a lifetime. In this change-loving age, however, I know not if this durability even in a dress be considered an advantage. Hand-some as are the materials I have just described, they completely sink into insignificance when compared with some *moire antiques* shot with gold and silver, which we find on pursuing for a few steps our onward journey. Of these dresses, the most magnificent I ever saw, there are four specimens in different colours—white, yellow, pink, and green; the last is shot with silver, and forms the most beautiful material conceivable for full dress. Matheson and Bouvard have also an extensive display of silk portents, and exhibit one o the Queen, woven by the Jacquard loom, in the construction of which 40,000 cards were employed. The *chef d'œuvre* however, of the peculiar branch of art is a group executed by Polton and Rambaud (1482), which includes her Majesty, Prince Albert, and the Prince of Wales, and is really a pleasing and successful representation. It occupied seven draughtsmen for thirty weeks, required 14,000 cards, and a loom of three large and one small Jacquard machines, the expense of which alone was 5000 francs: only three specimens can be completed in a week, two weavers being employed, who relieve each other every two hours, and a master constantly present to superintend their operations. It is certainly a curiosity, yet I think many will agree with me in deploring that the labour, ingenuity, and expense bestowed upon it had been devoted to some object of greater utility even for ornamental purposes, since the utmost praise that could be awarded would only be to compare it with a very inferior engraving.

I must not forget that some portion of my space and attention is due to the velvets, and it is in the Lyons department amongst the silks recently examin d, that we should look for some of the finest description. I must, however, confess, that with the cut velvet I was slightly disappointed. This may have been owing to the disadvantage under which they are viewed, as, with scarcely an exception, the space devoted to them is inadequate for the purpose of their effective display. The largest assortment is that of Girard (1945), which includes every variety of colour; but decidedly the most attractive collection consists of figured specimens, exhibited (1063) by Balleidier. These are all beautiful when examined; but there is one variety, the ground of which is rich white satin, adorned with a raised oak-leaf in white velvet, which could not fail to attract the admiration of every beholder; they are evidently intended for waistcoats, being too massive for the purposes of ladies' costume, and thus, but for their peculiar excellence, would scarcely have come within my province to notice. It is in the department of Sardinia, situated on the ground-floor at the eastern end of the Building, that we must now proceed in search of the finest quality of velvets, as well as of the greatest novelty in their construction. This consists in the introduction of a beautiful imitation of white lace, three rows of which running, lengthwise are woven in silk on the velvet: the exhibitors of this exquisite material are J. Guellot and Co., of Turin and Genoa. The colours selected are blue, black, and brown: the lace pattern with which they are adorned also varies slightly; for the blue, a light floral pattern has been chosen, the effect of which is very elegant; for the black and brown one of a somewhat heavier description, resembling Honiton point. There can be but one opinion as to the unrivalled beauty of these dresses; and, as individual taste may be consulted in their details, there is little doubt that they will be eagerly adopted by ladies who study effect rather than economy in their attire.

In conclusion, I may, perhaps, be admitted to observe, that, although I have confined my attention exclusively to silks, which in the present display are so distinguished for richness and novelty, there are, throughout the Exhibition, numerous specimens of more unpretending materials, which have their own peculiar claims. In reference to their comparative merits and attractions, I can only say, with an Elizabethan poet—

> Ye meaner beauties of the night,
> That poorly satisfy our eyes,
> More by your number than your light,
> Ye common people of the skies,
> What are ye, when the moon shall rise?

In my next paper, I propose to notice a greater variety of objects interesting to ladies; but, as silk and lace form so considerable a part of the attire of my countrywomen, it seemed due to them, no less than to the subjects, to devote a proportionate space to their description.

HOROLOGICAL SECTION.

(FOURTH NOTICE.)

THE first object which struck us on the fifth table was R. Webster's Continuous Remontoir Clock, which is constructed to show a new principle of continuous remontoir. It may be well to remind our readers that a remontoir is a movement by which the impulse is given to the escapement by means of a small separate weight or spring, independently of the force of the train wound or lifted up by the maintaining force at every beat, or given number of beats, of the pendulum, so that the inequalities of the force of the train do not affect the impulse on the pendulum. Some of the train remontoirs hitherto constructed have caused considerable friction on the 'scape wheel arbor, and have been wound up every twenty or thirty seconds; so that, whether a spiral spring or weight has been used, the power applied to the escapement has varied during the interval between one winding up and another. In the present instance, this defect has been overcome by winding up the weight or spring at every vibration of the pendulum by means of magnetism, which also prevents the objectionable friction on the 'scape wheel arbor. The above remarks apply to train remontoirs, in contradistinction to remontoir escapements. There are several means by which this new principle is applicable. In the present instance, magnetic repulsion acts in the plane of the pendulum's vibration. Two escapements are used—the one to give impulse to the pendulum in the ordinary manner, and the other to wind up the spring or weight attached to the 'scape wheel arbor. The impulse escapement is an ordinary dead beat, the remontoir escapement is a pin wheel. A magnet is attached to the pendulum, a short distance from the point of suspension, and a second magnet is also fixed to the pallets of the pin wheel escapement. The action of this contrivance may be thus described:—When the pendulum vibrates, either to the right or to the left, one of the poles of the magnet on the pendulum approaches one of the poles of the magnet on the pallets: and, as the north pole of the one is opposite to the north pole of the other, repulsion takes place and allows one tooth of the pin wheel to escape; thus the maintaining force is applied to wind up the remontoir, which has been unwound to the same extent during the same period.

119. J. Radford, of Cheltenham, exhibits a design for a geographical clock, watch, or chronometer.

41. F. Walter contributes a clock of new design, on the face of which are painted extracts from the Holy Scriptures.

57. In addition to the chronometers, watches, &c. exhibited by Mr Charles Frodsham, of the Strand, there is an astronomical clock, on bracket, in carved case; also a regulator, the minute-hand central, the seconds-hand and hour hand respectively excentral: the hours are marked to 24.

Mr. G. F. Hall exhibits his astronomical and meteorological regulator, with micrometer adjustment for temperature

Robert Roskell and Co., of Liverpool, exhibit a fine display of clocks and watches, in addition to 24 ladies' and gentlemen's watches, in gold cases. We find on one side of the case:—1. The model of a skeleton clock, with double pin escapement and gridiron pendulum. 2. A similar clock, but with dead seconds escapement. 3. A small portable clock. 4. Model of a skeleton clock, with dead seconds escapement and glass pendulum. 5. A large model of a watch, with glass face, to show the works: this has a chronometer escapement. 6. A similar model, but with verge escapement. On the other side of the case are: 1. A hand-some portable clock. 2. Model of a skeleton clock, with Graham escapement. 3. A similar model, but with pin escapement and mercurial pendulum. 4. A large model of a watch, with duplex escapement. 5. A similar model, but with horizontal escapement. On the east side of the same case is a large skeleton clock, which strikes on eight bells, and spiral resonant spring; a quarter clock, with recoil escapement; a chronometer; a large model of a watch, with detached lever escapement; a large model watch, with glass face, having double balance-wheel escapement; a chronometer movement; two small skeleton clocks, one with the two-pin escapement, the other with anchor escapement; also two other large models of watches, one with *virgule* escapement, the other with double wheel chronometer escapement. Altogether forming a series of beautiful examples of horological work as executed by these spirited Liverpool exhibitors at the World's Fair.

169 Small square clock, in glass case, by A. Gerard, of Aberdeen.

George Taylor, of Wolverhampton, exhibits his Perpetual Self correcting date clocks; the day of the month, the month, and the day of the week are all shown in recessed openings under the dial.

94 For cheapness of production, Thomas Boulton, of Coventry, exhibits eight-inch plain silver watches; the prices, however, are not indicated, so that we cannot form an opinion as to how far Mr. Boulton has succeeded in his object.

67. A small old skeleton clock is contributed by E. J. MacDoual, of 12, Dorset-place, Pall-mall East

87. J. H. Allis, of Bristol, contributes a large ornamental bronzed clock, with central minute-hand, the hours and seconds excentral. This arrangement is now very common, but, for actual utility, we far prefer the second-hand to be central.

An ordinary-looking clock, with self-regulating barometer attached, is contributed by Messrs. Bryson, of Edinburgh

95. J. Brisdall, of Birmingham, exhibits a one-month clock. In addition to the ordinary dial, it has an almanack attached, and is self-regulating, so far as the regular months are concerned, and also the extra day in Leap Year.

92. John Blaylock, of Carlisle, contributes his improved mode of self-regulating the supply of gas to illuminated clock-dials, daily increasing or decreasing the sectional area of the cock for the supply, according to the season of the year; the only attention required being on the longest and shortest days, at which times it is necessary to reverse the action of the machine.

73. Payne, of New Bond-street, whose pedometers are now so well known, exhibits, in his own case, sixteen different clocks of various designs, some of which are in elegant cases, while others are known as "imperials" for carriages.

J. Drury contributes a plain round dial, without any pretensions to much novelty.

100 Skeleton clocks are in great vogue at the present time, as is evident from the large number contributed by so many of the British and French exhibitors. Two of these are added by Dell Brothers, of Bristol, who also exhibit two glass dial-clocks, on pedestals, similar in appearance to those from Prussia already mentioned; a pendulum clock completing their assortment

100. An old-fashioned octagon-faced clock, with three-quarter columns and pediment.

69. Here is another instance of working-men spending much of their time and hard-earned money in order to contribute some specimens of their skill to the present Exhibition. On looking at the table set out for the display of their inventions, at the back of Smith's large turret-clock, it will be observed that several are in an unfinished state, and, sad to relate, one of the brothers, Henry Mapple, a very ingenious, hardworking man, formerly in the service of the Electric Telegraph Company, who had been engaged day and night to complete his productions in time for the opening of the Monster Show, became insane about the beginning of May. The articles completed by D. M. Mapple are an improved lever escapement, a small skeleton clock, a marine timekeeper, and a small clock in black case.

130 In addition to Mr. Roberts' "Alpha" clock, exhibited in the West Gallery, this gentleman has also contributed to the Exhibition six other inventions in the Horological department. These are—the dead centre seconds lever watch, the "Recorder," the normal drill; the synchronometer; the wheel sector; and the decimal gauge for sizing the pillar-plates of watches and chronometers. First, the dead centre seconds lever watch has one train and remontoir, the spring of which, being similar to the balance spring, compensates in some degree for the effect of the change of temperature on the latter: and the unlocking of the detent being effected by the escape-wheel, after it has impelled the balance, does not interfere with the correct performance of the watch, whether it has a going-barrel, as in this instance, or a fusee train of 14,400. Second, the "Recorder" watch, having a going-barrel, lever-escapement, and remontoir, beats semi-seconds with a train of 14,400. The "recording" circle of this watch is furnished with hands for minutes and seconds, which are put into or out of action by pressing simply the *pusher* into the pendent. As the impulses are given to the balance before the unlocking of the train takes place (as in the centre seconds watch), the accuracy of the time-keeping of the watch is not affected by the recorder being in action. Third, the normal drill is adapted for drilling all the pivot, screw, and steady pin-holes in the frame plates of watches, chronometers, and small clocks, with much greater despatch and accuracy than is done by the present mode. A boy of fifteen years of age may, by this machine, drill any number of watch-frame plates so precisely alike, that the parts that fit one of the frames will fit all or any of the others. This is decidedly a great and valuable addition to clock and watchmakers' tools. Fourth, the model of a synchronometer is to show, that, by the application of pneumatics, a clock may be made to indicate simultaneously the time of day on dials in various places at a distance from each other. Fifth, the use of the wheel sector is to ascertain with great accuracy the normal and pitch-line diameters of wheels and pinions of any pitch and number of teeth respectively. The inventions we have described as above are all patented by Mr. Roberts. Finally, the same gentleman exhibits a decimal gauge for sizing the pillar plates of watches and chronometers. The increments on this gauge are one-tenth of an inch each, and correspond with the scales on the normal drilling machine, one of which is adapted for a five-inch standard plate for watches, the other for a six-inch plate for chronometers.

139. Mr. Villiamy contributes the model of a powerful pendulum for turret clocks, half the size of the original, having a very firm support, and without spring or crutch, a very small amount of friction, and, consequently, little variation in force.

ENGLISH BOOKBINDING.

IN our previous notice of this art we censured what we considered the affectations of the English bookbinders: let us now see what we can say in their praise.

Remnant and Edmonds, among many excellent examples of publishers' binding, send a "Horace," sweetly bound in white vellum, with the ornament of a fine classical character, and "Crabbe's Poems," in olive-coloured morocco, decorated with a pleasing combination of lines. We like Messrs. Barrett and Co's small Prayer-books better than their large Bibles. John Wright sends the best specimen of inlaid work on vellum, "Des Niebelungen Lied;" the gold, and orange, and purple lines give a rich and pleasing effect, and the design is excellent. We like also his large book, "Low's Domestic Animals," well covered with gold and tooling: the tooling" is as good as it can be. Among Mr. Macome's collection we admire the workmanship of the "morocco bub' Bible: it has a large gilt metal side let into the morocco so as to be perfectly flat: this is a novelty, and praiseworthy; we admire the ideas and execution of the work more than the design of the ornament, which is rarely suitable to a Bible. The same may be said of his classically-bound Bible, which otherwise is a good example of workmanship. Evans' copy of Mr. Willement's book-cover (from Shaw's work) deserves much credit: the pattern is coloured and enamelled, as it were, on white leather; it is carefully done, and the effect is very good: we may also praise the inside lining, which is appropriate in style and well executed. We like, too, the appearance of the album in white vellum, ornamented with roses: of its class it is a pleasing specimen. Batten, of Clapham, sends a "Shakespeare," in white vellum, ornamented with red and light-green; "Moore's Irish Melodies," in morocco richly inlaid, and a large volume well covered in gold, all of which we think highly of.

Orr and Co. have a neatly ornamented copy of the "Gallery of Nature," and also exhibit the cover of "Chambers' Papers for the People," which, of its class, is the best book-cover we know. It bears evidence of being designed by that clever ornamentist, Mr. Owen Jones. Josiah Westley's best books are "Spenser's Works," in white vellum, with lines of pale blue, making a delicate and pleasing pattern, and a quarto Prayer-book in brown morocco, with a very good inside lining. We like much the broad side border stamped in gold on white card-board.

Binns and Goodwin, of Bath, send a copy of their "British Grasses," bound in red morocco, inlaid with white vellum, and elaborately decorated.

Leighton, of Brewer street, contribute a large variety of books in every stage of bookbinding. They have engaged an artist, "Luke Limner," to superintend the ornamental department of their business, and we find traces of his hand in all the best specimens: these to our mind are "Moore's Irish Melodies," in green morocco, with a "shamrock" diaper; "Horatius" and "Macaulay's Lays of Ancient Rome," with good classical ornaments well applied; "Beattie's Works," in a rose-pink morocco; and the "The Pilgrim's Progress;" "Milton" and "Thomson's Seasons," bound in calf, with pleasant-looking artistic designs painted on them by Luke Limner.

Mrs. C. Lewis exhibits a good Grolier pattern on the "Sheriffs of Lanark:" and we like the simple treatment of the "Bibliotheca Heraldica"

Hayday's best specimens are the "Rules of the Walton and Cotton Club," in green morocco, inlaid and richly gilt; "Legends Catholics," in a rich Gothic pattern; and little red volumes with broad gold borders, most accurately worked, and the gilt enamelled metal binding of "Choice Examples."

Leighton and Son exhibit many good designs for publishers' work. The "Boy's own Book" and "Evangeline" are cleverly treated; and we like "Christmas with the Poets" and the "Book of Hours." We have already commended Mr. Tarrant's single specimen, "Sir T. Lawrence's Work."

Harris, of Perth-street, sends a quarto and a thick 8vo volume in brown morocco, extremely well treated in blind-tool; his tree-marbled calf-books are excellent.

Mr. Budden, of Cambridge, shews a Bible well ornamented, and an album in vellum, inlaid with coloured leather is in a good, bold design. The work is extremely well executed. Let us not omit to praise the inside lining of white vellum, sweetly decorated with lines of colour, it looks extremely rich and pleasing.

Mr. Wiseman, of Cambridge, exhibits a good-looking Bible in red morocco.

Mr. Neil, of Edinburgh, sends a Bible, "designed and executed after business hours, by gas-light, by a self-taught individual." We cannot praise the design, but the workmanship is creditable.

Macnair, of Glasgow, has bound "Milton's Poems" very nicely in olive-coloured morocco.

A Bible, by N. Sapsford, is too elaborate to be passed without mention. Raines has two or three well-bound books: the ornament on "Illustrations of Walton" is pleasing and well executed; that on the large "National Gallery" is rich looking, but not quite accordant.

Mr. Riviere's four volumes we commended in our previous notice, and Messrs. Bone's display of cloth-work.

The best bound books in Messrs. Westley's case are "Nineveh and Persepolis," "Ruskin's Stones of Venice," "The Town," and "Wordsworth's Poems" in white morocco, richly tooled. We feel quite sorry to see such excellent labour so misapplied on their large Bible.

The display of Russia ledgers and account books of all sorts is very excellent.

MANUFACTURING MACHINES AND TOOLS.

THE display of manufacturing machines and tools included in Class 6 is situated on the east side of the second-class refreshment-room, and immediately on the north side of the locomotive engines and other railway plant, and is worthily represented by the celebrated houses of Whitworth, of Manchester; Parr, Curtis, and Madeley, and Sharp Brothers, all of Manchester; and Messrs. Shepherd, Hill, and Spink, of Leeds. The first-named firm are naturally the largest exhibitors, and contribute a complete series of their beautifully-finished self-acting lathes; as also their planing, slotting, drilling, boring, screwing, cutting, dividing, punching, and shearing machines respectively. Most of these machines may be seen daily in action in connexion with a steam-engine erected by Messrs. Whitworth, solely with a view to enable visitors to understand the actions of the different machines. We have already illustrated (June 21) two of Messrs. Parr, Curtis, and Madeley's. The others are the shaping and drilling machines respectively.

The general shaping machine, which is used for the purpose of cutting out and forming hollows in metals to half an inch radius, and generally for shaping metallic work, either plain, angular, circular, or polygonal. The novelty of this machine consists in the introduction of a pair of eccentric wheels which give motion to the crank, thus effecting a more uniform motion when in action than usual in such machines.

The fourth manufacturing machine of Messrs. Parr, Curtis, and Madeley is one much used for drilling holes in metal, up to 1½ inches diameter. It is supplied with a self-acting feed motion; the pressure being regulated either by a friction-brake of improved form, or by the operator himself

Finally, Messrs. Shepherd, Hill, and Spink contribute a self-acting lathe and screw-cutting apparatus, self-acting surface motion, and improved disengaging motion. It will be seen, on examining these various machines, that the great difference between them is the superior finish by which one set of machines is distinguished from another.

THE SHILLING DAY.—GOING TO THE EXHIBITION

FIVE SHILLING DAYS AND ONE SHILLING DAYS.

THE day of the great folks, and the day of the little folks—the day of the peach-coloured *visites* and the gaudy mousselaines de laine, and the day of the cotton prints and the handkerchiefs at 1s. 11½d.—the day of the shiny boots, and the day of the uncle jacks with hob-nails—the day of the newest paletot, and the day of the most primitive smock-frock—the day of vanille, ices, and wafers, and the day of bunches of crust and lumps of meat and liquid refreshments in small bottles—the day of languid lounging and chatting, and the day of resolute examining and frank amazement—the day of the West-End of London, and the day of all the other ends of the earth—the five shilling day in fact, and the one shilling day, come—pass each before us, with your votaries; exhibit each your phenomena and your usages; introduce us each to your train of company; tell us, each, your comparative value; read us, each, your separate lesson: for you have and you present, each of you crown day and twelvepenny day—your distinct train of appendages and characteristics. Sunday in the world is not more unlike Saturday, than Saturday in the Exhibition is unlike Monday. On one day, society—on the other, the world. On the one day, the Nave crowded in such fashion as opera corridors and Belgravian saloons are crowded, and the aisles and galleries empty. On the other day, the aisles and galleries crowded, and the Nave a thoroughfare—a street—swarming, bustling, pushing with loud voices and brusque movements; and people who have sharp elbows, and can use them, and who push along as in Fleet-street or in Cheapside, intent upon going somewhere, determination in their muscles and purpose in their eyes—the energetic business-like march of this energetic business-like nation.

And first—as they have had their earlier innings in the great game of the Exhibition—we take the five-shillingers. On Saturday St. James fairly ousts St. Giles; the latter worthy, but unfashionable saint, taking, however, ample revenge on at least four other days of the week. As becomes his gentility, St. James, upon his particular morning, gets up late, and ringing for his valet, looks over the morning packet of cards and letters, announcing "at home" and, in the vernacular, "dancing teas," when, after profoundly meditating on how he intends to "employ each shining hour"—whether he will lounge away the day in the Club or the sweet shady side of Pall-mall, or whether he has any paste-boards to leave, or whether he shall fly from the gauds of the world, which are vanity, and solace himself, with a quiet stroll through country elms branching over the greensward, winding up with a dinner at the Toy or the Star and Garter, which is also vanity, but never mind that the brilliant idea perhaps strikes him that he will order out his cab, or saunter across the Park, and while away the hours in the "Palace:" as he imagines so does he act. Loungingly and listlessly does he mark

THE SHILLING DAY.—EXTERIOR OF THE EXHIBITION.

AGRICULTURISTS AT THE EXHIBITION.

that singularly tall flagstaff, with that very small flag—large pocket-handkerchief size—which graces or does not grace the southern summit of the Transept. Lounginglly and listlessly does he saunter across the magic threshold, and leave behind him the treasure of his autograph in a beautifully gentlemanly scrawl, backed by a high-life flourish or an aristocratic blot; and then, gazing around with a calm grace of patronising dignity, and an expression indicating that, "by Jove, the thing is very well in its way," he silently loses himself in the lightly rustling, and gaily but lowly talking throng of promenaders. No eagerness, mark you; no flutter of curiosity; no immediate plunge into one of the departments, irresistibly seduced by malachite, or statues with lace on their faces, or beds which look like young cathedrals. Why, he has seen all these things before. He has not missed a single day, from that on which her Majesty walked forwards and the Lord Chamberlain walked backwards from England to Canton, and from Canton to New York, until, of course, until the irruption of the shillingers broke into what were becoming his daily habits, and for a space turned him out. Do not let us lose him, however. Mark how the Saint, in his light paletot and glazed boots, saunters observingly through the perfumed throng. He has already nodded to a score of people, and said, "How do? Fine day," to a dozen. Then he strays from party to party of the gayest lady-birds under the glass. He loses himself in the accustomed ocean of small talk about balls and parties and concerts and operas, and all the *piquant* scandal and all the staler gossip of the great world. He wonders what they are going to do with the Building; he wonders whether they will let people ride in it. He don't suppose they'll stand drags. He wonders if they'll keep the organs in, and the Crystal Fountain. He wonders where that sparrow is, that they say is in the Exhibition. He wonders whether any new things have come in since last Saturday. He understands that So-and-So has purchased so and so, and that Thingamy has given an order for a duplicate of what's its name. He wishes they had made the Building all arched, like the Transept. He'd have done it, if he had had anything to do in the matter. He finds it very hot; but believes they say it is hotter in the gallery; and wonders why Mr. Paxton don't find some means of cooling the air, icing the fountains, or driving a cold blast through the organs, or something of that sort. Now and then, with a couple of ladies on his arm, he may saunter carelessly into France or Austria, to see the prettinesses of furniture and decoration. Lady Jane wants to look at a candelabrum for the dining-room in Park-lane, or the Hon. Mrs de Smythe, wishes to secure a glittering piece of marqueterie for the drawingroom in Belgravia or Tyburnia. In some cases, the jewellery has still lingering charms. The nose of the unhappy Koh-i-noor has been dreadfully put out of joint; but there are Hope diamonds and black diamonds, and marvellous emeralds and amethysts, which still reflect in

THE FIVE SHILLING DAY AT THE EXHIBITION.

their precious depths the translucent eyes which sparkle over them. Or does he wonder musing St. James encounter a county family "up to the Exhibition," and gravely staring and wondering at all around them, then, perhaps, he good-naturedly unbends, and for some brief space becomes pilot and Cicerone. He points out the geographical localities in which he is notably guided by the placards, and knows were the French House, the Gobelins, tapestry room, and the Austrian furniture room where the young cathedral is, and the Mediæval court, in which, as is possible, he be affected with the moral and mental tinge if, as is which was once young-England. he discourses with tolerable learning of ecclesiology, of vestements and stoles, screens and fonts, and becomes in his discourse highly picturesque and medieval, to the great bewilderment of the county family, who don't in the least understand the difference between the early English and the *Renaissance* is anything to *Rondoyaud* styles, and wonder whether the *Renaissance* is anything to eat And talking, by the by, of eating, or rather that genteel apology for eating which is provoked by lees and wafers, St. James and his kindred five shillingers much affect the refreshment departments, where they lounge upon the softest benches get-attable, and turn their stomachs into arctic regions, with small strawberry and lemon icebergs, or make the climate milder with floods of coffee more, or less mild, mated by the chicory beloved of the Chancellor of the Exchequer. And so the day wears on. Nobody looks at anything in particular— unless it be somebody else. Ladies let the steam-engines alone, but cr.tique ladies' bonnets. Pretty things in handy place—come in for unlooked inevitable praise. People ask whether they will meet other people at balls and operas in the evening. People point other people out. Here and there a single lady and gentleman wander coolingly down love alleys of broad cloth, or streets of glittering guns and pistols—not however criticising the excellence of either. The sisters in the Bath chairs are almost the only active inspectors. Round and round they go, pushed by perspiring Frenchmen, and eagerly making the most of their limited time. They do not like to brave the grand crash, but wander in aisles and compartments, and continually pull up to gaze and admire. Meanwhile the grand crowd still ebbs and flows and circles round the fountains and the statues and the organs. Look at it from the gallery. What a glancing bed of peripatetic flowrets pinks and roses, and lilies and carnations—all a blowing, all a growing, and, what is stranger still, all a moving, all a fluctuating. Hither and thither in eddies and streams and counter-streams, a kaleidoscopic parterre of brightlues and tints shifting and blending and intermingling like living shot-silk—the congregated essence of a half score thousand male and female St. James's.

But now for the Shillingers. Now for sturdy St. Giles—whether from the town or country, whether he trudge Hyde Park-wise from the backwoods of Hackney, or the savage prairies of Walworth, or whether he come smock-frocked and hob-nailed from the agricultural districts, or whether a club and a cheap train have fetched him for a day from his power-mate at Manchester, or his lace frame at Nottingham, or his grindstone at Sheffield, or his anvil at Birmingham. Up sturdy St. Giles, and see the work of men's hands—see what the toilers and the delvers and the hewers of wood can do, and give each the credit, finger or brain, which belongs to him. And St. Giles, whether agriculturalist or manufacturing—whether fresh from country hedgerow, or fusty from City lane—call up Mrs. St. Giles, and all the little St. Giles', not even forgetting the St. Giles baby, who will alarm the whole parish if he be left alone and who happily does not count at the shilling turnpike. Up with you early for the train perhaps, early for the walk, all in a flutter at the brave things before you. Don Sunday clothes, the cleanest smock-frock, the best bonnet, the dcent velveteen, the palest corduroys, or, it may will be, the decent broadcloth coat not *distinguished* perhaps in what St. James would call the "tone"—but a proper garment, significant of self-respect and industry. And Mrs. St. Giles—thanks to the machinery which you are going to see—you have been able at moderate cost to dress Sarah Jane and Mary Ann out as brightly and as flauntingly, if not as richly, as ever a Lady Arabella or a Lady Blanche of them all. To be sure, cottons from smoky Manchester print-works are not alike graphic as well as an industrial distance between Paisley and the Vale of Cashmere. Never mind; Coventry has sent its cheapest ribbons, and Nottingham its most economic stripes of lace; and you will play no bad part in the coarser but not the dingier flower-bed. An hour about! forget that. Cut the hunches of bread—no! and the bunches of bread—no! Vauxhall sandwiches are these; and pack the sausage, or the bit of cold pie, or the slices of cold pudding, in that greasy newspaper; and stuff the bundle into the handkerchief, or the basket, and so on.

St. Giles is waiting at the door long before the opening chime of ten has rung. He is there with his friends and his household—bundle in hand and shilling in hand; through the glass he catches glorious glimpses of fairy-land. Mrs St. Giles is sorely scowled upon, and "squeeged" to an inch of her life, and the small St. Giles's go lost between tall people's legs. No one grumbles. Every one anticipates. Every one stands on his tiptoes—mental and material—until chime goes the magic hour, down fall the barriers, round go the turnstiles, and the congregation of St Giles's, masculine, feminine, and counting the babies, neuter, stand agaping and wondering in Industrial Fairy-land. First, what a time of sheer pure vacant bewilderment! St. Giles has never heard the phrase *embarras de richesses*, but without knowing it, he feels its meaning where to begin, what to look at the closest. He struggles first, what to look at most, and what to look at the closest. He struggles mechanically into the Transept. The eastern sun is flashing through the long avenues of glittering industry and art, over sparkling jewellery and god-like statues, and every trophy and every triumph of the beautiful and useful, the cunning brain and the nimble fingers, and poor St. Giles stands petrified in the midst of elaborate chaos. Then, possibly, he bethinks himself of his own trade, and begins to wonder how it is represented Gradually the smock-frocks draw off, and fit, like dingy ghosts, among pulverisers and cloid-crushers. The mechanic, in a white, tight-fitting jacket, flies to the machinery in motion, like a needle to a loadstone. Weavers, silk and cloth, find out instinctively the regions fitted up by Lyons and Spitalfields, by Yorkshire, the West of England, and the Zollverein. Workers in wood, and in iron, and in stone, find the most congenial subjects for criticism in their own crafts; and accordingly, from the metropolitan, "as how it's jolly hard work, and no mistake"—some one drops a sly hint about the dinner, which St. Giles knows is the only thing which will have the ghost of a chance of interesting Mrs. St. Giles from the Valenciennes, the Honiton, and the Mechlin.

Dinner, then, in all manner of quiet holes, and nooks and corners. A great untying of handkerchiefs and distribution of viands, and strange whiffs of rum and gin, borne upon wandering zephyrs. "Four cheese, bread and cheese, and wafers! Pork, pork," says St. Giles contemptuously, giving another deadly bite to the Brobdignag sandwich. Amusing to watch the diners' genuine, unadulterated, thorough enjoyment Here, St. James, what would you give for an appetite like that? Nay, Lady Blanche, don't turn that exquisitely-chiselled, that ethereal expression—nose, because that hearty, wholesome dame did smack her lips so vigourously after the stout out of the stone bottle, or because that thin little pinched woman, who looks as if she had had all her blood sucked out of her by leeches, modestly turns a round to that tapestry or under the leg of the bensalier, applies an upturned phial to her mouth. Eat and drink, good folks all; refresh yourselves for the sight-seeing pillage. Plenty to gaze at yet before you—miles of galleries and avenues to walk through; and remember, there is young St. Giles—the dog is no light weight up and down those side aisle stairs.

After dinner, and the scene is busier still. Humble, earnest, curious people are yet pouring in in continued streams from every turnstile. Groups of girls go giggling along together, and are only brought back to admiring gravity by the sight of fine clothes. Boys whistle to their comrades like so many Roderich Dhus; young gentlemen in the gallery "hallo," or, as they pronounce it, "holler," to young acquaintance in the Nave; juvenile St. Giles, getting latterly in consequence of having been lost, are taken in the kindion by benevolent policemen, who don't like being made dry nurses of, and would rather have a thief any day like being made dry nurses of, and would rather have a thief any day like being made dry nurses of, and would rather have a thief any day

NEW BOOKS, &c.

SAM SLICK'S NEW WORK.
Now ready, in 2 vols., 21s., bound,

THE ENGLISH IN AMERICA. By the Author of "Sam Slick."

THE Ladies' FRIEND

ROWLANDS' AQUA D'ORO.—This is the most elegant and refreshing Perfume ever yielded by the "Seals of Flowers." It revives us fresh and delightful sensations of fragrance. It is invigorating, purifying, and cooling to the skin, and removes all unpleasant effects from fainting fits, fatigues of dancing, excursions, &c. Used in over-crowded rooms, or intense summer heats, its cases cannot be too strongly recommended. Price 4s 6d per bottle. Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and by Chemists and Perfumers.

N.B.—A Golden Fountain of the Aqua d'Oro is exhibited at the Crystal Palace.

NEW MUSIC.

MISS CATHERINE HAYES and Mdlle. JENNY LIND.—The most favourite ENGLISH BALLADS sung by the above distinguished vocalists are, "Always with me," by Maynard; "Oh, sing to me," by Osborne; and "To be beloved again," by Linley; sung by Miss G Hayes. "O summer morn," by Meyerbeer; "The Swiss Boy," by Bass; and "Take this kiss," by Benedict; sung by Mdlle Lind.

CRAMER, BEALE, and Co., 201, Regent-street and 67, Cornhill.

THE 1851 PRIZE SONG.—The VESPER DIRGE sung by Mr Sims Reeves, composed by Mr. EDWD. LAND. The charming and effective Song gained the prize at the Hullah Classes, 28th May. Price 2s. A part passage from ARMSTRONG and HOLLIER, 210, Regent-street, where may be had, by the same composer, "The Mariner's Dream to me," by Osborne, and "To be beloved again," by Linley; sung by Miss G Hayes. "O summer morn," by Meyerbeer; "The Swiss Boy," by Bass; and "Take this kiss," by Benedict; sung by Mdlle Lind.

CRAMER, BEALE, and Co., 201, Regent-street and 67, Cornhill.

MUSIC.—There is not any other house in Europe who can offer such a list of valuable publications as the Messrs. COCKS, Burlington-street, London. "The brave has for many years taken the lead in Musical Publications, and everything they publish is selected with the greatest taste, judgment, and at once commands an extensive popularity. The stock of engraved music plates in the possession of this house, we have authority for saying, is unequalled by any other publisher. The extensive catalogue contains every possible variety of music, from the most elevated style of science of sonatas and symphonies. These catalogues may be had gratis and postage free.—Vide Life of Man Thursday.

CHURCH MUSIC.—Just published, a COLLECTION of NINETY-THREE CHANTS, for the use of the United Church of England and Ireland; compiled by JOHN BISHOP, of Cheltenham, with copious and very practical remarks. Vocal Score, with Organ Accompaniment, price is 4d 2 inches. Published only by Messrs. ROBERT COCKS and Co., 20, her Majesty's publishers, New Burlington-street. To be had of all musicsellers and booksellers.

OPERA.—Her Majesty's Theatre and the Royal Italian Opera, Covent Garden.—Pianos, Stalls, and Boxes at CRAMER, BEALE, and CO'S, 201, Regent-street; and 67, Cornhill-street.

PIANOFORTES.—CRAMER, BEALE, and Co have the best of every description, English and foreign, new and second-hand, for sale or hire.—201, Regent-street, and 67, Cornhill street.

MERCHANTS, SHIPPERS, &c., are respectfully invited to inspect the warehouses of Messrs. ROOKS and Co., 6 New Burlington-street, London, where will be found an excellent stock of superior PIANOFORTES, from 22 guineas upwards, manufactured by the first makers in the trade. Their Patent Full-Headless, likewise, will be found to exceed, in excellence and number, those of any other house in Europe. Catalogues of instruments and music to be had gratis, and postage free, on application.—N.B. Pianofortes carefully packed for shipment, with all expedition.

TO THE FAMILIES AND RELATIONS OF CLERGYMEN AND OF THE WIVES OF CLERGYMEN

Sold only at CHARLES GLENNY'S Hosiery Warehouse, 23 Lombard-street

NICOLL'S PALETOT for the SUMMER MONTHS.—New Paletot, Mixed Pale Ale, Silk and Gossamer Paletot, also Nicoll's Paletot Shirt which is pronounced to be the most effectual protection against the heat of Summer, price One Guinea

THE REGISTERED TROUSERS are the same price; also the new MORNING COATS are only Four Guineas each.

The manufacturers of NICOLL'S REGISTERED PALETOT (kept ready for immediate use) are too well known to need any description here

H J and D Nicoll, Merchant Clothiers, Paletot Patentees, &c., 114, 116 regent-street, 22 Cornhill, 2, where measurements are kept for London and their agents in various parts the lining of each garment. They have, however, Agents who sell for them in all parts of the Kingdom, and the Continent.

IMPROMPTU DINNERS.—At Ten Minutes' notice, a set of stone chaste, consisting of Soup, Fish, a Joint and Entrée, can be served up to Dinner by means of RIDGE and CO.'S PATENT PORTABLE STOVES, which combine economy with the greatest simplicity, and will cook a perfect dinner for a family of ten persons, or for a smaller number in proportion. Each stove is packed in a portable box, and can be forwarded to any part of the country, or to the Colonies, per Railway or Steamer. Ridge and Co.'s Stoves are also admirably adapted for Yachts, Steamers, Boats, Tents, Invalids, Travellers, Shooting Parties, Picnics, &c., as they can be used with equal facility in a room, in the open air, in a carriage, or on board ship. They are made in various sizes, and may be had of all Ironmongers, Furnishing Ironmongers, and Stove Grate Manufacturers throughout the Kingdom. Ridge and Co.'s Patent Portable Stoves may be seen in operation at their Manufactory, 4, Bridge-street, Westminster, and at the Establishments of all the Furnishing Ironmongers in the Metropolis. Illustrated Lists of Prices may be had on application.

Ridge and Co.'s Patent Portable Stoves are made to burn Coke, Charcoal, or Coal, and are fitted with Ridge and Co.'s Patent Smoke-consuming Apparatus

GOTHIC MANTEL-PIECE BY WYNNE AND LUMSDEN.

(Continued from page 102.)

reconcile tastes. The exceptions, however, are, we believe, of small consequence; and if a little natural feeling has been excited, and a disposition to, perhaps, an excess of liberality created, we are inclined to think that the trifling exception will confirm the general rule, and we will have to say with Shakspeare, "All's well that ends well."

We have last to mention one minor inconvenience, which has resulted from the same individuals being Exhibitors and Jurors. By the rules of the Commissioners such parties are precluded from receiving premiums; and we are aware of more than one instance in which this will be doing injustice to pre-eminent merit.

MARTINUS SCRIBLERUS.

SILVER SALTS LAMBERT AND RAWLINGS.

GOTHIC MANTEL-PIECE. BY WYNNE AND LUMSDEN.

Messrs. Wynne and Lumsden exhibit a very fine specimen of oak carving, being a Mantel-piece for a gentleman's mansion, whose arms are represented in the centre. It is a Gothic design, the merit of which is attributable to Mr. H. Crutton, the architect; and the execution shows some of the most careful and finished workmanship ever bestowed on this material

FIRE-PLACE. BY HOOLE AND CO.

Underneath, we give an Engraving of one of the very handsome Fire-places of iron and or moulu exhibited by Messrs. Hoole and Co., of Sheffield. The design, which is of the *Renaissance* period, is very pure and elegant, and the execution the

FIRE-PLACE.—BY MESSRS HOOLE.

perfection of metal casting. We understand that it here pears just as it came from the furnace, no file or implemen any kind having been applied to it. The spectator will fail to remark the peculiar colour of the cast-iron portion the work, which present almost the effect of bronzing, which we understand is the result of a number of experim made by this firm in the fusion of metals, whilst it is sco from oxidization by the application of a transparent fluid, w was suggested to them by Mr. Hunt, of the Museum of P tical Geology. The discovery is new and useful, and ca extensively applied to objects of every day use.

GOTHIC NICHE. BY LANE AND LEWIS.

Amongst other very beautiful specimens of carving to be f in the Building Court is a canopied Niche, containing a st

GOTHIC NICHE.—MESSRS. LANE AND LEWIS.

of St. Peter, designed and executed in Caen stone, by H Lane and John Lewis, of Clifton, near Bristol. Besides principal figure are eight others—those on the pedestal t three angels bearing a scroll, on which is inscribed the d injunction, "Feed my sheep." Above are the four Apos and, crowning all, the Saviour. The propriety of so i ducing the last-named may be questioned. The decorative tions are extremely well finished, and the general style o work is highly creditable.

SILVER SALTS. BY LAMBERT AND RAWLING

The silver salts, by Lambert and Rawlings, are of very ciful and appropriate device; the dolphin in the one, and shell in the other, being both emblematic of the briny They are, besides, very prettily executed, the workman being of the highest order.

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by WILLIAM LITTLE, 198, Strand, aforesaid.—SATURDAY, JULY 19, 1851.—SUPPLEMENT.

THE ILLUSTRATED LONDON NEWS

No. 504.—VOL. XIX.] SATURDAY, JULY 26, 1851. TWO NUMBERS, 1S.

THE JEWISH QUESTION.

FIVE times the House of Commons, by large majorities, has affirmed that British Jews are entitled to all the privileges of British citizenship; and five times the House of Lords has denied the proposition. The electors of the city of London have twice deputed a Jew to represent them in Parliament; and the constituency of the metropolitan borough of Greenwich have once imitated their example. The House of Lords, however, sets all these things at nought; and, braving not only the past, but all future consequences, determines that in an assembly over which it ought constitutionally to exercise no control, no Jew, if he be sufficiently impressed with the sanctity of an oath to decline swearing on the "true faith of a Christian," shall be the nominee and representative of Christians. The case altogether is a very singular, and threatens to be a mischievous one; and will assuredly, if not speedily settled, open up many other questions, which it would be far better not to meddle with. The scenes enacted in the House of Commons during the past and present week are of themselves sufficiently inconvenient to cause the House of Lords to reflect upon what it has done, and to make the cool, clear heads of that assembly anxious for a solution of the question which shall prevent such scenes in future, and remove all possible ground for collision between the two branches of the Legislature. The House of Lords should remember not only what it can do, but what it cannot undo. Though it will not allow Jews to sit in Parliament, it has, in unison with the other two branches of the Legislature, permitted Jews to elect members to that assembly. The Jews may not make laws in this Christian country, but they may make the lawmakers, and they may be, and are, continually called upon to act judicially. Mr. Salomons, whom the Lords will not permit to sit in the Commons, is a magistrate and a judge. Jews are not only voters and jurors, but sheriffs, aldermen, Lords Mayor, and town and country magistrates, and justices of the peace. If chosen by their fellow-citizens to serve in these offices, they are liable in some cases to heavy fine for refusal. If they plead their religion as a disqualification for serving as jurors, and disobey the order of a judge of the superior courts to take their places in the jury-box, they may be committed to prison; and if they refuse to execute the responsible office of Sheriff, the penalty of £500 levied upon them shows the high sense entertained of their fitness, and the displeasure of their countrymen that men so well qualified should deprive the state of their services. Why the House of Lords, knowing all these things, and seeing the current of public opinion, should persist in retaining the last useless mark of political and social degradation accidentally affixed upon the Jews, surpasses the wisdom of most people to discover. It is worthy of particular notice, that there is, strictly speaking, but one branch of the Legislature that has and will have nothing to do with the Jews; for, while the House of Commons affirms and re-affirms its wish that Jews, who help to make its members, should become members themselves, the Queen receives and approves of them as Sheriffs and magistrates, and, what is more, confers upon them the hereditary rank of Baronet—an order of nobility of a high and honourable character. Should the Sovereign be advised to go one step further, and elevate a Jew to the Peerage, the House of Peers—the mere creation of the Sovereign's breath—could scarcely so affront the "fountain of honour and dignity," as to deny the Queen's right. Such an attempt to force a solution of the difficulty is, no doubt, extremely improbable, but it is not impossible, and would not be illegal; and the mere consideration of the impolicy of a difference between the Crown and the Peers upon a question of honour, ought to suggest

MR. ALDERMAN SALOMONS, M.P. FOR GREENWICH—FROM A DAGUERREOTYPE BY BEARD.—(SEE NEXT PAGE.)

THE NEW SPANISH STEAM-SHIP "ISABEL LA CATOLICA."—(SEE NEXT PAGE.)

to the Peers the impolicy of a similar difference with the third branch of the Legislature.

But the Christianity of Parliament is, after all, a difficult thing to understand. The man who considers oaths as useless formalities, may come in. He who treats the words as unmeaning, cannot be excluded by all the ingenuity which our law or our Christianity can devise. It is only the conscientious man that can be touched; and our Christianity not only contradicts, but defeats itself. It was the Divine command to the Apostles, not to swear at all. Thus, if the strict letter and spirit of Christianity were followed, the Jews might sit in Parliament without let or hindrance, as no oath could be required of them. The same form of oath which now excludes the Jew, formerly excluded the Quaker; and if the Christianity of the nation were really so sincere, so thorough, and so unc mpromising as the decisions of the House of Lords would make it appear to the world, it would frame some means to exclude the Jew because he is a Jew, and not be contented, on a principle so vital, to rest his exclusion on an accident not intended to affect him. But we owe an apology to our readers for arguing the question at all. There never was a case solemnly debated in such august assemblies as the British Houses of Parliament, which had such small amount of argument to recommend it as that undertaken by those who resist the admission of the Jews to the full rights of citizenship on the ground of its "dechristianisation" of the State. The intelligence of the nation has long ago decided in favour of the Jews; and the real matter at issue at the present moment is to ascertain, once for all, whether the House of Lords has, in strict constitutional law, anything whatever to do with it, and whether the Government, in introducing a bill in the regular course, has not, in fact, taken a step which was not only not required, but which has served to encumber a really simple question with a mass of irrelevancies, contradictions, and absurdities. But we trust the House of Commons, and the great legal authorities who have seats in it, will yet discover the means of extrication from the dilemma in which the election of Baron Rothschild and Mr. Alderman Salomons has placed the several branches of the Legislature. If they do not, the ultimate solution of the difficulty will not be prevented, but will simply be rendered more inconvenient to all parties, and more especially to the House of Lords. There can be no doubt that London, and one or two other great constituencies, will continue to elect Jews to represent them, and that Jews holding the high position of such men as Mr. Rothschild and Mr. Salomons will continue to demand admittance. Failing in any other means of setting the question, the House of Commons will continue to pass bills for the abolition of the form of oath now demanded to be taken by Jews, and the House of Lords at the eleventh hour will be compelled, by the force of public opinion, to yield, without dignity on its own part, and without gratitude on the part of the people. Such a state of things is earnestly to be deprecated.

PARLIAMENTARY PORTRAITS.

ALDERMAN SALOMONS, M.P. FOR GREENWICH.

MR. ALDERMAN SALOMONS was born in London in 1801. His family has been long established in this country, and his father and grandfather were both natives of England. As he himself stated in his evidence before the Committee of the House of Commons on oaths of members:—"Being an Englishman, I have keenly felt the disabilities I lie under; and my attention has been for a great many years almost from the earliest period that I have been able to think for myself drawn to the subject. I have endeavoured to see how the law applied by which I was deprived of what I thought the ordinary privilege of Englishmen. The first difficulty was that with regard to the admission of Jews to the freedom of London." But this difficulty having been removed by the exertions of the present Lord Denman, then Common Serjeant, Mr. Salomons, in the year 1835, was elected Sheriff of London. In the same year he was a candidate for the Aldermanic gown of Aldgate Ward, and was elected, after a severe contest against Mr. Alderman Humphery. His election was, however, annulled by the Court of Aldermen. In 1834, Portsoken Ward became vacant, and Mr. Salomons contested it against Mr. Moon, was again elected, and again rejected by the Court of Aldermen. In 1847 he received an unanimous invitation to become the Alderman of Cordwainers' Ward, for which he now sits. In 1839-40, Mr. Salomons was appointed High Sheriff of the county of Kent, and he is now a magistrate for that county, as well as for Sussex and Middlesex. In 1837 he contested the borough of Shoreham, and at the last general election he was a candidate for Greenwich, when he polled 1236 votes. On the vacancy occasioned by the death of Mr. Barnard, Mr. Salomons again came forward, and was opposed by Mr. Wire, whom he defeated by a majority of 897 votes, the numbers being, Salomons, 2208; Wire, 1311.

Among other public acts, Mr. Salomons has founded a scholarship, of the annual value of £50, at the City of London School, tenable for three years, at the Universities of Oxford, Cambridge, and London. The first Salomons scholar greatly distinguished himself at Oxford, and has recently been appointed Head Master of the Grammar School at Burton-on-Trent.

In politics, Mr. Salomons is a decided Liberal, opposed to extreme views, but a strenuous advocate of civil and religious liberty.

On Friday, the 19th inst., Mr. Salomons, who, in the course of his canvass, had pledged himself, if elected, to take his seat, presented himself at the table, requested to be sworn upon the Old Testament, declined to repeat the words "upon the true faith of a Christian," and having else completed the oaths, sat down. He subsequently, however, by direction of the Speaker, withdrew behind the Bar—Sir Benjamin Hall at the same time, stating that, although Mr. Salomons retired through deference to the Speaker, he nevertheless claimed of right to take his seat. After some conversation, the question was then adjourned to Monday.

On that day, immediately after the presentation of petitions, Lord J. Russell, in reply to a question by Sir Benjamin Hall, stated that the Government had no intention of prosecuting Mr. Salomons for the substitable penalties to which, by having on Friday taken his seat, he had rendered himself liable. Mr. Salomons then again took his seat on the front bench on the Ministerial side, and just below the gangway; was immediately ordered by the Speaker to withdraw, but retained his seat amidst loud cries of "Withdraw" from the Opposition benches. Mr. Osborne rose, but not being able to get a word heard, laid a paper before the chair, which the Speaker refused to notice, as there was already a question of privilege before the House. A moment of silence occurred, and Lord John Russell moved a resolution ordering Mr. Salomons to withdraw; to which an amendment was moved by Mr. Osborne, seconded by Mr. Anstey, that Mr. Salomons was entitled to take his seat. Mr. Anstey not being able to gain a hearing on the amendment, moved that the debate be adjourned; this was lost by 65 to 232, and Mr. Salomons voted in the division, thereby subjecting himself to a penalty of £500, and after the division resumed his seat, when Mr. Anstey proceeded to argue upon the amendment, which, after an animated debate, in which Mr. Bethell contended for the member's undoubted right to sit, was lost by 81 to 229. In this division, as the question was personal to himself, the Alderman did not vote; and after some further debate, and a second division on the question of adjournment, in which Mr. Salomons again voted, and incurred a further penalty, a division took place on the motion that Mr. Salomons be ordered to withdraw, which being carried by 231 to 75, the Serjeant-at-Arms came up to Mr. Salomons, and, having touched his arm, the hon. member—who had previously addressed the House, stating that he intended no disrespect to the forms of the House or the Speaker, but merely to defend the right of his constituents—left the House, protesting that he did so under compulsion. His withdrawal was followed by an angry and disorderly discussion, in which it was settled that the hon. member had a right to sit behind the Bar; and Lord John Russell again stated that the Government would not prosecute for penalties. So ended a scene unprecedented in the annals of the House—Mr. Salomons, though not recognised as a member, having nevertheless addressed the House, not from below the Bar, as Mr. O'Connell, when returned for Clare, had done, but from the floor of the House.

Our portrait is from a Daguerréotype by Beard.

THE SPANISH STEAM-SHIP, "YSABEL LA CATOLICA."

THIS noble vessel, built by Messrs. Wigram and Sons, at Blackwall, lately left her moorings for Cadiz. The following are her principal dimensions; viz.:—

	Feet.	Inches.
Length over all from the figure-head to the taffrail	260	0
Length between the perpendicular	220	0
Breadth, extreme	38	0
Depth in the hold	24	6
Burthen in tons	2	0
Draft of water .. .. .. { Forward	17	7
{ Aft ..	17	7

with 627 tons of coals in her bunkers and coal reserves, with room for about 160 tons more coals; which, with her armament and stores, will bring her to 19 feet draft of water, as originally calculated. Her engines, by Messrs. Maudslay, Field, and Co., are of 500-horse power, and are constructed with their latest improvements.

We understand this vessel to have been built, launched, and to have had her boilers and engines on board within six months. From the pilot, Mr. Branscombe, jun., who had charge of her on the steamer leaving the Thames at Folkestone, we learn that her speed was twelve miles per hour, from the time she left Gravesend until he quitted her.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The rejection by the Legislative Assembly of the report of the select committee in favour of the revision of the Constitution, and a Ministerial crisis of very brief duration, constitute the main features of the political intelligence this week from Paris. The former important event took place on Saturday last. The whole of the sitting on this day was occupied by a very able and statesmanlike speech by M. Odilon Barrot in favour of the revision; and when he concluded, the discussion was declared to be closed, and the Assembly proceeded to vote, the number of members present on the occasion being 724, of which number, according to the 111th article of the Constitution, three-fourths, or 543 members, should vote in favour of the proposition in order to form a legal majority. The numbers, however, in favour of the revision were only 446, and the proposition was accordingly rejected, although the numbers against it were but 278, which gave a majority in favour of the revision of 168. The Assembly, on actual majority of 168 in favour of the motion. The number that voted was the largest since the formation of the Assembly, there being only thirty-seven members absent from voting or were absent on the occasion. The Left or Ultra-Democratic party hailed the result as a triumph. There voted along with the Left several members of the Legitimist party, as well as the following well-known leaders and influential parties:—M. Thiers, General Changarnier, M. Piscatory, M. de Rémusat, General Bedeau, General de Lamoricière, M. Combarel de Leyval, M. de Lamarine, M. Delessert, M. Hortense, M. de Lasteyrie, M. de Montalembert, and M. Berger (de Nord).

The Ministerial crisis arose out of the proceedings in the Assembly on Monday, when a charge was brought against M. Leon Faucher, the Minister of the Interior, of having unduly and unconstitutionally urged and fostered the petition movement in favour of the revision. M. Baze, who brought forward the subject, charged M. Faucher and the Government with having sent to the several prefects throughout the country the reports of the debates in the Assembly by the post of the same evening, thus anticipating the Paris journals by twenty-four hours, for the purpose of influencing the petition movement, the expenses of which were defrayed out of the public Treasury. He also accused Ministers of corrupting the press for the same object. The latter imputation M. Baze failed altogether in proving; and the former the Minister of the Interior openly avowed, for it was no secret; on the contrary, it was an act of general notoriety, for the item was placed among the estimates, and subject to the revision of the Assembly.

After a warm altercation between M. Baze and the Minister of the Interior, the motion proposed by the former, viz.

"The National Assembly, while regretting that in some localities the Government, contrary to its duty, had used its influence to excite the citizens to petition, ordains the legal petitions to be deposited in the Bureau des Renseignemens,

was carried by a majority of 15, the numbers being 353 for, and 320 against. This decision in so full a House was regarded as a vote of censure by the Ministers, and they accordingly tendered their resignations to the President of the Republic, who declined to accept them. After a consultation they again waited on the President, and a second time tendered their resignation; but at his earnest request, and in order to avoid carrying the country to agitation at the present moment, they ultimately consented to retain office. The general opinion out of the Assembly is, that the vote was factious and unwarranted, and was a blow struck at the Chief of the State through his Ministers, and not at the Ministers themselves.

Cardinal de la Tour d'Auvergne, Archbishop of Cambrai, died at that place on Sunday.

Marshal Sebastiani also died on Sunday, at Paris. His death was exceedingly sudden, the event occurring while he was sitting at his breakfast table. He was in his 80th year.

The President of the Republic has dissolved the National Guard of Chatellerault, for the insult offered to him upon his late visit to Poitiers.

The inauguration of the Tours and Nantes Railway is fixed for the 17th of August, at which the President of the Republic will be present.

The Moniteur announces that a French and a Spanish commission had been appointed to fix, in a definitive manner, the line of boundary between France and Spain, along the Pyrenees.

UNITED STATES.

Accounts from New York to the 9th instant mention that at Washington, the 4th of July was selected for laying the corner-stone of the proposed enlargement of the Capitol. A great concourse of persons, strangers was present, and the ceremonies excited a general interest. A procession was formed, composed of various military, benevolent, literary, and other associations, the President of the United States, and the heads of the different departments of Government, the officers of the army and navy, representatives of foreign nations, and an immense number of citizens from all parts of the union. The ceremony, or laying the corner-stone was performed by President Fillmore; after which an oration was delivered by Daniel Webster, in which he gave an eloquent exposition of the principles of the American constitution, and urged the importance of a faithful adherence to the union.

General Scott has now been nominated for the Presidency by Whig state conventions in Ohio, Pennsylvania, Michigan, and Indiana, and by public meetings and papers in several other states.

Jenny Lind had met, at Hartford, with some slight manifestations of brutality. Her auditory assembled in the Fourth Church, and a crowd of 2 00 having assembled outside the office, the blinds were drawn and the windows closed to "prevent a stampede from scenting." Great tumult ensued, some of the shrubs were smashed, and for a time the singers were inaudible. Jenny, however, suffered no personal insult, and escaped through a back-door to Springfield.

Some new revelations in the American slave trade announced; the parties of the golden plates withheld from Joe Smith having been exhibited mysteriously to Elder Orson Hyde.

From Chagres (Central America), we learn that the railway from Navy Bay was rapidly proceeding, and a fresh accession of labourers had been brought over by the American ships *Empire City* and *Pronetheus*. The latter vessel also brought out several fine steamers for the navigation of the river between Greytown and Nicaragua. Very heavy rains had fallen at Greytown.

WEST INDIES.

Advices, dated June 28, have been received this week from Jamaica. They communicate a novel and interesting intelligence from this quarter, viz. the arrival of a number of coolies and emigrants from the East Indies, which it is believed has something to do with cotton cultivation in the island, as some gentlemen have gone out to look at them from Georgia to investigate the capabilities of the soil for that production. The cholera has again broken out at Kingstown, where it is very destructive. In the country districts the malady is still raging to a frightful extent.

AUSTRALIA.

We have this week accounts from Western Australia to the 30th of April, New South Wales to the 16th of April, and South Australia to the 3d April inclusive.

The Anti-Transportation League were about sending a delegate to England for the purpose of furthering the objects of the association.

A fine capacious harbour is reported to have been discovered in Gipp's Land, called Lewis's Channel, into which vessels of the largest burden can safely enter. This, it is remarked, would obviate the necessity of settlers sending their wool to Sydney, Hobart Town, or Melbourne. The importance of the object is again mentioned, and a vessel had been despatched for the purchase of a number in South America.

The elections occupied the chief attention of the colonists at Adelaide (South Australia). The fourteenth anniversary of the settlement had been celebrated by the oldest colonists dining together. The carpenters and joiners of the city had established a committee for the purpose of erecting machines into the colony, but they would finally have to give in.

Two new newspapers had been issued—one in English, and the other in German.

From all the districts of the Australian territories the intelligence marks a rapid rise in the price of wheat, flour, bread, &c., in consequence of a severe drought and the prevalence of bush fires. The latter had done considerable damage. Whole farms and every bad been destroyed, together with great quantities of grain of all kinds, varying in the districts from 10,000 to 20,000 bushels. The bush had been most severe in the Melbourne district, and the drought continued up to the latest date.

A letter from Rome, of the 14th, states that an attempt was made on the 11th to assassinate Monsigner Tizzani, Bishop of Terni, by blowing up the house he inhabited at Santa Maria Maggiore. Fortunately the machine exploded before it reached its destination, and only caused some slight damage to the outer wall of the building. The unknown authors of this criminal attempt had previously stuck up bills in the streets, inviting the friends of the prelate to be present at his funeral. Monsignor Tizzani is almoner general to the Pontifical troops.

IMPERIAL PARLIAMENT.

HOUSE OF COMMONS.—SATURDAY, JULY 19.

The House had a mid-day sitting.

The Bill for dissolving the National Land Company was read a third time, and passed.

On the order of the day being read for receiving the report of the Committee of Supply, a discussion took place upon the payment of £220 as fees on the retirement of the late Queen Dowager.

In the course of the discussion, Mr. GLADSTONE called attention to the Sinecure Rites notice which the Church of England in the colonies labours in not being in a position to make rules for the government of their own community, or for assemble the clergy or laity like the members of other religious denominations. He might here, gentleman gave notice, that if the Government did not interfere, it was his intention next session to propose an enabling bill; giving the Church clergy and laity the same powers in this respect as are possessed by other religious communities.

A division was taken upon the question that the sum (£50,000) granted toward civil contingencies be reduced by £220, the amount paid to the Dean and Chapter of Windsor for the Queen Dowager's interment fees. The proposed reduction was negatived by a majority of 91.

The Mercantile Marine Act Amendment Bill passed through committee.

Several other bills were advanced a stage.

A bill, brought in by Lord Seymour, to confirm certain provisional orders of the Board of Health was read a first time.—Adjourned.

HOUSE OF LORDS.—MONDAY.

The Turnpike Acts Continuance Bill was considered in committee, when clause was proposed by the Earl of LANESBOROUGH, prohibiting on turnpike roads the use of carts drawn by dogs.

The clause was opposed, and, upon a division, was rejected by a majority of 29.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The Marquis of LANSDOWNE moved the second reading of the Ecclesiastical Titles Assumption Bill. After the aggression upon the religious institutions of this country which had characterised the act of the Papal See, it would not be consistent with the respect which was due to the Crown and to the feeling of the people to remain acquiescent or indifferent.

The Earl of ABERDEEN was not disposed to imagine he could make any impression upon their Lordships, or that he was likely to obtain any sympathy or concurrence from any large portion of the House. He merely desired to be considered as giving vent to the dictates of his own conscience, and expressing a deep conviction of the justice of the cause of truth and of justice. To talk of territorial titles, as if they conveyed any right or possession, was a misapprehension of terms. The bill, too, made all acts come under bulls and rescripts to be of force. He declared he could not contemplate the consequences of so arbitrary and tyrannical a measure; and as to any accusation of disloyalty, he rejected it with contempt and indignation. He foretold, that, unless, as he expected, the measure became a dead-letter upon the statute-book this provision would be most fruitful in injurious consequences, for it would renew the animosity and discontent which, for the last twenty years, had been gradually subsiding. The noble Earl concluded by moving the rejection of the bill, viz. that it be read a second time that day six months.

Lord BEAUMONT supported the bill.

The Duke of WELLINGTON acknowledged with regret, that the act of aggression on the part of the Papal see had convinced him of the necessity of modifying some of the provisions of the Roman Catholic Relief Act, and of re-imposing checks and restrictions of a kind calculated to prevent a recurrence of similar aggressions

The Earl of Malmesbury, Lord Berners, the Duke of Argyll, the Earl of Airlie, and the Bishop of St. David's severally supported the bill.

On the motion of the Earl of WINCHELSEA, the debate was adjourned, at thirty-five minutes past twelve.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

Mr. Collins (the new member for Knaresborough) took the oaths and his seat.

MR. SALOMONS.—JEWISH DISABILITIES.

Before the order of the day was read,

The SPEAKER rose and said: Before the Clerk proceeds to read the order of the day, I have to read to the House a letter which I have received from Alderman Salomons since the House adjourned on Saturday last. It runs thus:

"SIR,—I take the liberty to call your attention to a very important omission in the record of the proceedings of the House of Commons on Friday last of all notice of my demand to subscribe the oath of abjuration, and to declare to my property qualification. Immediately after I had taken the oaths, I read from a paper which I hold in my hand the following words:—'I have now taken the oaths in the form and with the ceremonies that I declare to be binding on my conscience, in accordance with the statute 1 and 2 Victoria, cap. 105. I now demand to subscribe the oath of abjuration and to declare to my property qualification.' No notice has been taken on the proceedings above referred to, if my demand to subscribe the oath of abjuration. I am sure, sir, pardon me for drawing your attention to the subject, and respectfully request that the minutes of the proceedings of Friday last be amended.—With the utmost respect, I have the honour to be, sir,

"Your most obedient and humble servant,

"DAVID SALOMONS."

I ought to state to the House that the record of the proceedings was very carefully prepared; and although what was stated by the honourable member was perfectly inaudible in this part of the House, yet it appeared to me, after he had read the words which this part of the House had been read accordingly, immediately ordered him to withdraw, that therefore it was his duty to have with drawn (Loud cries of "Hear, hear," from the Opposition benches); and this statement having been made subsequently to my ordering his withdrawal, it was therefore not thought right to enter it on the record. (Renewed cries of "Hear! hear.") The Clerk will now proceed to read the order of the day.

The order of the day for the House proceeding on administering the oath of abjuration to David Salomons, Esq., having been read accordingly,

Sir B. HALL rose and recapitulated what occurred on the previous Friday, and in so doing he asked whether Government would authorise a prosecution of Mr. Salomons for the acts he had done upon that occasion

Lord J. RUSSELL replied that he thought Sir B. Hall fully authorised to ask the question, but he had no hesitation in replying that, reserving to the Government the right of hereafter acting as they might think proper, he did not consider that a prosecution ought at present to be ordered by Government.

Sir B. HALL said that the only course then open to Mr. Salomons was to take his seat in the House

Upon this announcement, Mr. Salomons, who had been sitting under the gallery, came down into the House and took his seat in the front of the Liberal benches, just below the gangway, between Sir W. Molesworth and Mr. C. Anstey. This step was hailed by many persons with marks of approbation and the reverse, which lasted for a little time

The SPEAKER ordered Mr. Salomons to withdraw, but that gentleman did not obey the order.

Mr. B. OSBORNE handed in a written motion, which he requested the Speaker to put, but the latter decided that the point of order before the House must have precedence over everything else, and he would say nothing more than to support the chair.

Lord JOHN RUSSELL, considering that the House was bound to do so, moved that Mr. Salomons be ordered to withdraw.

Mr. ANSTEY seconded the motion, and, at his request, put as an amendment to the Speaker. It was to the effect that Mr. Salomons, having been returned for Greenwich, and having taken the oaths, was entitled to take his seat.

Cries of "Withdraw" and loud cries of "Oh, oh!") commenced an argument to show that the abjuration oath had not been enjoined by law, and that the House had not prescribed any form of taking it. The House showing great impatience, Mr. Anstey moved the adjournment of the debate, which motion was, upon division negatived by 207 to 68, majority against it, 139.

[Mr. Salomons voted on this occas on.]

On the re-admission of strangers, Mr. Salomons was observed to have again taken his seat in the House.

Mr. MILNER GIBSON put a question to the Speaker as to the authority on which he had on Friday described the sense in which the House understood the act of parliament.

The SPEAKER replied, that he had referred to the decision of the House on Baron Rothschild's case

Mr. GIBSON wished to ask his question, when

Lord JOHN RUSSELL protested against such a course as inconvenient. The Speaker could not to be drawn into a debate

Mr. ANSTEY, at great length, said that Mr. Salomons had sworn "quite enough and too much," and that he had a perfect right to his seat. He announced with astonishment that Mr. Salomons had already voted (upon the question of an amendment) in the House. It was the duty of Government to have given every facility for bringing the question under the decision of a court of law. Introducing an extended historical sketch of the position of Jews in England, from the time of Edward I. to the present day, he concluded that the oath of abjuration was a voluntary and an unlawful oath. The question had made great progress since last year, for the honourable member for Greenwich was now in his seat. He urged upon the House to assert its rights without regard to the House of Lords.

Mr. B. OSBORNE attempted to address the House, but the Speaker decided against his right to do so, as he had moved the amendment.

Mr. ANSTEY then proceeded to address the House; but, being careful in the course he pursued, as he might expose himself to penalties. He warmly advocated Mr. Salomons's right to sit.

The ATTORNEY-GENERAL, in supporting (though with feelings of reluctance) Lord John Russell's motion, said that the case was very simple. It did not was very explicit in its enactment that no person should sit or vote without taking the oaths, and the House was competent to prevent the violation of the law, which he thought it ought to do, and not, as suggested, leave the question to be decided by legal tribunals

Mr. MILNER GIBSON thought that while there existed such serious differences of opinion among the law-officers of Government, as had prevailed upon the question of this oath, the House ought to be very careful how it expelled Mr.

Salomons. The House ought to avoid a collision with the courts of law, and allow the judges, at a fitting time, to decide whether Mr. Salomons had taken the oaths properly or not. As the law was so doubtful, he should oppose Lord J. Russell's motion.

The SOLICITOR-GENERAL said, he took upon himself the whole responsibility of advising Baron Rothschild last session not to take his seat. He was far from saying that the law was clear upon the point at issue, and his own opinion of what was the law remained the same as it was last year. The House had, however, come to a different conclusion in the case of Baron Rothschild, and that decision was, in fact, a judgment in which he did not agree, but which he thought they were bound to recognise and obey. Under these circumstances, he thought no course was left him but to support the motion, that Mr. Alderman Salomons be directed to withdraw.

Mr. CLAY thought the question was virtually settled, for they had a Jew now sit in the House; and those of his race would certainly follow through the door he had opened, with a loss of a little more or less of dignity on the part of the House, according to the length to which the struggle might be protracted

Mr. C. VILLIERS wished to know, if there was a member of the Stuart fam ly now living, and if the hon. member for Greenwich were to take his part against the reigning family, whether the law officers of the Crown would or would not think him, after the oath he had now sworn, amenable to an indictment for perjury?

Lord J. RUSSELL said he had intended to have taken the same course in this case as he had, on last year, had he not been anticipated by an hon. member declaring that Mr. Alderman Salomons had no course but to take his seat. As long as the resolution remained in force it should be observed, but as soon as the hon. member for Greenwich should have withdrawn, the House might be enter up in the discussion as to whether that decision should not be reversed. The hon. gentleman had placed himself in a very different position from that of Baron Rothschild, for he had sat and voted, and it would be for the House to consider what alteration that might make in the views the House might be disposed to take of the question.

Mr. BETHELL contended that the hon. member for Greenwich was entitled to his seat, for the oaths ought to have been administered according to the law, and the law always required that the oath should be administered in the manner most binding on the conscience. The statutes must be construed according to the principles of common law, and it was well understood by all lawyers that the principles of common law over-rode the forms directed by the statutes, if those forms were, as in the present instance, manifestly absurd. When once they considered that the person had a right to be sworn on the Old Testament, they were bound to alter the form of the oath, so as to make it consistent with the form of administering it.

Sir F. THESIGER controverted the legal position taken by Mr. Bethel, and contended that the oath had not been taken in a manner that satisfied the statute. The words "on the true faith of a Christian" were the sub-tance of the oath, and they could not be separated from it without the sanction of an express act of Parliament. After the course which had been pursued, the presence in the House of the hon. member for Greenwich was commanding, and he should have been prepared to vote for it communial. Under all the circumstances, however, he perfectly concurred in the noble Lord's motion.

Mr. AGLIONBY supported the view taken of the law by Mr Bethell.

Sir E. INGLIS said the course proposed by Lord J. Russell was the one most consistent with the dignity of the House, and he should, therefore, support it.

Mr. BRIGHT called attention to the fact that two important constituencies had chosen Jews as their representatives. He hoped that Lord John Russell would endeavouring to make the elections of those constituencies null and void, rather than grapple with the difficulties of the subject; and he condemned the oaths required at the table of the House as puerile and absurd.

Mr. NEWDEGATE called on the House to maintain the authority of the chair. The appearance of the "elected of Greenwich" was an unparalleled audacity, and it was the duty of the House to compel him to quit it once more.

After a few words from Mr. J. EVANS and Colonel THOMPSON, in support of the amendment,

Mr. J. A. SMITH said he was requested by Mr. Salomons to state that he had voted in the first division; but this motion being personal to himself, he should, according to the custom in such cases, withdraw.

The House then divided, and the numbers were—

For the amendment	.. ..	81
Against it	.. ..	229
Majority	.. ..	—148

Mr. ANSTEY said he hoped the hon. gentleman the member for Greenwich would not refer himself to be swayed by feelings of delicacy, but that he would to the next division remain and vote in defence of the privileges of the electors of Greenwich. He moved that the debate be adjourned.

Lord J. RUSSELL said, that, should the House determine that Mr. Alderman Salomons should withdraw, he would to-morrow move a resolution similar to that which he had moved in the case of Baron Rothschild. In the meantime, if the hon. member for Greenwich were after the House should decide upon his doing so, other measures must be resorted to.

Sir B. HALL hoped the debate would not be adjourned, for no further light could be thrown upon the subject, and it would be better to come at once to the decision.

After a few words from Mr. WAWN,

Mr. THOMSON expressed a hope that Mr. Salomons would state the course he meant to pursue after the division.

Mr. SALOMONS then rose amidst much cheering, and said he should not have presumed to address the House but for the observations of Mr. Hobhouse. He assured the Speaker that he had no wish to be disrespectful or contumacious either to him or to the House, but representing a large constituency, and standing up for his own rights, he felt bound to take the course he had done. "Having said this," he added, "whatever the decision of this House may be, I shall willingly abide by it, provided there be just sufficient force used to make me feel that I am acting under coercion. With these sentiments I shall not further intrude myself on this House, except to say this, that I trust, and I hope, in the doubtful state of the law, such as it has been described to you by the statement of those who have addressed you, no severe measures will be adopted against me and my constituents, without giving me the fairest opportunity of addressing this House, and of stating to this House and the country what I believe to be my rights and those of my constituents; what I believe to be the duty of this House, and what I believe this House will never refuse; what no court refuses to the meanest subject of the realm—that of hearing him before their final decision."

Mr. BAILEY supported the adjournment of the debate, in order that they might consider the legal arguments of Mr. Bethell, which he thought must have shaken the opinion of the noble Lord himself.

Sir Du. EVANS also hoped an adjournment would be agreed to.

Lord J. RUSSELL, whilst praising the temper with which the hon. gentleman had spoken, regretted he could not comply with his request for a full hearing. The authority of the House must be supported. He was willing, however, to postpone the consideration of the question till to-morrow.

Mr. B. OSBORNE said he would advise his hon. and learned friend not to withdraw from his seat until taken into custody by the Serjeant-at-Arms; for certainly he felt that there was a power out of the House which would soon after bring certain hon. gentlemen in that House, and in the other House also, to their senses.

The House then divided, and the numbers were—

For the adjournment	.. ..	75
Against it	.. ..	237
Majority	.. ..	—162

The adjournment was accordingly negatived.

The House then divided on the original motion that Mr. Salomons do withdraw—and the numbers were—

For the motion	.. ..	231
Against it	.. ..	81
Majority	.. ..	—150

The motion was accordingly agreed to.

The SPEAKER then called upon Mr. Alderman Salomons, pursuant to the resolution of the House, to withdraw.

Mr. Alderman Salomons still retained his seat.

The SPEAKER directed the Serjeant-at-Arms to move Mr. Alderman Salomons below the bar.

The Serjeant-at-Arms having approached the honourable member for the purpose of carrying the Speaker's orders into effect, and gently touched his shoulder, Mr. Salomons rose, and bowing to the Speaker, said, "Mr. Speaker, I leave in"—when he was interrupted by loud cries of "Order" and "Withdraw," upon which he accompanied the Serjeant-at-Arms below the Bar, amidst the cheers of the Opposition.

Lord J. RUSSELL said the resolution he had to propose next day was similar to the resolution approved of by the House last year in the case of Baron Rothschild; namely, "That David Salomons, Esq., was not entitled to sit in that House and vote in any debate until he had taken the oaths appointed by law." He wished it to be understood, however, that if Mr. Salomons wished to be heard, he might be heard at the Bar of the House in the same way as Mr. Daniel O'Connell had been. (Cheers.)

Mr. B. OSBORNE wished to ask, if, after what had taken place that night, the Government intended to institute a prosecution against the hon. member for Greenwich?

Lord J. RUSSELL said, that, if the hon. member for Greenwich really wished to be prosecuted, he had no doubt he would find plenty of persons willing to do it for him. (Cheers and laughter.)

The further consideration of the question was then adjourned until next day (Tuesday).

The House then went into Committee of Ways and Means, when several votes were agreed to.—Adjourned at a quarter before two.

HOUSE OF LORDS.—TUESDAY.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The adjourned debate was resumed by

The EARL of WINCHILSEA, who supported the second reading of the bill, but regretted that it did not go much further than it did, in order to protect the rights of the Protestant people of England from the encroaching and aggressive influences of the Church of Rome.

Lord LYNDHURST condemned, as illegal and insulting, the titles which had been assumed under the Papal bull. He supported the bill, thinking it better to meet an encroachment of the kind at its commencement, rather than wait until the constant repetition had tended to render the evil formidable

Lord VAUX (of Harrowden) expressed his opposition to the bill, which he regarded as attended with many dangers, especially with reference to its effects on Ireland. He regretted on many accounts that the Government should have deemed themselves obliged to meet the acts of the Papal See in such a spirit, as he did not see how bishops could be created without describing the limits of their jurisdiction. Admitting that the ultra assumption of the Roman Catholic hierarchy was impolitic, he thought the conduct of Ministers calculated greatly to add to the irritation excited.

The Earl of WICKLOW opposed the bill. He was astonished that the Government should have adopted the bill after the alterations made in its passage through the House of Commons. That the bill will be injurious to the working of the Roman Catholic religion in this country, he thought was as clear as the sun at noon-day. It would either make the establishment of Romish bishops, with all the acts flowing therefrom, illegal, or it would be inoperative and a dead letter. He feared that the ultra ra assumption into the bill, as referred to the functions of the Attorney-General, would make it a dangerous and formidable weapon in the hands of bigotry. So far from thinking that the Pope intended any insult in what he had done, he regarded his whole conduct as dictated by a studious desire to avoid offence; for he had abolished, so far as the Roman Catholic Church was concerned, the ancient sees of the kingdom, for the purpose of establishing new sees on unoccupied ground. The whole bill, therefore, fell to the ground. But what deplorable inconsistency it was to profess resentment at the conduct of the Pope, and yet to direct the bill, not against the Papal See, but against our Roman Catholic fellow-countrymen! He did not anticipate any serious disturbance in Ireland owing to this measure, but only because the people had made up their minds to set it at complete disregard. It could not be enforced, and this everybody well knew; but what folly to pass laws which were not intended to be strictly maintained in vigour.

The Duke of NEWCASTLE contended that the assumption of titles merely as a designation of office in a Church over which the Queen neither had, nor claimed to have any supremacy, could not be any infringement on her prerogative as head of the Church.

The Marquis of CLANRICARDE, in support of the bill, reminded those noble Lords who objected to more of its details, that at the present period of the session they had no choice but the measure before them or none at all.

Lord MONTEAGLE opposed the bill, which he feared would give rise to agitation, and possibly disturbance in Ireland if it should become law.

The Lord CHANCELLOR said, that, considering the state of public opinion resulting from the insolent assumptions of the Papacy, it was impossible to pass them by in silence. As an application to Rome to have the bill withdrawn would be an unworthy proceeding, while, on the other hand, it would be puerile to meet it by a mere resolution of Parliament, which would only give encouragement to further aggressions. The most direct and legitimate course, therefore, would be to pass a solid bill upon the subject, like that under consideration.

The debate was continued by the Earl of St. Germans against the bill, and the Earl of Minto, Earl Fitzwilliam, and the Earl of Harrowby in favour of it.

The Marquis of LANSDOWNE replied on the part of the Government, and the House divided: the numbers were—

For the second reading—		
Present	.. ..	146
Proxies	.. ..	119
		— 265
For the amendment—		
Present	.. ..	26
Proxies	.. ..	12
		— 38
Majority for the second reading	.. ..	227

Their Lordships adjourned at five minutes before four o'clock on Wednesday morning.

HOUSE OF COMMONS.—TUESDAY.

CHARTIST SUFFERINGS—ERNEST JONES.

Lord D STUART drew attention to the case of Mr. Ernest Jones, who complained that, whilst undergoing a sentence of imprisonment for attending an illegal meeting and delivering a seditious speech during the Chartist agitation in 1848, he had been subjected to very harsh treatment, by which his health was seriously affected. The noble Lord gave notice, that next session he should move that the whole case should be investigated by a select committee. But, in the meantime, he moved for copies of all rules and regulations as to fines, from the year 1849. In the several prisons of England and Wales, so far as related to prisoners convicted of political offences.

The motion was seconded by Mr. W. WILLIAMS, and supported by Mr. W. J. FOX.

In the discussion which followed, the course which had been pursued towards Mr. Jones was very generally condemned.

Mr. BOUVERIE, however, contended that it was a mistake to suppose that persons convicted of political offences should not be exposed to any other deprivations than merely that of their liberty. There were rules applicable to all misdemeanants, and to those rules they must submit. There was no distinction between political and other offenders recognised by law; and, therefore, if the noble Lord wished to have copies of the rules and regulations affecting such prisoners, he could only attain his object by asking for the copies of the rules and regulations of all the prisons in the country indiscriminately.

The CHANCELLOR of the EXCHEQUER stated that the motion could not be agreed to in the form proposed, because the law recognised no distinction in the rules relative to political and ordinary offenders.

Lord D. STUART withdrew the motion, upon an understanding that he should propose a modification of it at a future opportunity.

The report of the Committee of Ways and Means was agreed to.

This terminated the business of the morning sitting.

THE GERMAN CONFEDERATION.

At the evening sitting,

Lord PALMERSTON stated, in answer to a question from Mr. Anstey, that the representative of her Majesty at the Germanic Diet at Frankfort had, along with the representatives of France, protested against the admission of the non-German provinces into the Germanic Confederation. No answer, he added, had been received to this protest, but he expected one by the next messenger. Her Majesty's Government could not assent to the doctrine that this was a purely German question.

THE CAPE OF GOOD HOPE.

Lord J. RUSSELL, in reply to a question from Mr. Adderley, stated that the draft constitution for the Cape of Good Hope would be sent out complete in all its details, and that it would combine the various suggestions that had been made upon the spot. It would not, however, contain any provision for effecting a separation between the two provinces; it would be left for the legislature of the colony to consider such a separation.

JEWISH DISABILITIES—MR. SALOMONS.

Mr. ANSTEY asked the Speaker whether the entry of Mr. Alderman Salomons' letter in the proceedings of the House was sufficient to place on record the reason why he had omitted the words "on the true faith of a Christian" from the oath of abjuration? If the answer were in the negative, could he move that the honourable member for Greenwich be brought to the table, and asked his reason for the omission of those words?

The Speaker replied that the letter of the honourable member was the best possible record of his opinion on the subject of the oath; but that the House could not admit of any further proceeding until he had been sworn in the regular way at the table.

Lord J. RUSSELL then brought forward the motion of which he had given notice, to the effect "that David Salomons, Esq., is not entitled to vote in this House, or to sit in this House during any debate, until he shall take the oath of abjuration in the form appointed by law." The subject had been so fully debated last session, that it was unnecessary for him to occupy the time of this House with arguments in support of his motion.

Mr. ANSTEY moved, by way of amendment, "that David Salomons, Esq., member for the borough of Greenwich, having sat and voted in this House without having taken the abjuration oath in the words contained and set forth in the form tendered unto him at the table, the Attorney-General of England be ordered to institute proceedings against him at law for such default, pursuant to the act 6th Geo. 3, c. 53."

Sir B. HALL hoped the hon. member for Youghal would withdraw his amendment, in order to allow another to be proposed.

Mr. ANSTEY then withdrew his amendment.

Mr. BETHEL moved as an amendment upon Lord J. Russell's motion, "That Baron Lionel de Rothschild and Alderman Salomons, having taken the oath of allegiance and supremacy, and also the oath of abjuration, in the manner in which this House is bound by law to administer the same, are entitled to take their seats as members of this House." The hon. and learned member hinged the House, if they were not prepared to arrive at the same conclusion as himself, to consent to the appointment of a committee, in order that the state of the law may be clearly ascertained as to the mode in which the House was required to administer the oath of abjuration.

The ATTORNEY GENERAL contended that the words "on the true faith of a Christian" were a part, not of the form, but of the substance, of the oath, and it was impossible to say that the oath had been taken when these words had been omitted. He thought, therefore, the proposition of the noble Lord at the head of the Government should be adopted in preference to that of the hon. member for Aylesbury.

Mr. J. EVANS contended that the Attorney-General had proved that the words adverted to were formal, and formal only, for their object was to exclude Popish recusants, and it was only by accident they were found to apply very unintentionally to the Jews.

Mr. NAPIER supported the motion of Lord J. Russell.

Mr. AGLIONBY thought that the oaths had been legally taken by Mr. Salomons.

Mr. H. DRUMMOND wished to be informed what sort of an oath the oath of abjuration would be after the lapse of a few years, if the dictum of the lawyers were true, that any one, in any court of justice, might take just so much as he thought proper. He had always objected to the Jews being allowed to become members of our Legislature; but he would not take advantage of a law, however favourable to his own views, which was never intended to operate against the Jews. The oath of abjuration was intended to operate against Jacobites, and not against Jews, and, however anxious to exclude them from Parliament, he would never consent to fire at them from behind a dyke.

Mr. ANSTEY supported the amendment.

Sir R. INGLIS said he regretted that Mr. Anstey had withdrawn his amendment, for he thought that Mr. Salomons, by the course he had pursued, had not only incurred penalties, but had also forfeited his seat, and he hoped this last question would be brought to an issue by some hon. member moving that a new writ be issued for Greenwich.

The House then divided, and the numbers were—

For the amendment	.. ..	71
Against it	.. ..	118
Majority	.. ..	—47

Mr. BRIGHT suggested the appointment of a committee to consider the law on the question, before coming to a division on the motion of the noble Lord at the head of the Government. In order to give an opportunity for Mr. Salomons to be heard against the bill, and to give time for consideration, he moved that the debate be adjourned.

Lord J. RUSSELL said he had stated on the previous night that Mr. Salomons was entitled to be heard, not by counsel, but by himself, at the Bar of the House; but the hon. gentleman had not thought proper to ask to be so heard. There was, therefore, no pretence for adjourning the debate With respect to the appointment of a select committee to inquire, he thought it unnecessary, because a committee had already considered and reported on the law of the case last session in the case of Baron Rothschild.

Sir B. HALL thought that some delay should be allowed, in order to give the electors of Greenwich an opportunity of petitioning the House to be heard at the Bar in support of their representative.

Mr. G. THOMPSON supported the suggestion of appointing a committee of inquiry. The noble Lord, if sincere upon this question, should have made it a Cabinet question, and staked upon it the existence of his Government.

Mr. ANSTEY supported the adjournment of the debate.

The House then divided on the question of the adjournment of the debate, and the numbers were—

For the adjournment	.. ..	69
Against it	.. ..	190
Majority	.. ..	— 121

Mr. G. THOMPSON moved an addition to the original resolution, the object of which was that the House, having regard to the conscientious scruples of Mr. Salomons, would so alter the form of the oaths as to enable him to take it.

Mr. J. A. SMITH hoped that the noble Lord would consent to the postponement of the debate for a month after Thursday, as up to that day a petition would be presented from the electors of Greenwich, praying to be heard at the Bar by counsel in support of the right of their representative to his seat.

Mr. BRIGHT objected to another part of the oath, which kept Lord Clancarty and Lord Bradford out of the House of Lords because they could not swear to what they knew to be false. He knew of several hon. members in that House who said that the House, having regard to the conscientious scruples of Mr. Salomons, would so alter the form of the oaths as to enable him to take it.

Mr. ANSTEY moved that the debate be adjourned.

Mr. BRIGHT supported the motion for the adjournment.

Lord J. RUSSELL commented strongly on the observations of Mr. G. Thompson, who, while he (Lord John) was endeavouring to remove Jewish disabilities, was travelling to America instead of looking after the interests of his Scotch constituents at home. He could not see why the House should not decide upon the question before it without any reference to what may be done by the electors of Greenwich. If they should petition the House, it would become its duty to consider petitions, and act accordingly. He wished it to be understood that he should persevere in seeking to emancipate the Jews, believing that if a bill were sent up to the House of Lords by a very large majority, that House would agree to it, if they believed it was consonant with the feelings of the country.

Mr. BETHEL said the resolution of the noble Lord was a mere piece of bad English, which decided nothing, and would stultify the House in the eyes of the public.

The House then divided, and the numbers were—

For the adjournment	.. ..	59
Against it	.. ..	207
Majority	.. ..	—148

After a very desultory conversation, in which the debate seemed like y to be renewed, Lord John Russell at length yielded a reluctant assent to its adjournment. It was fixed to be resumed on Friday.

The House adjourned at two o'clock.

HOUSE OF COMMONS.—WEDNESDAY.

The House sat from noon to six o'clock.

Mr. George Frederick Young took the oaths and his seat for Scarborough.

A new writ was ordered for Limerick, in the room of Mr. John O'Connell, who has accepted the Chiltern Hundreds.

THE CRYSTAL PALACE.

In answer to Mr. Newdegate, Mr. CORNEWALL LEWIS said that the Crystal Palace was considered by the Custom-house as a bonded warehouse, as regarded the imported articles exhibited therein.

The Sale of Beer Bill, the County Rates and Expenditure Bill, and the Enfranchisement of Copyhold Bill were respectively withdrawn.

The greater portion of the day was occupied in the discussion of the clauses of the Administration of Criminal Justice Improvement Bill, which was eventually passed through committee.

Some progress was also made in the disposal of the clauses of the Valuation (Ireland) Bill.

The Consolidated Fund Bill was read a second time.—Adjourned.

HOUSE OF LORDS.—THURSDAY.

Their Lordships met at five o'clock to hear the Royal assent given by commission to certain Bills. The Lords Commissioners were the Lord Chancellor, the Lord Privy Seal, and the Earl of Carlisle

The following were the public bills which received the Royal assent: Survey of Great Britain, School Sites Amendment, Landlord and Tenant, Prisons (Scotland), British Wine Duties, Customs Duties, Common Lodging Houses, Ecclesiastical Jurisdiction, Highway Rates, Local Searches, Militia Ballots Suspension, Public Works Loans, Lunatics in Asylums or Licensed Houses (Ireland) (No. 2), Turnpike Acts Continuance, Turnpike Trusts Arrangement, Inhabited House Duty, Burgesses and Freemen's Enfranchisement Extension, &c.

More than fifty other bills, local and private, also received the Royal Assent.

The Civil Bills (Ireland) Bill was read a second time, and ordered to be committed.

Lord BERNERS presented several petitions from Leicestershire, complaining of agricultural distress, and took occasion to urge upon their Lordships the necessity of legislating to correct the depreciation which, he alleged, landed property and the industry of the country were undergoing.

Several bills on the table were forwarded a stage, and their Lordships adjourned.

HOUSE OF COMMONS.—THURSDAY.

The House had an early sitting, and met in the New House of Commons at 12 o'clock. Since last year the house has undergone very considerable alterations, which have rendered it a much better room for hearing than it was, and the general appearance was more comfortable and pleasing to the eye.

Several petitions were presented, praying for the retention of the Crystal Palace.

NATIONAL GALLERY.

In reply to a question from Mr. V. Smith,

The CHANCELLOR of the EXCHEQUER said that means had been adopted to secure a site for the future National Gallery. He believed all parties were agreed, that, if for the preservation of the pictures, the present gallery ought to be changed. A commission had been appointed to consider a new site, and it had recommended two, which were now under the consideration of the Government. One of the sites was in Kensington Gardens.

CONSOLIDATED FUND BILL.

This bill, with the appropriation clause, was passed through committee, and the report was ordered to be received to-morrow.

MEDICAL CHARITIES (IRELAND) BILL.

The House then went into committee on this bill, and made some progress with the clauses

The House adjourned from three to five o'clock.

PASSENGERS' BAGGAGE.

Mr. MACKINNON wished to ask the Chancellor of the Exchequer, or the Under-Secretary of State for the Home Department, what obstacles there are to the examination of the baggage of passengers from France in London, instead of at the outports of Folkestone and Dover, on the same principle as is now adopted in France, of examining the baggage of passengers from England at Paris, instead of at Boulogne or Calais?

Mr. C. LEWIS said the matter referred to was now under the consideration of the Treasury, who were in communication with the Board of Customs on the subject.

THE NAVIGATION LAWS.

On the order of the day for the third reading of the Customs Bill,

Mr. HERRIES moved, as an amendment, that an humble address be presented to her Majesty, praying that she will be graciously pleased to direct the proper steps to be taken for giving effect to those provisions of the act 12 and 13 Vic., c. 29 (for the repeal of the Navigation Laws), whereby her Majesty is empowered to adopt towards any foreign country, in which a preference is given, directly or indirectly, to national vessels over British vessels, such measures as may appear to her Majesty justly to counterveil the disadvantages to which British trade and navigation is so subjected. The right hon. gentleman contended that the result of the repeal of the Navigation Laws was a gradual decline of our shipping trade, a reduction of our ships, and an increase of foreign ships in our ports; the advantages of the change in the law being reaped by foreign countries, particularly the United States, which accorded no reciprocal benefit to us.

Mr. LABOUCHERE, in reply, brought forward statements to show that no decrease whatever had taken place in our shipping trade, which had found out new channels of profitable employment, the ports of the United States exhibiting a considerable increase of British shipping since the new system came into operation. In the foreign European ports also—especially those of the Baltic, where most danger was apprehended from the change—the tonnage of British ships had considerably increased.

Mr. G. F. YOUNG supported the views advocated by Mr. Herries.

Mr. WILSON defended the repeal of the Navigation Laws.

Mr. DISRAELI supported Mr. Herries' amendment, but urged the right hon. gentleman not to press it to a division.

Mr. HERRIES ultimately agreed to the suggestion, and the amendment was withdrawn.

The third reading of the Customs Bill was then adjourned to a future day.

The House rose shortly before two o'clock.

PRIZE CATTLE AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, AT WINDSOR.

SHORT HORNS.—CLASS 1.—FIRST PRIZE, £10

SHORT HORNS.—CLASS 1.—SECOND PRIZE, £20.

CHANNEL ISLANDS.—CLASS 3.—FIRST PRIZE, £10.

CHANNEL ISLANDS.—CLASS 1.—FIRST PRIZE, £10.

DEVON.—CLASS 1.—FIRST PRIZE, £40.

HEREFORD.—CLASS 1.—FIRST PRIZE, £40.

SCOTCH POLLED.—CLASS I.—FIRST PRIZE, £10.

PURE ITALIAN BULL.

THE ROYAL AGRICULTURAL SOCIETY'S PRIZE CATTLE. THE ILLUSTRATIONS.

The Cattle which we have selected for Illustration are Class 1, a 4 years and 9 months old short-horned bull, which obtained the first prize of £40, bred by Mr. Henry Lister Maw, of Tetley, near Crowle, Lincolnshire, and exhibited by Mr. Thomas Wetherell, of Kirkbridge, near Darlington. This remarkably fine animal partakes in some degree of the large Holderness breed. In the same class, we give an Engraving of a 6 years and 1 month old short-horned bull, exhibited and bred by the Right Hon. Lord Hastings, of Melton Constable, near Thetford; of the Herefords, an Engraving is given of the bull exhibited by the Right Hon. Lord Berwick, aged 4 years and 6 months. This is a very fine, symerically formed animal, but decidedly too fat. Whether fat or lean, this animal would have looked well, possessing as it does every deserving point, which is more than can be said of one which obtained a prize in the same class—the imperfections of the one alluded to being covered in consequence of being over-fed.

We have already briefly noticed the generally good character of the Devons; and an inspection of the Engraving given this day of the 3 years and 5 mon hs old North Devon bull exhibited and bred by Mr. John Quartley, near South Molton, will show that they have not deteriorated since the Exeter exhibition: this bull obtained the first prize of £40 in the Devon Class.

The show of Channel Island Cattle was very numerous. We have selected for Illustration a 3 years and 6 months old *pure Guernsey* in-calf Cow, bred by Peter Le Page, of St. Martin's, Guernsey, and exhibited by Mr. George Torode of the Forest, Guernsey, which obtained the prize of £10; and a 3 years and 13 days old Channel Islands bull, bred and exhibited by the Right Hon. the Earl of Egmont. Each animal is remarkably fine of its class.

We also th s day give an Engraving of a Suffolk bull which obtained the first prize of £10. It is 4 years and 1 month old, bred and exhibited by Lieut.-General Sir Edward Kerrison, of Oakley Park, Suffolk. This was exhibited amongst the miscellaneous or extra class, in which was also shown a 5 years and 1 month old Italian or Roman bull (see Engraving). The latter animal is a specimen of the cattle which range in the Maremma, the Pontine, and other marsh lands in Italy. An inspection of the Engraving will remind those readers acquainted with ancient sculpture of the resemblance between the animal under notice and that of many sculptured works in the form of friezes, &c., representing sacrifices, processions, &c.

In the extra class of sheep there were some curious animals, such as a pen of Shetland ewes and a Herdwick tup, the latter exhibited by Mr. Robert Kirby, of Coit-house, near Hawkshead, Lancashire. The Herdwicks are a race of sheep found to do the best on our highest English mountains, such as Helvellyn, Coniston, Old Man, &c., in which district they are justly much esteemed. The true kind are remarkable for having 14 rile. Their origin and history are involved in great obscurity. Their introduction into the Lake district is said to have been in consequence of some sixty or seventy being saved from a vessel shipwrecked near Whitehaven, about a century ago, after which they were turned on to the bleak fells, near Wartwater. Their sagacity and hardihood eventually obtained the notice of the flock-owners; and their breeding is now most carefully attended to, as much so as the finest cattle in England. An undergrowth of hair occurs beneath the wool in the Herdwicks—an indirect evidence of their hardy character.

"COLERIDGE'S COTTAGE," CLEVEDON —(SEE NEXT PAGE.)

NEW CATTLE-MARKET AT CROYDON.—(SEE NEXT PAGE.)

Mr. Thomas Beard, of Stowe, Buckingham, nearly made a clean sweep of the prizes awarded for long-horns; and we have the pleasure of remarking, that on no occasion, of late years, has so fine a set of animals in this class been submitted to public inspection.

The Channel Island cattle, commonly known as "Alderneys," but the best of which come from Guernsey and Jersey, were exhibited in numerous force, and of excellent quality.

On the present occasion prizes were given for Sussex cattle, some good specimens of which were forwarded to compete for the various prizes. They are very like the Devons in general character, but possess a larger frame, and when fatted are of heavier weights than the former breed. The most famed of a full-grown Sussex ox is about the best point in the British Islands: the objectionable feature in cattle of this breed is, that the cows yield their milk only sparingly; which, however, is of excellent quality.

Amongst the Scotch horned and Scotch polled cattle there were some very fine specimens. The Welsh, Irish, &c., were a very miscellaneous lot. A 13 years and 2 months old in-milk pure Shetland cow, exhibited by Mr. Jeremiah Linkister, near Lerwick, Shetland, was a very curious animal. Some Brahmin, Suffolk, and other breeds of cattle were exhibited in this class.

The show of draught horses, though not very numerous, was exceedingly good; Mr. Thomas Cattin, of Batley, near Woodbridge, carrying off the two prizes in Class 1, viz. £30 for a 3 years old pure Suffolk stallion, bred by himself, and £15 for a 2 years old ditto, bred by himself.

The hunter stallions were not a very superior lot, though the prize animal (£30), exhibited by Mr. Thomas Grove, of Manor House, Nunmonkton, near York, was a favourable specimen. The class of roadster stallions was far from being so good as was desirable; the prize animal, £15, shown also by Mr. Thomas Groves, formed an exception. The mares and foals were the most indifferent part of the show, a circumstance greatly to be regretted, and which, it is to be hoped, has arisen fromsome accidental disturbing influence of only a temporary character.

The two-year-old fillies were neither numerous or remarkable for excellence.

Sheep.—In all classes of sheep, the animals of the more noted breeds were unusually fine, and in Leicesters, Mr. Sandy, of Holme Pierrepoint, near Nottingham, was more than usually successful. In Southdowns Mr. Jonas Webb had that palm of merit accorded to him which he well deserves, as one of the most persevering and talented breeders in the Kingdom, having obtained seven prizes out of the nine offered for this class of animals, the other two being awarded to Mr. Rigdon, of Hove, near Brighton. The Cotswold continue to carry away the prizes for long-wools—the neighbourhood of Northleach still, as usual, being the favoured locality. In mountain sheep, the prizes were, with one exception, awarded to Cheviots solely. We cannot admit the full justice of this, seeing that animals were exhibited, good of their kind, which will live where a Cheviot would be starved, and where no other sheep than those of a hardier character than the Cheviot could possibly exist. The exceptional case, the prize given to Exmoor sheep, fully merited the award; but, at the same time, it ought to be remembered that the Exmoor sheep could not live on some of the high mountains of the north of England and Scotland.

Pigs.—In the class of pigs, there were more specimens of the larger and middle-sized breeds shown than has been the case of late years. In fact, the examples of good useful farmers' pigs, weighing about ten score at ten or twelve months old, were of a most satisfactory character. The prizes for specimens of the porcine race were distributed amongst persons almost new as competitors for the Royal Agricultural Society's premiums, very few having been heretofore successful.

AWARD OF PRIZES FOR AGRICULTURAL AND HORTICULTURAL MACHINES AND IMPLEMENTS AT THE GREAT EXHIBITION.

GREAT MEDALS.

No. 15.—W. Busby, Newton-le-Willows, for two or four-horse Plough, Horse Hoe on the ridge, Ridging, Corn Drill, and Cart.

No. 135. W. Crosskill, Beverley, for Norwegian Harrow, Meal Mill, Cart, Clod Crusher.

No. 142.—Garrett and Sons, Suffolk, for Horse Hoe, general purpose Drill, four-row Turnip Drill on the flat, improved Hand-barrow Drill, Drill for Grass seeds, Steam-engine Thrashing Machine.

No. 241.—Hornsby and Son, Grantham, for Corn and Seed Drill, Drop Drill, two-row Turnip Drill on the ridge, Oil-cake Bruiser, Steam-engine.

PRIZE MEDALS.

No. 132.—W. Ball, Rothwell, for two-horse Plough.

No. 137.—J. Read, Hartlip, for Cultivator.

No. 140.—Bayliss and Key, Newgate-street, for improved American Churn and Turnip Cutter.

No. 141. C. Burrell, Thetford, for Gorse Bruiser.

No. 145.—Clayton and Shuttleworth, Lincoln, for Steam-engine.

No. 147. H. Clayton, near Dorset-square, for Tile Machine

No. 148.—H. Coleman, Chelmsford, for Cultivator, Expanding Harrow.

No. 152.—C. Garrett, Harbridge, for Chaff-cutter.

No. 153. [illegible] Wood, Wapping, for Cart.

No. 113. [illegible] Hawkins, South Molton, for Horse Hoe.

De Clues, Belgium, for Corn Drill and Roller.

No. 165.—J. J. Duchesne, Asschc-en Rifail, Belgium, for Churn.

No. 199.—M. Gibson, Newcastle, for Clod Crusher.

No. 199.—Gray and Sons, Uddingstone, for Cart.

Harwood, for Meal Mill.

No. 149.—Hensman and Son, Wickham, for Threshing Machine, four-horse Plough, and Corn Drill.

No. 241.—Holmes and Son, Norwich for Threshing Machine.

No. 240. [illegible] Richard, for two-horse AX Plough, four-horse Plough, Horse-rake.

[illegible] D. Lavoisy, Paris, for Churn.

No. 1.11. [illegible] Newington (as inventor), for Top Dressing Machine.

No. 1.1. [illegible] N. Nicholson, Newark on-Trent, for Oil-cake Bruiser.

No. [illegible]urs, Mariinne, Belgium, for Plough.

No. [illegible]some and May, Ipswich, for Drop Drill.

No. 198.—Reeves and Bratton, Westbury, for Water Drill, Liquid Manure Distributor.

No. 198. [illegible]. Samuelson, Banbury, for Turnip-cutter.

No. 228. T. Scragg, Turnpriley, for Tile Machine.

Smith, Stamford, for Hay-maker, Chaff cutter, and Horse-rake.

No. 1. [illegible]. W. P. Stanley, Peterborough, for Linseed and Barley Crusher.

No. [illegible]. Smith and Sons, Bordesley, Birmingham, for Steam-engine.

No. [illegible] Wilkinson, 309, Oxford-street, for Churn.

No. [illegible] Williams, Bedford, for Light and Heavy Harrows.

No. [illegible] A. Wilson, Preston, for Tile Machine.

NOTE. The awards for foreign implements are not yet completed.

16th July, 1851. True extract of the Award Book of Jury IX.

LYON PLAYFAIR, Special Commissioner.

NOOKS AND CORNERS OF OLD ENGLAND.

"COLERIDGE'S COTTAGE," CLEVEDON.

CLEVEDON (so called because of the cliff or cleve here terminating in a dun or valley) is a pleasant watering place on the shore of the Bristol Channel, and about 18 miles west by south of Bristol. Standing for the most part on well sheltered hills, the air is peculiarly mild and soft, and its climate suitable to the valetudinarian or the man of business sighing for temporary relief from the cares of active life. The scenery for miles round is of the most lovely character, extending in one direction over fertile vales and well-cultivated tracts of pasture land to the distant Mendip Hills; in another commanding a bold view of the southern Welsh coast, and in a third looking over the mouth of the Bristol Channel, with an occasional glimpse of a passing sail upon the broad Atlantic beyond. The place offers the usual accommodation for sea bathing.

The sea-coast presents features of romantic interest, in some localities being encircled into walks and craggy bays; in others furnishing a purpose of rocks over which the sea dashes in sheets of foam; in others bordered by a carpet of verdant turf.

Clevedon is rich in geological treasures; and possesses, in the neighbouring caves of Banwell (described by Dr. Buckland, in his "Bridgwater Treatises"), a source of interest to the man of science not to be surpassed by any locality in the kingdom. To the man of letters it has a few suggestive localities; having been the cradle of Coleridge's muse, and lying within sight almost of the favourite haunts of Hannah More. Her cottage, the humble abode of the former poet, is still in existence, and an object of interest to the lovers of pure British song.

NEW CATTLE-MARKET AT CROYDON.

The [illegible]don (thanks to the Board of Health) is now making [illegible] sanitary improvement, and will shortly be well drained [illegible] with water. Among other manifest tokens, we may [illegible] the cattle-market, which has been re-erected on a substantial foundation, with good approaches thereto, well screened from the highway, and provided with ample accommodation for 1400 sheep and pigs, with beds for 200 calves, and stands for 200 head of cattle. The roofs of the sheds are of galvanised corrugated iron, supported on cast-iron columns and cornice gutters; the sheep-pens are of wrought iron, let into granite curbs, and paved with convenient walks, to facilitate the examination of the stock. The Market is well supplied with water from a well and pump in the centre, with tank and troughs; and good drainage is also provided. The site is laid out to allow of the easy extension of the Market, which must be a valuable acquisition to the increasing neighbourhood. It will doubtless continue to be well attended by the respectable butchers from the southern environs of London, and must prove beneficial to the farmers and graziers of Surrey, Sussex, and Kent, being of easy access from the railways traversing those counties.

The works have been carried on with spirited expedition, and completed in about three months, and the Market was opened for business on the 10th instant.

VOLUME EIGHTEEN of the ILLUSTRATED LONDON NEWS is now ready, bound in cloth gilt, price One Guinea, or in paper covers, 10s; published this day, JULY 19, containing nearly SEVEN HUNDRED ENGRAVINGS, 360 of which are relative to the GREAT EXHIBITION. WILLIAM DUNN, Sec.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, JULY 26, 1851.

The Great Exhibition may now be said to have concluded the most momentous phase of its existence since it opened its portals to the admiration of the world. The competition for the prizes is virtually finished. The decisions of the juries were made and recorded on Monday last. On Wednesday the chairmen of committees adopted the second necessary step in the process; and the

results have by this time been made known to the Royal Commissioners. But it is presumed that silence will be recommended, if not altogether observed, till the close of the Exhibition, in order to avoid the heartburnings and disappointments which it was hoped sible to avoid in such a case, and which must evaporate at least in some differences of opinion and complaints. The difficulties attendant upon several of the inquiries were, owing to their nature, very novel, and almost insurmountable; in others, all the varieties of judgment and taste necessarily complicated the questions at issue; but there has been a most laudable devotedness to the subject, and a very universal desire to do justice to the delicate task so patriotically undertaken by men of all ranks and conditions. With regard to further proceedings, we believe that most of these have been relieved from their arduous duties, and only a few permanent jurors retained, who will take into consideration the merits of many competitors who have missed the medals, but whose inventions and productions are nevertheless entitled to honourable mention and distinction. A list of these will be added to the declaration of the higher awards; and it is to be hoped that a fair degree of satisfaction will be generally felt.

The conservative sympathies of the English people were for some months after the French revolution of June, 1848, very strongly enlisted in favour of those Continental sovereigns whose thrones were endangered by the excesses of their subjects. Among those sovereigns, some deserved—and some did not—the kindly interest manifested in their behalf. In the number of those upon whom sympathy was misplaced, must be ranked the King of Naples—a man, whose mis-government was enough to have produced a thousand Mazzinis, to resist it to extremity. In the day of his peril and of family his cruelty was only equalled by his treachery; and when, after a reign of terror, which throws into shade the horrors committed in the worst days of Robespierre and the Convention, he succeeded in establishing his power, neither his cruelty nor his treachery was diminished; but both were continued, even though they lacked the wretched plea of necessity, which might formerly have been urged in their extenuation. From time to time a voice has been raised in Europe to denounce the conduct of this King—always alike in its tone and sound policy, and from the common sentiment of humanity; but hitherto the whole truth, when told, has been received either with doubt or with indifference in this country. A prejudice has been excited against the leaders of the Italian people, who strove to render their country a fit habitation for men with souls; and the excesses narrated against the King of Naples have been put down to the common exaggeration of political opponents. But within the last few days an accuser of a different class has raised his voice against the misgovernment and tyranny of the Neapolitan Sovereign. An English statesman of the highest character, a man with Conservative sympathies, and whose taste and feelings would lead him rather to support than to weaken authority in every country, has publicly denounced the system pursued at Naples, and made an appeal to Europe in behalf of injured humanity, which is certain to excite a strong feeling in every civilized country. Mr. Gladstone, in a series of letters to the Earl of Aberdeen, has laid bare some of the iniquities of Neapolitan misrule. He has narrated facts of which he has been the eye-witness, and, in calling attention to them, has conferred a public benefit. As the recital of one murder is often more horrible than the history of a battle in which thousands of persons are destroyed, the narrative of one case, not worse than the rest, will serve to show what atrocities are committed in Naples, in the outraged name of justice.

Among the supporters of the King of Naples, at a time when he needed support, was one Carlo Poerio, distinguished for his eloquence as a speaker and writer, the blamelessness of his private character, and his attachment, not to extreme but to moderately liberal principles. Of so much value to the Government were his talents and character considered in the perilous days of 1848, that he was nominated one of the Ministers of the Crown. He resigned that post—for what reason we are not precisely informed—but that he did not entirely lose the confidence of the King may be inferred from the fact that his advice was sought after he had ceased to be in the service of the State. In July, 1849, he was accused, with forty other persons, of belonging to the extreme Republican party, and of plotting the murder of the King. On this charge he was brought to trial. Mr. Gladstone was one of the spectators on the occasion, and states that the evidence was inconclusive, the perjury of the witnesses palpable, and the conduct of the judge most indecent and partial. The unfortunate Minister was, however, found guilty, and sentenced to twenty-four years' imprisonment in irons. Mr. Gladstone afterwards saw him in the horrible *bagno* where he was confined, and thus describes the treatment to which he was subjected:—

> In February last, Poerio and 16 of the co-accused were confined in the *bagno* of Nisida, near the Lazaretto. For one half-hour in the week, a little prolonged by the indulgence of the superintendent, they were allowed to see their friends outside the prison. At other times they were exclusively within the walls. The whole number of them, except, I think, one, then in the infirmary, were confined, night and day, in a single room at least 16 paces in length, by 10 or 12 in breadth, and about 10 in height: I think with some small yard for exercise. Something like a fifth must be taken off these numbers to convert paleo into feet. When the beds were let down at night there was no space whatever between them: they could only get out at the feet, and being crammed two and two, only in pairs. In this room they had to cook or prepare what was sent them by the kindness of their friends. On one side the level of the ground is over a top of the room: it, therefore, resisted with damp, and from the 's, tried with long confinement, they declared they suffered greatly.
>
> Their chains were as follows:—Each man wears a strong leather girth round him above the hips. To this are secured the upper ends of two chains. One chain of four long and heavy links descends to a kind of double ring fixed round the ancle. The second chain consists of eight links, each of the same weight as a bright with the four, and this unites the two prisoners together, so that they can stand about six feet apart. Neither of these chains is ever undone, day or night. The dress of common felons, which, as well as the felon's cap, was there worn by the late Cabinet Minister of King Ferdinand of Naples, is composed of a rough and coarse red jacket, with trousers of the same material very like the cloth made in this country from what is called devil's dust; the two are nearly black in colour. On his head he had a small cap, which makes up the suit; it is of the same material. The trousers button all the way up, that they may be removed at night without disturbing the chains.
>
> The weight of these chains, I understand, is about eight rotoli, or between 16 and 17 English pounds, for the shorter one, which must be doubled when we give each prisoner his half of the longer one. The prisoners had a heavy limping movement, much as if one leg had been shorter than the other. But the punishment suffering in this case arises from the circumstance that here we have men of education and high feeling chained incessantly together. For no purpose are these chains undone; and the meaning of these last words must be well considered, as they are to be taken strictly.

To have condemned the unhappy Poerio to death would have been mercy compared with such unmanly cruelty as this. Surely Englishmen will no longer wonder that there are Italians who have dreamed of, and conspired for, the liberty of their country. When Naples is thus governed, and when Rome, under the influence of the "benign" Pio Nono, is in a condition even worse; and when an Italian is not even allowed to cross a walking-stick, lest he should be tempted to knock down with it a foreign or domestic oppressor; it is not at all surprising, that in their own country, or in exile, there should exist Italians, who only desire the removal of the French from Rome, to try their hands at the re-constitution of Italy. Such governments as those of Naples are the worst fomenters of revolution.

FOREIGN VISITORS TO THE EXHIBITION.—The Swedish war-steamer *North Star* has arrived in the East India Docks from Gottenburg. She has brought 180 passengers from Sweden for the express purpose of visiting the Great Exhibition of the Works of Industry of all Nations in Hyde Park.

Sir John K. Halderfield has forwarded a cheque for 100 guineas towards the completion of the east window of Redcliffe Church, Bristol.

COURT AND HAUT TON.

THE COURT AT OSBORNE.

Her Majesty and the Prince Consort, with the youthful members of the Royal Family, have been enjoying the retirement of their marine retreat since Friday last.

The Royal yacht, *Victoria and Albert*, is at anchor in Cowes Roads, in readiness to receive the Court in the event of her Majesty desiring an excursion by sea. The unfavourable weather during the week has hitherto confined the Court to the park and grounds of Osborne.

Her Royal Highness the Duchess of Kent arrived at Osborne on Wednesday evening, on a visit to her Majesty and the Prince Consort.

Lord Ward has left London to join Lady Ward at Homburg.

We are gratified to learn that Lady John Russell, who has been seriously unwell, is going on favourably, and that all danger is now considered over.

Lady Blantyre gave birth to a son and heir, on Thursday last, at Erskine House, N.B.

MARRIAGE IN HIGH LIFE.—The marriage of Lady Louisa Murray, only daughter of the Earl of Mansfield, with the Hon. George E. Lascelles, third son of the Earl of Harewood, was solemnised on Monday, by special license, at Highgate Church.

METROPOLITAN NEWS.

THE CITY OF LONDON AND THE JEWS.—On Thursday a meeting of the electors of London took place at the London Tavern, on the invitation of Baron Rothschild, to consider what steps should be taken in consequence of the Lords having rejected the Oath of Abjuration Bill. Raikes Currie, Esq., presided; and resolutions were passed declaratory of the opinion of the meeting that the House of Peers, by rejecting a measure five times passed by the House of Commons, had "strained the powers of the constitution to an unexampled and dangerous extent;" calling upon the Ministers to make the measure a Cabinet question, and to "stand or fall by it;" and that the cause of removing the Jewish disabilities to which the city of London stood pledged, would be best served by Baron Rothschild continuing to hold his seat. A petition was also agreed to the House of Commons, calling upon them to adopt the resolution passed last session, excluding Baron Rothschild, or that he might be heard at the Bar against such exclusion. In the course of the proceedings Alderman Salomons stated that he had been served with two writs for penalties for sitting in the House; and, should he be found guilty, he would not only have to pay the penalties of £500 for each vote, but in the terms of the statute would be considered a "pollah recusant," and deprived of all civil rights and liberties. A vote of thanks to the Chairman concluded the proceedings.

HIGHLAND FANCY DRESS BALL.—The usual annual fancy dress ball, in aid of the funds of the Scottish Hospital and the Royal Caledonian Asylum, took place on Wednesday night, at the Guildhall, the decorations of which remained in the same state as they were on the occasion of the Queen's state visit a fortnight previously. Most of the company were in Highland costume, or in naval, military, or fancy dress; and between eleven and twelve o'clock, when the large hall was crowded, the effect was extremely brilliant and animated. The children of the Caledonian Asylum, numbering 51 girls and 43 boys, were stationed on either side of the orchestra, in Highland costume.

SOCIETY OF THE FRIENDS OF ITALY.—Under this title an association has been established in London, having the following objects in view:—"By public meetings, lectures, and the press—and especially by affording opportunities to the most competent authorities for the publication of works on the history of the Italian national movement—to promote a correct appreciation of the Italian question in this country. To use every available constitutional means of furthering the cause of Italian national independence in Parliament. And generally to aid, in this country, the cause of the independence, and of the political and religious liberty of the Italian people." All persons agreeing with the objects of the society are to be eligible as members, on enrolling their names and paying a small annual subscription.

HORTICULTURAL FETE.—The same ill fortune as to weather which has attended the Horticultural Society in its *fêtes* this season, was likewise experienced on Saturday, but it did not prevent very many persons from profiting by the attractions offered to them. As on the last occasion the special boon was the American exhibition, so on this it was permission to enter the grounds of the Duke of Devonshire, the president. The unpropitious state of the weather rendered the more to be regretted, as the show was a very good one, the plants in fine order, the colours clear, and the light just such as to set them off to the best advantage. The fruit show has, perhaps, for quantity and quality, not been surpassed. There were, as usual, the regimental bands present, viz., the 1st Life Guards, the Royal Horse Guards (Blue), and the band or one of the household regiments; and the selections of music, which were in great taste, were admirably performed.

FETE AT THE BOTANIC SOCIETY'S GROUNDS.—With the fatality which appears most provokingly to attend the *fêtes* of the Botanic and Horticultural Society, Wednesday, the day appointed for the conversazione to the distinguished foreigners, and others connected with the Great Exhibition, at the gardens of the Botanic Society, was dull and miserably wet. Notwithstanding, however, the unfavourable state of the weather, there was a tolerably good attendance of visitors, among whom was a large proportion of foreigners, who seemed exceedingly pleased with the grounds. The *Victoria regia* House was a point of considerable attraction, as one of the largest plants here in full flower was greatly admired, and the extremely cellular nature of the stem of the plant struck considerable notice. The bands of the 1st Life Guards and 17th Lancers were in attendance.

PEACE CONGRESS.—On Tuesday the sittings of the Peace Congress commenced at the large room of Exeter Hall, which was crowded, the galleries and centre of the hall being filled with ladies. Sir D. Brewster, F.R.S., presided, and was supported by Mr. Cobden, M.P.; Mr. J. S. Smith, M.P.; the Rev. Mr. Burnett, and delegates from all parts of Europe, Washington, and other portions of the United States, as well as from Paris, Belgium, and other Continental countries. Delegates were also present from Scotland, Ireland, and the principal cities and towns of England. The delivery of speeches, and passing of resolutions in accordance with the object of the Congress, formed the business of the several meetings.

BRITISH AND FOREIGN ANTI-SLAVERY SOCIETY.—On Monday evening the annual meeting of the friends and promoters of this society took place at Exeter Hall. Mr. Samuel Gurney took the chair, and observed, in opening the proceedings, that there never was a period in which there was greater necessity for the exertions of this society than at the present moment. He expressed his belief that the British colonies were beginning to recover themselves under the free-trade system, and would soon be able to contend advantageously with those countries in which slavery continued to be encouraged. He was much gratified by the speech made by Lord Palmerston a few nights ago on the subject of the slave trade; a subject which those who were interested in this cause, that, notwithstanding the prospect held out by his Lordship of a speedy termination to the present system of slavery, the committee of the society must persevere in the work they had undertaken.—Mr. T. Candler, Mr. E. Thomas (of Bristol), Mr. G. W. Alexander, and several other speakers, including foreign and coloured gentlemen, subsequently addressed the meeting, and the proceedings terminated.

KING EDWARD-STREET RAGGED SCHOOLS.—On Wednesday afternoon the opening of this institution took place in the presence of the Earl of Shaftesbury, who presided on the occasion, the Duke of Greenwich, and a very large number of ladies and gentlemen interested in the moral and industrial training of the thousands of ragged children that abound in the east of London. The building which is henceforward to be devoted to this most philanthropic purpose has been erected in the pointed Elizabethan style, in Albert-street, Baxter-street, Spitalfields. The total outlay, including a large plot of freehold land, has amounted to about £5000, but it is estimated that £2000 additional will have to be spent on furniture, fittings, &c., in order to render the working of the establishment complete. About £2000 of this sum has been subscribed, leaving £1500 still to be provided. The new school and class room will accommodate 500 children. The basement story is intended as a school for infants, and a scullery and laundry for the girls. The first floor will be devoted to the purposes of genera education, and the upper story will consist of workrooms and dormitories for 40 youths of both sexes. The building, which has been finished in a substantial form, is eminently adapted for the purpose for which it is designed. It is expected that its annual expenditure will range somewhere between £700 and £800. To the opening a large number of the friends of the new institution sat down to tea, and another public meeting was held to celebrate the opening.

THE PATENT LAWS.—On Monday a deputation from the National Patent Law Association waited upon the President of the Board of Trade, Mr. Labouchere. Alderman Sidney, on behalf of the deputation, said the members of the association were not opposed to the general feature of the Bill now before Parliament, but they considered that some of the clauses should be amended. For instance, the clause of the universal novelty of an invention was like to lead to endless litigation, whilst the term of provisional protection was too short. An inventor ought to have time to experiment upon his invention before he spent his money in a patent, and judicial proceedings for infringements of patent rights ought to be simplified and rendered more certain. Correspondence and the bill had been addressed from the House of Commons, where the cause referred to had received great consideration. It appeared to him unjust to grant a patent for an invention imported from another country to a person not being the real inventor. Mr. Gompertz said, the clauses as they at present stood would lead to endless litigation; inasmuch as a person might take out a patent in England, and if a paragraph appeared in a foreign journal, only a few days before, the law would deprive that man of his patent right, although the Government had taken his money. In case of legal proceedings, if foreign evidence was brought forward by the plaintiff, foreign evidence must also be brought forward by the defendant. Vote would be very expensive; whereas all the Continental powers protect importations of inventions. Mr. Labouchere acknowledged that such was the case, and was glad that the deputation had brought the matter forward. The right hon. gentleman listened with great attention to the several statements of the deputation, and promised to give the subject every consideration.

ROYAL COLLEGE OF PHYSICIANS.—The President and Fellows of the Royal College of Physicians gave their second *soirée*, at the College, Pall-Mall East, on Wednesday evening, which was attended by a large number of gentlemen, both native and foreign, distinguished for their scientific attainments. The proceedings of the evening were of a most interesting and gratifying nature.

ST. THOMAS'S HOSPITAL.—On Thursday the annual distribution of prizes to the pupils of the Medical School took place at the Hospital; the Right Hon. the Lord Mayor, Sir John Musgrove, Bart., presiding. Dr. Macmurdo, Dean of the Medical School, having read a report, in which he described the state of the school as most satisfactory, there being a like increase in the number of the pupils and in their attention to the duties of their classes, a number of classical, mathematical, and medical scholarships, medals, and other prizes were distributed to the successful candidates.

DEPTFORD-GREEN NEEDLEWOMEN'S SOCIETY.—On Wednesday, a special meeting of this society was held at its house, 75, Newman-street, Oxford-street, Alderman Farebrother in the chair, to consider the position of the body in relation to the secretary, Mr. Roper. The meeting lasted four hours, and at the close it was resolved to dismiss that officer, and to attempt to re-establish the society, which has lapsed into a state of languor and inefficiency.

CONSECRATION OF CHRISTCHURCH, KENSINGTON.—The newly erected church of Christchurch, Victoria-road, Kensington, was consecrated by the Bishop of London on Wednesday morning. The edifice has cost about £5000.

FOREIGN CONFERENCE AND EVANGELISATION SOCIETY FOR 1851.—This is one of the numerous societies which have grown out of the Great Exhibition, having for its special object the supply of means of religious worship according to the Protestant faith, Bibles, tracts, &c., to foreigners visiting London. The first report, just published, states that the society has eleven agents employed as *colporteurs*, and provides, with the aid of a succession of *pasteurs* from the Continent, fourteen religious services weekly in seven different places. The offices of the society are at 47, Leicester-square.

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.—On Thursday the half-yearly meeting of this company was held; S. Laing presiding; when the report, recommending a dividend at the rate of £4 10s. per cent., was adopted; all paid up D shares converted into stock, and the forfeiture of certain shares in arrear of calls confirmed. A vote of thanks to the directors concluded the proceedings of a perfectly unanimous railway meeting.

SMITHFIELD MARKET REMOVAL BILL.—The committee of the House of Lords on this bill on Wednesday deemed the preamble of the bill to be proved, with the following provisos:—"The City are entitled to compensation, to be calculated on an average of five years of the tolls prior to its closing should the site become valuable and built on; the tolls to make up the deficiencies as in clause 50 of the Islington Market Bill."

ROYAL NAVAL BENEVOLENT SOCIETY.—A general meeting of the governors and friends of this institution was held on Monday, at the Thatched House, St. James's; the Right Hon. Lord Radstock in the chair. It appeared from the report that this society, which was instituted for the purpose of ameliorating the lot to officers of the navy, their widows and families, under circumstances of misfortune, sickness, and consequent distress, had awarded last April the sum of £868 to seventy-eight applicants, in sums varying from £5 to £20. The report of the committee appointed at the last meeting to inquire into the duties of the secretary, &c., was then read, recommending the appointment of an assistant, and other slight alterations in the rules of the society. The receipts for the last quarter amounted to £1542 3s. 7d., and the disbursements to £951 18s. 1d., leaving a balance of £590 5s.

BRITISH ORPHAN ASYLUM.—The half-yearly meeting of the governors and patrons of this society was held on Monday, at the London Tavern; Captain Hall in the chair. It appeared from the report, that up to January last 95 boys and 36 girls had been about the average number of children in the asylum; but, in consequence of the increased number of applicants, 29 more had been admitted. The committee referred with much satisfaction to the practical efforts made to place the education of the children on an improved footing. They had felt the importance of providing a wholesome and efficient system of instruction, and paying the most careful attention to their mental and moral culture. The receipts for the last half-year amounted to £4063, and the disbursements to £2705, leaving a balance of £1345, of which they had lent the sum of £1000 to the building fund. The report was adopted, and eight children out of twenty-eight candidates were elected.

BLACKFRIARS BRIDGE.—In consequence of a continued subsidence of one of the piers of this bridge, it is the intention of the committee who have the control of the works shortly to stop the carriage-way for a brief period, in order either to lessen the superincumbent weight, or afterwards, if the plan recommended is no more, to load it so as to drive the foundation timbers and stonework down to the bed of clay a short distance below. The strong wooden centrings lately put up under the two arches which spring from this pier, are capable to be used without danger, in the event of the foundation sinking, until it reaches the clay, upon which no doubt is entertained that all future movement will cease. The wooden railing lately raised in front of the parapet was to prevent the public from observing the gaps left in the stone-work; but it is impossible not to perceive that the mischief is still going on, from the unseemly hollow in the roadway. The pier has been sunk over 4 feet since the erection of the bridge, but its decay has been accelerated by the gradual deepening of the bed of the river since the removal of the old London Bridge, and by the greatly increased heavy traffic on the roadway above. The recommendations of the committee, even if sound, would be scarcely sufficient. The report of the special commission on Westminster Bridge will probably be made public in a short time, and it may be expected to give useful information, which may be applicable to Blackfriars. It is to be hoped that, although the appearance of the structure is threatening, there is at present no danger whatever.

ROBBERY AT THE GREAT EXHIBITION.—On Wednesday, information was circulated throughout the Metropolitan and City Police Stations that a man in the employ of the King had been plundered of a silver medal of the Royal Dublin Society, 1844; a gold medal of the Dublin Society, 1851, with the name of Bradford on both; and some razors, marked "Braidford, Colonel, servant to H.R.H. Prince Albert." A second case was plundered of a silver medal of the same society.

FIRE.—On Tuesday night, about a quarter-past eleven o'clock, a fire of very large and alarming character broke out in one of the newly-erected houses belonging to Mr. Hutchinson, builder, in Morton-place, Pimlico. Before the flames could be managed the premises in which they began were nearly gutted, the only portions left being the outer brick walls. The origin of the fire is not precisely known, but the prevailing opinion of the inhabitants was that it was the work of an incendiary.

MELANCHOLY ACCIDENT.—Mrs. Rowe, the wife of Mr. Rowe, auctioneer, 73, Chapman-street, was taking an afternoon airing at four o'clock, on Monday, along the New-road, in a pony phaëton, driven by a groom, when the animal became restive and unmanageable, and ultimately ran away towards Whitechapel. The carriage of Mr. Christie, M.P., with the honourable gentleman in it, and an omnibus drove up in an opposite direction, when Mrs. Rowe's pony ran so furiously against the former, that the phaëton and pony were whirled by the concussion to the opposite side, close to the omnibus, where Mrs. Rowe was flung head foremost to the ground with such violence, that, after falling upon her face, she rebounded, falling again in such a manner that her neck was shattered. On being raised the unfortunate lady was quite dead. The groom, although thrown out, sustained but a few scratches. The pony and phaëton were scarcely injured. Deceased was sixty-four years of age.

BIRTHS AND DEATHS.—For the week ending Saturday last, the births of 719 boys and 668 girls, in all 1407 children, were registered in the metropolis. The average number in six corresponding weeks of 1845-50 is 1244. The deaths were 873. In the ten corresponding weeks of 1840-50 the average number of deaths was 975, or corrected for increase of population, 1073, compared with which the 873 deaths of last week exhibit a great decrease. But it is to be observed that cholera had made much progress at this period in the year 1840; hence the average mortality as now stated is higher than a normal state of the population would have produced. The mortality of London last week is proved to only half its sum at a time when cholera had begun, but is greater than what prevails in districts where more favourable conditions of health exist.

METEOROLOGICAL OBSERVATIONS.—The mean height of the barometer in the week was 29.640 inches, at the Royal Observatory, Greenwich. The mean temperature was 68.1°, which is 4° less than the average of the same week in ten years. The daily mean was below the average on every day of the week, and on Thursday fell to 54.9° or 7° below it.

The Enfranchisement of Copyholds Bill, brought into the House of Commons by Mr. Aglionby, Mr. Sheffo Addr, and Mr. Hobhouse, to effect the compulsory enfranchisement of lands of copyhold and customary tenure, has been printed. The bill proposes that manorial rights should be made subject to commutation by the copyhold commissioners on the application of either the lord or the tenant, whether the other assent to the commutation or not. The provisions made for compensation, &c. are similar to those already agreed upon.

EXTRAORDINARY RACE.—During the next week, a trial of speed is to take place on the Great Northern Railway between two engines—the one built by Messrs. Wilson, of Leeds, called the Jenny Lind, now working on the Great Northern line, and the other built by Messrs. Hawthorn, of Newcastle, working on the South-Eastern line between London and Dover. Each engine is to draw the carriages and a break van, and the course is between London and Boston, distance 107 miles. The quantity of coke consumed by each will be taken into consideration. This race is exciting some interest in the engineering world.

RE-DISCOVERY OF A VOLCANIC ISLAND.—An island, about 120 feet high and 2000 feet in circumference, suddenly sprang up in 1831, between Sicily and La Pantellaria. It disappeared about a month after, and, at a later period, even the sounding lead could give no indication of its existence; but vessels passing over the place it had formerly occupied, would sometimes feel a sort of shock, which showed that it was of volcanic origin. In March last, however, the French vessel *Etoile*, which was taking soundings in the vicinity, discovered some traces of its existence; and we now learn from Naples, that, in the course of last month, H.M.S. *Scourge*, Captain Kerr, verified the truth of the preceding observation, and further discovered that the island, which has been christened "Isola Giulia," was only nine feet under water. Captain Kerr had a pole, with a streamer and an inscription, set up on the spot.

The local papers mention a considerable mortality amongst horned cattle in Tipperary, from diseases of the lungs.

F I N E A R T S.

EXHIBITION OF THE NEW SOCIETY OF PAINTERS IN WATER-COLOURS.—A SCENE IN CALABRIA.—"SUNSET."—BY CHARLES VACHER.

ITALY—LA SALTARELLA.

THIS highly picturesque work is one of Mr. Charles Vacher's contributions to the present Exhibition of the New Society of Painters in Water-Colours, in Pall-mall; and we are happy to add, the ready recognition of the great merit of this picture appears in the word "Sold" affixed to it.

The scene is the grounds of an Italian inn, shaded by luxuriant foliage upon lofty trellis-work. Everything around denotes ease and enjoyment. The couple at the table are happy over their flask; there is a gossiping pair at the window, and at the wall beneath. Still more at ease are the various conversational groups upon the ground; and in the middle distance a gay couple are dancing "La Saltarella." Beyond them is a charming picture of bright blue water, rugged mountains, and cerulean sky. The composition is throughout clever, and the colouring sparkling and characteristic throughout.

The second Illustration is from Mr. O'Neil's only contribution (514) to the present Exhibition of the Royal Academy, in whose catalogue it is thus designated:—

"That night the King (Ahasuerus) could not sleep, and he commanded the chronicles to be brought; and the scribes read them unto the King.

"Now Haman was in the court, coming to speak to the King to hang Mordecai on the gibbet that he had prepared for him."—*Esther*, v.

The composition of this picture is admirable; the troubled King is listening to the scribes, surrounded by luxurious accessories. It is night, and the stars glimmer in the firmament; but the moon is half obscured by a cloud, emblematic of the waning fortunes of Haman, who is advancing through the court; and the gibbet completes the narrative. The picture is, altogether, remarkably well painted.

DUMAS AND DAGUERRE.—In 1827, M. DUMAS was lecturing in the Theatre of the Sorbonne, on chemistry. At the close of his lecture a lady came up to him and said, "Monsieur Dumas, as a man of science, I have a question of no small moment to me to ask you. I am the wife of Daguerre, the painter: for some time he has let the idea seize upon him that he can fix the images of the camera; do you think it possible? He is always at the thought: he can't sleep at night for it; I am afraid he is out of his mind; do you, as a man of science, think it can ever be done, or is he mad?" "In the present state of knowledge," said Dumas, "it cannot be done; but I cannot say it will always remain impossible, nor set the man down as mad who seeks to do it." This was twelve years before Daguerre worked his idea out, and fixed the images; but MANY a man, so haunted by a possibility, has been tormented in a madhouse. This has been related within the last few days by Dumas.

EXHIBITION OF THE ROYAL ACADEMY.—THE CHRONICLES READ TO AHASUERUS THE KING.—PAINTED BY H. O'NEIL.

MESSRS. HUNT AND ROSKELL'S JEWELS IN THE GREAT EXHIBITION.—(SEE NEXT PAGE.)

JEWELLERY, REAL AND FALSE.

APROPOS OF A GROUP OF JEWELLERY BY HUNT AND ROSKELL.

In the Supplement which accompanies the present Number, we give an illustration of the magnificent Diamond and Ruby Stomacher exhibited by Messrs. Morel in the Crystal Palace; and in the present sheet we give a cut up of Jewellery selected from the costly and elegant assortment exhibited by Messrs. Hunt and Roskell. The jewel trade of England may be said to be fairly represented in its highest perfection in the specimens comprised in these two Engravings, which, for gorgeous and substantial magnificence of material and tasteful arrangement, may fearlessly challenge comparison with anything of the kind from any other part of the world.

We have elsewhere described Messrs. Morel's bouquet, and we shall presently very briefly enumerate the principal features in the group presented by Messrs. Hunt and Roskell, observing that, in cases of this kind, wor's can give but a faint idea of the brilliant reality, a reality which, to many in the humble every-day walks of life, must be totally inconceivable until presented to the mind by absolute ocular proof. And let us go over, at least, and examine these baubles; for, although ultimately intended for mere personal decoration, or perhaps the gratification of personal vanity, these specimens are really worthy of some attention as works of art; and it is seldom that we have an opportunity of examining the costlier productions in the precious metals and stones under such favourable circumstances. All that glitters at a Lord Mayor's Show, or civic ball, ay, or in the crowded saloons of the nobility, is not gold, diamonds, rubies, emeralds, sapphires, &c., but very often unadulterated pinch-beck and paste; whereas, in these works exhibited among the wonders of day in the Glass Palace, all is reality; all the choicest specimens of their kind, all fashioned in the most exquisite taste, and with the perfection of workmanship. Once seen and examined, therefore, these productions become standards of excellence in the mind's memory—dazzling standards bright as truth—which, if they do no more, will do good in putting many of our wives and daughters out of conceit with the tawdry trumpery in which they have sometimes weakly bedizened themselves, and suggesting to them the propriety of adorning themselves after a purer and more genuine fashion for the future. *Magna est veritas*, and falsehood is bad, not only in the cases of the perjured testimony in court, and the forged paper, but even in the unreal pretensions of a piece of makebelieve jewellery. The injury to society in the case, and the offence, is not the same in magnitude; but still society is injured, is insulted by such mockeries, and the self-respect of the wearer is undermined also, by the mere habit of sailing under false colours, to say nothing of the necessity which he or she is sometimes under, and constantly liable to, of having to accredit the false glitter by a lie, or some mean manœuvre of prevarication or evasion. Let it not be said that we are unduly sententious when talking of such a trifle as a diamond ornament; we submit that we are neither out of reason nor out of season in the few remarks we have been led into upon this subject, and that the moral and intellectual results to be expected from the Grand Industrial Exposition of 1851 are neither few nor unimportant; and by no means the least valuable of them, as we anticipate, will be the discarding of vicious, vulgar and false schemes of external adornment, and the adoption of simpler and juster principles of decoration—principles based upon a recognition of the beauty of truth.

To return to Messrs. Hunt and Roskell's jewels. The principal and all-attractive object in the group is a splendid diamond stomacher, exhibited as a specimen of the art of diamond setting. The flowers (comprising the anemone, rose, carnation, &c.) are modelled from nature. This brilliant structure divides into seven different sprigs, each perfect in design; and the complicated flowers, by mechanical contrivances, separate for the purpose of effectual cleaning. In the production of this costly work nearly 6000 diamonds have been employed, the largest of which weighs upwards of 10 carats, whilst some of the smallest, in the stamens of the flowers, would not exceed the thousandth part of a carat.

The next object of importance is an ornament for the head, composed of branch coral, ornamented by leaves of enamel and gold, enriched with diamonds—a very elegant production, of chaste effect.

At the sides are several brooches; bracelets of the same kind, enriched with diamonds and other precious stones; not the least curious amongst them being some specimens of ear-rings in emeralds, diamonds, carbuncles, &c., after the sculptures from Nineveh.

NATIONAL SPORTS.

The most aristocratic, and, in all respects, the best race meeting of the year, will commence on Tuesday next, and terminate on Friday, each day having a prominent feature in some rich or heavy betting event, and the *ensemble* being favourable for excellence of sport, while those who wish to see racing in perfection will do wel. to patronise one of the specials from London-bridge. There will be a small meeting on Wednesday at Downham Park, and one on the same day at Knutsford, formerly a place of some note.

The cricket fixtures for the week stand as follows:—Monday, at Lord's, Brighton, Sheffield, Peckham, and Taunton; Wednesday, at Lord's; Thursday, Lord's and Chesilhurst; Friday, Leeds.

BOATING!—Monday, at Southwark; Tuesday, at Wapping; Wednesday, at Weymouth; Thursday, on the Humber; Friday, Doggett's Coat and Badge, and the St. George's Yacht Club Regatta at Dublin.

TATTERSALL'S.

THURSDAY.—The only move this afternoon was on the Goodwood Stakes, for which Backlister, as often a favourite and so rarely a winner, became second lu command. The general betting was dull.

CHELMSFORD RACES.—TUESDAY.

The CHELMSFORD STAKES of 10 sovs each, with 50 added.—Mr. C. Du Cane, jun., nd. b. ipidity (Sabin), 1. Mr. W. Davis, jun., nd. Joe o' Sot (Hornsby, jun.), 2.

SWEEPSTAKES of 5 sovs each, and 50 added. Mr. Foster's Firebolt (Charlton), 1. Mr. Mosser's Grasshopper (Bartholomew), 2.

The HYLAND STAKES of 10 sovs each, and 50 added.—Mr. Drinkald's Grey Tommy (Ford), 1. Mr. Morris's Fidgetty Girl (Bartholomew), 2.

The REVIVAL STAKES of 5 sovs each, and 50 added.—Mr. Morris's Fidgetty Girl (Atherton), 1. Mr. Johnstone's Anchbone, 2.

WEDNESDAY.

The CUP STAKES of 10 sovs each.—Mr. Barrow's Abdallah (S. Rogers), 1. Sir T. Tyrrell nd The Baroness (Simpson), 2.

HER MAJESTY'S PLATE of 100 guineas.—Capt. Haworth's Baroness (Simpson), 1. Mr. Taylor's Michael Brunton (Hackett), 2.

TOWNSMEN'S HALF STAKES of 5 sovs each, and 25 added.—Mr. Foster's Firebolt (Charlton), 1. Lord W. Powlett's Fochabers (Hammond), 2.

MARLBOROUGH RACES.—TUESDAY.

The MENNERS' PLATE of 25 sovs, added to a Sweepstakes of 3 sovs each.—Mr. Land's Nugtcap (Treen, jun.), 1. Mr. Jones's Ambrose, 2.

The LADIES' PLATE of 25 sovs, added to a Sweepstakes of 3 sovs each.—Mr. Wearing's Gloom (Pearce), 1. Mr. Land's Nugtcap, 2.

The SAVERNAKE FOREST (handicap) STAKES of 10 sovs each.—Sir J. Hawley's Bacchanalian (Marsden), 1. Mr. J. Day's Axis, 2.

SWEEPSTAKES of 10 sovs each, with 25 added.—Sir J. Hawley's Pluck (Marsden), 1. Mr. Gulliver's Lady Blanche, 2.

The TOWN STAKES of 5 sovs each, and 25 added.—Arlette (Burns), 1. Nightcap, 2.

GUILDFORD RACES.—WEDNESDAY.

HER MAJESTY'S PLATE of 100 guineas.—Mr. Farrance's bk c by Cardinal Puff, out of Peggy (Goater), 1. Mr. J. S Douglas's Don Pedro (Abrahams), 2.

MATCH: 10 sovs.—Mr. W. Taylor's Princess (Ownor), 1. Mr. White's Miss Frimley (Owner), 2.

THE LEANDER CLUB COAT AND BADGE.

The contest for the coat, badge, and freedom, presented by the Leander Club to watermen's apprentices whose time expires in this and next year, came off on Tuesday evening, and attracted a great assemblage. The race was in three heats, with eight competitors, and the course from Putney to Hammersmithbridge.

GRAND HEAT.—P. J. Chandler (red and white), 1. H. J. T. Bell (green), 2.

SCULLERS' MATCH BETWEEN T. COOMBES AND G. MELVIN.—Those young men—watermen's apprentices—rowed on Monday evening, for £5 a side, from Putney-bridge to the ship at Mortlake. Melvin had a slight start, but only retained it for a few minutes, his opponent rowing by him in good style off the Star and Garter. From this point Coombes increased at every stroke, and won easily by a great distance.

THE THEATRES.

HER MAJESTY'S

Verdi's "Ernani" was first produced in this country, under Costa's direction, in the season 1845, and was sustained by Madame Rita Borio, Mortani, Botelli, and Frassacti. In 1846 it was done under Balfe's *bâton* by Madame Poini, Castiglione, Rundell, and Formaseri; in 1847, by Madame Castellan, Praschini, Superchi, and Bouché; in 1848, by Mdlle. Cruvelli, Cuzzani, Gardoni, and Belletti; in 1849, by Madame Giuliani, Berdas, Gardoni, and Belletti; in 1850, by Mdlle. Parodi, Sims Reeves, Ferrari, and Belletti; and now in 1851, it was performed on Saturday night by Mdlle. Cruvelli (*Elvira*), Sims Reeves (*Ernani*), Coletti (*Don Carlos*), and S apini (*Ruy Gomez de Silva*). This is, therefore, the twelfth appearance of "Ernani;" and almost every year, be it remarked, this work has been given nearly as often as the most popular production of any other composer. One would be blind indeed not to perceive that the means here have achieved here a solid and legitimate success, which no superiority in the cast has ever been able to effect, dependant as this lyric drama essentially is on the powerful construction of its concerted pieces for its main source of attraction. At the period of its first production, whilst we protested against the puffery of Verdi's parasites, we were quite ready to enter the lists against the wholesale condemnation of his indiscriminate detractors. If "Ernani" had not been as full of beauties as it is of defects, it could not have stood its ground as it has done, and as it will do, despite of all bigoted and pedantic opposition. "Ernani" owes is the music of effect, even if there be little scientific combination—it is imagery which appeals to the senses, I not to the intellect. And who is there competent to lay down rules, to dictate to me what are really the right pictures of the passions, as depicted by sound? Verdi's conceptions partake more of musical sensation than of the intellectuality of art But what then? If the composer obtain the aspirations of lofty tragedy, he embodies the vivid attributes of impassioned melodrama. Admitting his many faults—his poverty of form, his want of true grandeur, and pertinacity in the melody of the *sole*, his noisy orchestration, his unisonous artifices, and abuse of the crescendo—let the balance be fairly struck, or the beauties of his style, the possession of lively fancy, and of a vivid perception of dramatic colouring. If there be a dearth of novel musical ideas, Verdi never fails to move his auditory by his passion, feeling, and vigour in the *ensembles*, and by a skilful colouring of the ens-cendos; as, for in-tance, in the trio, "Tu se, Ernani;" the sestet in E flat, "Vede come il bon vegliamo" in the first act; the clever trio, in three four time, "Oro supremo," in the last act; the fine finale to the first melody; and the streets of the finale in the second act; the large, in E minor, of the concerted piece of the conspiracy; and the magnificent finale of the third act, beginning with the large in D minor, "Oh, somma Carlo," with harp accompaniment, and ending with the glorious burst in the major, with the high notes of the soprano thrilling above the tenor, which was unfortunately secured last Saturday. To deny Verdi, with such examples of power as we have just cited, any ability at all, is monstrously unjust. His operas produced here are "Nabucco" (Nino), "I Lombardi" (Jerusalem), "Ernani," "I Due Foscari," "Attila," and "Masnadieri;" his works not yet heard in this country are—"Giovanna d'Arco," "Alzira," "Macbeth," and "Luisa Miller." Since the death of Donizetti, Verdi's star in Italy has been exclusively in the ascendant, and until another composer shall arise to restore the pure art of vocalization, neglected by Verdi for violent contrasts in declamatory phrases on the extreme notes of the register, so trying and destructive for singers, it is useless to abuse the composer rather let us accept what is really good and striking in his style, the modified on of which may yet take place, as was the case with Rossini, Donizetti, Mercadante, Bellini, and Meyerbeer, whose early works afforded but little evidence of their brilliant after conceptions. We must, however, admit that Verdi's first operas, "Nabuco," "Lombardi," and "Ernani," are his best compositions; his "Masnadieri" was quite a failure, despite of the *prestige* of Lind and the genius of Lablache in the cast. The consumers of the present prostrated condition of art in Italy is, that the musical public are now devoted to the operas of the French and German schools, and, in due course, we hope that our English composers will have a hobby horse, now that the once exclusive infatuation for the works of the sunny south has been completely dispel ed; for art progress should have no distinction of country—a principle of which some of our rabid supporters of "native Art" are thoroughly oblivious

In no character in which Mdlle Sofie Cruvelli has yet appeared, is she seen and heard so advantageously as in *Elvira*, the part that first introduced her here in July, 1848. Her unquestionable histrionic abilities as Leonora, Queen of "Ernani" Verdi's works require singers of great physical endurance; it is of little importance whether they have mastered the correct divisions of the scale, so long as they can command a noble voice, now that the once exclusive infatuation for shakes and trills is at an end. Some Revere, who originally competed with Mdlle. Cruvelli whenever their organs came in contact. The music of *Carlos* is uncomfortably high for Coletti; but he acquitted himself artistically. Scapini has not weight enough for the part of *Silva*

On Tuesday night the usual routine of the management was again displayed, by the production of the seventh novelty, and twentieth opera of the season. The new work is Scribe and Auber's three-act opera, "Zerlina; ou, la Corbeille d'Oranges," originally brought out on the 16th of May last, at the Grand Opera House in Paris, having been expressly composed for Mdlle. Alboni, with whom were associated Mdlle. Nau, Mdlle. Dameron, MM. Aymès and Merly. It was given in the French capital with the same cast as the present pasture for London. The cast in its Italian adaptation comprises Alboni and Mdlle Nau (her first appearance at her Majesty's Theatre) in their original characters of *Zerlina* and *Fenella*; Mdlle. Crouch, in the opposite physical advantages exclusively adapted for the Verdi productions, *Ernani* suits the voice and health of Sims Reeves, who originally competed with Mdlle. Cruvelli whenever their organs came in contact. The music of *Carlos* is uncomfortably high for Coletti; but he acquitted himself artistically. Scapini has not weight enough for the part of *Silva*

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

The *Sheffield Independent* states that Mr. Roebuck, M.P., has met with a somewhat serious accident. Some days ago the hon. member was riding himself with his Newfoundland dog, and was feigning to throw a stick, when the dog, eagerly springing to seize the stick, caught hold of Mr. Roebuck's hand in his mouth, and severely lacerated the muscles of his thumb. This injury, acting upon a highly nervous temperament, produced for some days very unfavourable symptoms; but we are happy to learn that they have abated.

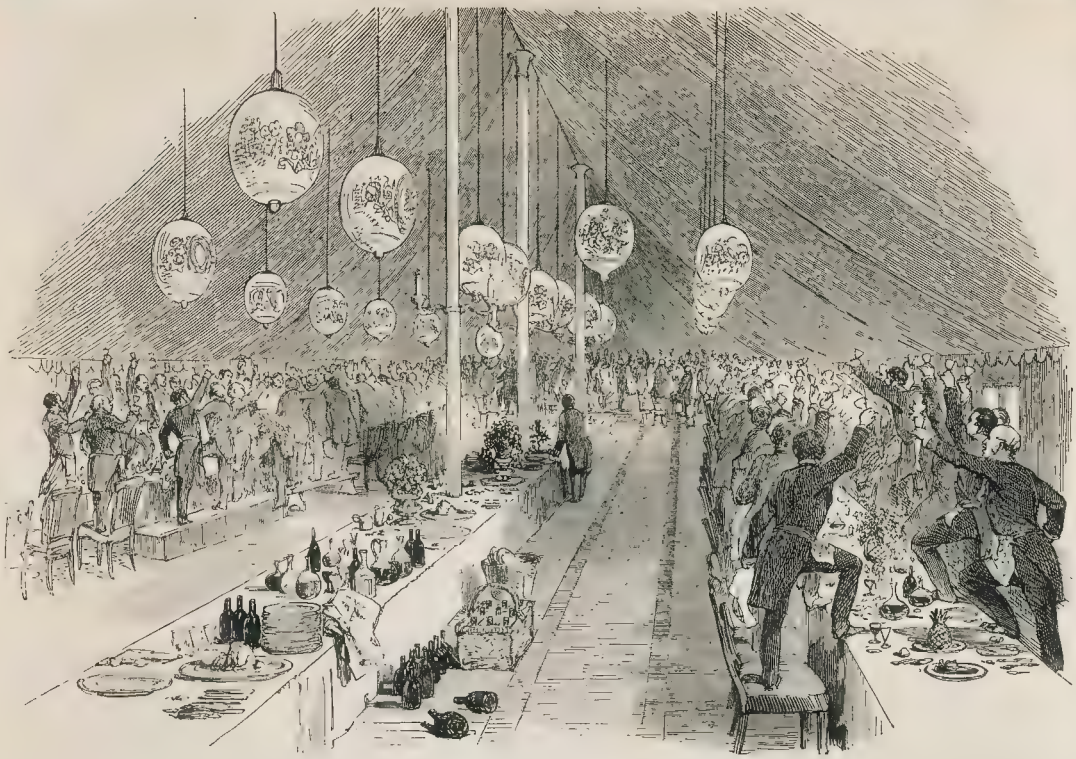
Mr. Silk Buckingham has at length succeeded in his long contest with the East India Company for indemnification for his losses as an Oriental journalist. The bill before Parliament for restitution has been withdrawn, the Court of Directors and the Government having agreed to settle upon him a pension of £400 per annum.

The Parliamentary Return publishes a complete list, alphabetically arranged, of the French persons who have sent productions to the Great Exhibition. They amount to 1696; but the *Moniteur* adds, that several of the *exposans* having united their productions under one head, the total number is about 1800. A subsequent list is to be published, divided into sections and branches of industry.

The Duke of Northumberland has kindly placed at the disposal of the officers of the 1st Royal Marine Office, cards of admission for the officers of the Marine corps and their families to view "Sion" and Northumberland House, the former on Tuesday, Wednesday, and Thursday of each week; and the latter on Thursday, Friday, and Saturday.

The annual report on the Greenwich Hospital Schools, for the year 1850, made to the Admiralty by her Majesty's Inspector of Schools, the Rev. H. Moseley, M.A., F.R.S., has been printed. It enters at considerable length into the history and organization of these schools, stating the number of pupils (which was last year 760), their attainments on admission, the course of instruction pursued, their attainments on leaving school, and the character they bore when recently in the Hospital. The report speaks very favourably of the schools and of the character of the pupils.

The Danish Ministry of War have deputed two of their officers to examine at the Royal Marine Office, cards of admission for the officers of the former on Tuesday, Wednesday, and Thursday of each week:



GRAND MASONIC BANQUET, AT RUGBY, TO GENERAL SIR CHARLES NAPIER, G.C.B.—DRINKING THE GENERAL'S HEALTH.—(SEE PRECEDING PAGE.)

fortunes may be, the recollection of this day will make me always feel that the years I devoted to the service of the British navy were the best spent part of my life." Mr. O'Byrne then thanked those gallant officers who, with the late Sir Charles Malcolm, formed a committee to recommend to the service, by the influence of their names and example, the meritorious volume. To Captain James Scott, who acted as secretary, and to Messrs. Stilwell, the treasurers, Mr. O'Byrne returned his grateful acknowledgments.

At the conclusion of his address, Mr. O'Byrne was loudly cheered, and received the hearty congratulations of his friends.

Captain W. H. Smith moved that the thanks of the meeting be given to their gallant chairman, and took that occasion to state that the "Naval Biography" was a peculiar honour to the navy, inasmuch as it was the work of a landsman. It was surprising that so much correct information should be gathered by a landsman, and not a very old one either. (Hear, hear.)

The gallant Admiral having briefly returned thanks, the meeting separated.

THE SPANISH DANCERS.—(SEE PRECEDING PAGE.)

PLATE PRESENTED TO MR. W. O'BYRNE, AUTHOR OF THE "NAVAL BIOGRAPHICAL DICTIONARY."

The testimonial is a handsome silver candelabrum, by Dobson, of Piccadilly, silversmith to the Queen. It bears the following inscription:—

Presented,
With the sum of Four Hundred Guineas, to
WILLIAM RICHARD O'BYRNE, Esq.,
Author of
"The Naval Biography,"
By more than Nine Hundred Naval Officers, who, with the First Lord of the Admiralty, have recorded their names, in token of the high estimation in which that work is held.

THE EGYPTIAN FLEET IN THE HARBOUR OF ALEXANDRIA.

THE LATE M. DAGUERRE.—FROM A DAGUERREOTYPE BY CLAUDET.—(SEE NEXT PAGE.)

THE EGYPTIAN FLEET.

Alexandria, July 6.

THE harbour of Alexandria presents just now rather a formidable appearance, for, in addition to frowning batteries, mounting several hundred guns, many of which point towards the only safe passage for large vessels through the dangerous reefs of sunken rocks which stretch across the mouth of the harbour, the Egyptian fleet, having lately undergone a refit, is seen drawn up in the centre of the anchorage, and consists of five line-of-battle ships and six frigates and corvettes, besides a few steamers. A Turkish steam-frigate, the British war-steamer *Growler*, the Peninsular steamer *Ganges*, a Tunisian brig of war, and an Austrian Lloyd's steamer, add to the interest of the scene.

We are not, however, admirers of war, and hope the Egyptian fleet may never be required to test its present capabilities; and we are quite willing to remember the bravery of Egyptian troops and sailors in Mehemet Ali's lifetime. We have much confidence in the growing sense of nations, and trust any little differences between the Porte and the present Pacha of Egypt may shortly be amicably adjusted.

The British war-steamer *Growler* arrived here some days since from Constantinople, with Sir Stratford Canning's secretary and despatches.

The Peninsular and Orienta steamer *Ganges* arrived off the bar at sun-set on the 3d, but was obliged to lay to for the night, it being too late for the Arab pilot to take the vessel past the reefs; however, she came in early next morning, the 4th, and anchored at 5.30. She had prevailing head winds during the passage out from England.

The mail-steamer *Oriental* arrived at Suez on the 2d of July, with about 80 passengers and the India and China mails.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED

DR. LINGARD.

THE Rev. John Lingard, D.D., one of the ablest historians which this or any modern country has produced, was a native of Winchester: he was born in 1769—a year of genius—the natal year of Napoleon, Sir Walter Scott, and Wellington. The University of Douay was the place of Lingard's education, and he resided there in a remarkable and troublous time, the breaking out of the first great French Revolution, and not without some danger to himself, as would appear from the following anecdote, which he was wont to narrate. On one occasion, when the disaffection of the populace had risen to such a degree that the military were under arms in the street, the young Lingard was looking out, when he observed an orderly ride rapidly up to the commanding officer, and in a few moments every trooper vaulted into his saddle. Shortly after came a counter order. The authority of the "sovereign people" was declared, and a Mons. De Baix, who had rendered himself obnoxious, was hurried, amidst yells and execrations, *à la lanterne*. The student knew this gentleman, and penetrated the crowd to inquire the cause of his summary punishment; when his dress attracting attention, he heard the cry of "Le Calote!" and presently "Le Calotean à la lanterne!" He took to his heels, darted down a narrow lane, and, thanks to his fleetness of foot, our eminent historian escaped. On another occasion he was compelled to sing the "Ca ira" with a bayonet at his breast.

After his ordination to the Roman Catholic priesthood, and previous to his appointment to Hornby, Dr. Lingard held a professorship at, and was vice-principal of, the College of St. Cuthbert, Ushaw, Durham. The rev. gentleman was an unknown and retiring priest at Newcastle-on-Tyne, when, in 1806, he gave from the local press of that town his "History of the Anglo-Saxon Church"—a work

THE LATE REV. JOHN LINGARD, D.D.

that was the first and most efficient effort to attract popular attention towards the ecclesiastical glories of our Saxon forefathers, which are now familiar objects of study and speculation. Of all books, this is the one where may be obtained the greatest insight into the national mind and ways of thought of the Christian Anglo-Saxons. This production was but the pilot sent forth to test the current of public taste: finding that an impartial and liberal-minded priest, without a compromise of any principle, could count on a cordial popularity, the author boldly conceived the design of his "History of England," of which, the first volume appeared in 1819, and, in procuring materials for which, he visited the Vatican Library with various and laborious research, and had the Stuart records in Rome open to his inspection.

On the merits of that history it is now almost superfluous to dilate. More than thirty years of unceasing popularity and unceasing sale have stamped its fame and its worth. Superior to all our other historical productions in its unerring regard to correctness of statement and reference to authority, the work of Dr. Lingard nearly equals in diction the admirable narrative style of that of his great predecessor Hume—a style vastly more suited to historical writing than the eloquence of Macaulay, or even of Edward Gibbon. Dr. Lingard is allowed by all parties to have displayed through out his book much and singular impartiality, and to have generally verified what he says in his preface in the following words:—"It has been my constant endeavour to separate myself as much as possible from every party, to stand, as it were, aloof, the unconcerned spectator of the passing events, and to record them fairly in these pages, as they came in review before my eyes. That they should always appear to others in the same light in which they appeared to me, I cannot expect; but, before the reader accuse me of prejudice, let him be assured that he is free from prejudice himself." The rest of Dr. Lingard's useful and unobtrusive career may be briefly told. The repeated new editions of his "History of England," also, an English version of the four Gospels, and various other learned publications in pamphlet form, consumed the time unoccupied by religious duty or by converse with the neighbours and friends who continually courted the charms of his society.

For the last forty years of his life, Dr. Lingard held the small and retired preferment belonging to the Roman Catholic Church in the village of Hornby, and here the historian resided, near to Hornby Castle, the seat of his attached and constant friend, Pudsey Dawson, Esq.—This may be noticed in the accompanying Sketch: it owes its first erection to Sir Edward Stanley, a hero of Flodden Field, and its recent beautiful restoration to the taste of Mr. Dawson, its present owner, who was High Sheriff of Lancashire in 1845. After a lingering illness, Dr. Lingard closed his mortal career at his house at Hornby, on the 17th inst., at the advanced age of 81. His remains, pursuant to his own

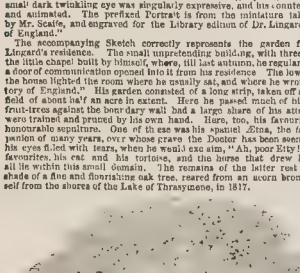
BEULAH SPA, NORWOOD.—THE BLENHEIM FREE DISPENSARY FETE.—(SEE NEXT PAGE.)

request, are to Ile at St. Cuthbert's, Uahaw. A void will be long felt in the neighbourhood of Hornby by his death.

The private virtues of Dr Lingard were as remarkable as his public talents. His whole habits of life were charmingly simple; his nature was kind, his disposition most affectionate. Many agreeable and profitable hours might be passed in his society, his mind was so richly stored, his knowledge so varied, his fund of anecdote so inexhaustible: a pleasantry and good humour pervaded his conversation at all times.

Dr. Lingard never sought controversy in any visits amongst his friends. When questioned on matters of his own faith, he would speak freely; those warmly attached to the Protestant Church or other creeds, widely differing from him in religious principles, never felt restraint in his society, or anticipated any sharpness or acrimony. In personal appearance he was rather above the middle height, and of slender frame; and though he had reached to full four-score years, his dark brown hair was but slightly tinged with gray: his small dark twinkling eye was singularly expressive, and his countenance bright and animated. The prefixed Portrait is from the miniature taken in 1849, by Mr. Scaife, and engraved for the Library edition of Dr. Lingard's "History of England."

The accompanying Sketch correctly represents the garden front of Dr. Lingard's residence. The small unpretending building, with three windows, is the little chapel built by himself, where, till last autumn, he regularly officiated: a door of communication opened into it from his residence. The lower window of the house lighted the room where he usually sat, and where he wrote the "History of England." His garden consisted of a long strip, taken off a small grass field of about half an acre in extent. Here he passed much of his time. The fruit-trees against the boundary wall had a large share of his attention; they were trained and pruned by his own hand. Here, too, his favourites received honourable sepulture. One of the ewe was his spaniel Zitna, the faithful companion of many years, over whose grave the Doctor has been seen to stand till his eyes filled with tears, when he would exclaim, "Ah, poor Etty!" His other favourites, his cat and his tortoise, and the horse that drew his carriage, all lie within this small domain. The remains of the latter rest beneath the shade of a fine and flourishing oak tree, reared from an acorn brought by himself from the shores of the Lake of Thrasymene, in 1817.



RESIDENCE OF THE LATE DR. LINGARD, AT HORNBY.

It has been reported, though on doubtful authority, that very high positions in the Roman Catholic Church were more than once offered to Dr. Lingard. There is, we believe, little or no truth in this; but those who knew his simple habits, and his love of retirement, would not be surprised at his preferring, even to the purple, his peaceful residence in the loveliest locality of the loveliest of England's northern valles. The mind that Dr. Lingard had and the very truth and purity of his nature are stamped upon his English history. An opponent Protestant historian, Mr Keightley, has pronounced that book one of the best of narratives; and there is little doubt, that, whatever may be the feeling with regard to his faith, the work of an humble Roman Catholic priest will ever hold a high rank in the standard literature of England.

Regarding Dr. Lingard's last moments, we have received the following letter, addressed to his publisher, Mr. Dolman, of New Bond-street:—

Lancaster, July 21, 1851.

SIR The late Dr. Lingard is represented in some newspaper as afraid of saying to God, because afraid to die. For many years, probably thirty or more, I have had the confidence of the above rev. historian, as his medical adviser and friend. I beg to state that he never manifested, on any occasion whatever, an unreasonable fear of any kind. He was, in my humble judgment, as wise and good a man, his mind as highly cultivated, and as thoroughly disciplined, as is attainable in this life. During the whole of the last illness he was resigned, calm, tranquil, and resigned. Not a word or gesture betrayed complaint, impatience, or fear of any kind. My religious creed differs from his and yours, and I am persuasive is unknown to you; but I know that you were esteemed by Dr. Lingard, and am sure you will take an interest in his posthumous character. You will use this note, or any part of it, with or wi hout my name, as you think proper. I remain, sir, yours very faithfully.

CHRISTOPHER JOHNSON.

M. DAGUERRE.

LOUIS JACQUES MANDE DAGUERRE, whose name is for ever associated with the Photographic process, of which he was the discoverer, died on the 10th instant, in Paris, on the sixty-second year of his age. He was a man of extreme modesty and great public usefulness, as will appear by his professional career, short of an article.

Daguerre was favourably known to the world before the announcement of his discovery of the Daguerréotype. His attempts to improve panoramic painting, and the production of dramatic effects, were crowned with the most eminent success. The following pictures attracted much attention at the times of their exhibition:—"The Midnight Mass," "Land-slip in the Valley of Goldau," "The Temple of Solomon," and the "Cathedral of Sainte Marie de Montreal." In these, the alternate effects of night and day—of storm and sunshine—were beautifully produced. To these effects of light were added others, arising from the decomposition of form, by means of which, for example, in the "Midnight Mass," figures appeared where the spectators had just beheld seats, altars, &c.; or, again, as in "The Valley of Goldau," in which rocks tumbling from the mountains replaced the prospect of a smiling valley. The methods adopted in these pictures were published at the same time with the process of the Daguerréotype, by order of the French Government, who awarded an annual pension of 10,000 francs to Daguerre and to Isidore Niepce, jun., whose father had contributed towards the discovery of the Daguerréotype

It would appear that Daguerre was led to make some experiments on the chemical changes produced in bodies, with the view of ascertaining how he could enabled to apply the curious phenomena to the production of peculiar effects in his dioramic paintings. As the question of the real part taken by Daguerre, in the process to which he has given his name, has been from time to time discussed, and sometimes to his disadvantage, it is important that the position should be correctly determined.

In 1824, Wedgwood, of Etruria, the celebrated potter, made the first recorded experiments in photography; and these, with some additional ones by Sir Humphry Davy, were published in the journals of the Royal Institution.

In 1814, Mr. Joseph Nicephore Niepce was engaged in experiments to determine the possibility of fixing the pictures in the camera obscura, which are procured and printed in Hunt's "Researches on Light;" he also sent specimens of results obtained to the Royal Society, and furnished some to the cabinets of the curious, a few of which are yet in existence. These were pictures on metallic plates covered with a fine film of resin.

In 1824 Daguerre commenced his researches, starting from that point at which Wedgwood left the research. He was also engaged in experiments on the nitrate and chloride of silver, and proceeded with his inquiry—using plates of metal and glass to receive his sensitive coatings.

In 1829 M. Vincent Chevalier brought Niepce and Daguerre together, when they entered into partnership to prosecute the subject in common

For a long time they appear to have used the [illegible] when the contrast between the resin and the polished plate was sufficient to give a good picture, endeavours were made to blacken that part of the plate from which the resin was removed in the process of *heliography* (sun-drawing), as it was most happily called. Amongst other remedies, iodine was employed, and Daguerre certainly was the first to notice the property possessed by the iodine coating of changing under the influence of the sun's rays. The following letter from Niepce to Daguerre on this subject will be read with interest:

"St. Louis par Vaxaves, June 24, 1831.

"Sir, and dear Partner,—I had long expected to hear from you with too much impatience not to receive and read, with the greatest pleasure, your letters of the 10th and 12th of last May. I shall devote myself to this process by years of the 21st, because, having been engaged ever since it reached me in your experiments on iodine, I hasten to communicate to you the results which I have obtained I had given myself much trouble to procure a plate of silver of good composition, but without hope of success, from the impossibility or nearly so, in my opinion, of fixing in any durable manner the images received on iodine, even supposing the difficulty surmounted of replacing the lights and shadows in their natural order. My results in this respect have been entirely similar to those which the oxide of silver gave me; and promptitude of operation was the sole advantage which these substances appeared to offer. Nevertheless, last year, after you left this, I subjected iodine to new trials, but by a different mode of application. I informed you of the results, and your answer, not at all encouraging, decided me to carry those experiments no further. It appears that you have since viewed the question under a less desperate aspect, and I do not hesitate to reply to the appeal which you have made. "J. N. NIEPCE."

From the above and other letters, it is evident that Niepce had used iodine, and abandoned it on account of the difficulty of reversing the lights and shadows Daguerre employed it also; and, as it appears, with far more promise of success than any obtained by M. Niepce. On the 5th of July, 1833, Niepce died; in 1837 Daguerre and Isidore Niepce, the son and heir of Nicephore Niepce, entered into a definite agreement; and in a letter written on the 1st November, 1837, to Daguerre, Isidore Niepce says, "What a difference, also, between the period when you commenced your labours and the one by which I follow! While I remain almost a whole day to make one design, you ask only four minutes! What an enormous advantage! It is so great, indeed, that no person, knowing both methods, would engage in the old one."

From this time it is certain that, although both Niepce and Daguerre used iodine, the latter alone employed it with any degree of success, and the discovery of the vapour to produce the positive image clearly belongs to Daguerre. In January, 1839 the Daguerréotype pictures were first shown to the scientific and artistic public of Paris. The sensation they created was great, and the highest hopes of its utility were entertained.

On the 15th June, M. Duchâtel, Minister of the Interior, presented a bill to the Chamber of Deputies relative to the purchase of the process of M. Daguerre, for fixing the images of the camera. A commission appointed by the Chamber, consisting of Arago, Etienne, Cari, Vatout, de Beaumont, Tourneux, Delessert (François), Comberel de Leyval, and Vitet, made their report on the 3rd of July, and a special commission was appointed by the Chamber of Peers, composed of the Baron Athalin, Besson, Gay Lussac, the Marquis de Laolace, Vicomte Sasdon, Baron Thénard, and the Comte de Ne, who reported favourably on the 30th July, 1839, and recommended unanimously that the "bill be adopted simply and without alteration."

On the 19th of August the secret was for the first time publicly announced in the Institute by M. Arago, the English patent having been completed a few days before, in open defiance of the conditions of the last enactment. M. Duchâtel to the Chamber of Deputies, who used these words, "Unfortunately for the authors of this beautiful discovery, it is impossible for them to bring their labour into the market, and thus materially increase the value of the sacrifices incurred by so many attempts so long fruitless. This invention does not admit of being secured by patent." In conclusion, the Minister of the Interior said, "You will concur in a sentiment which has already awakened universal sympathy; you will never suffer us to leave to foreign nations the glory of endowing the world of science and of art with one of the most wonderful discoveries that honour our native land."

Daguerre never did much towards the improvement of his process. The high degree of sensibility which has been attained has been due to the experiments of Fizeau, of Hippolyte Esdithuon. But this sensibility is now far exceeded by Mr. Fox Talbot, by his preparation of glass plates, which are supremely susceptible of receiving absolutely instantaneous impressions.

M. Daguerre was a member of the French Academy of Fine Arts, of the Academy of St. Luke; and many of his pictures are highly valued by his countrymen.

Our Portrait is from a Daguerréotype by Claudet, for which M. Daguerre sat in 1846.

BLENHEIM FREE DISPENSARY FETE AT THE BEULAH SPA.

YESTERDAY week (the 15th), a very interesting *fête champêtre* was given in the grounds of the Beulah spa, in aid of the funds of the Blenheim Free Dispensary and Infirmary, Blenheim-street, Oxford street, near the Pantheon. This excellent Charity has continued throughout the past year to pursue steadily its career of usefulness and good, by affording medical and surgical assistance in the hour of need to large numbers of the sick poor of the metropolis. During the above period 5464 persons were admitted patients of the institution, and received both medicines and advice suitable to their cases For admission to such benefits, a "Governor's letter" of recommendation, often difficult to obtain, is not here necessary; each case speaking for itself, and affliction being the appeal requisite, a feature in the management of the institution different from that of all other charities at the West-End of London; and shown by experience to afford the larger amount of aid to the afflicted, particularly in the numerous and urgent cases presenting themselves during epidemics, when even the delay of a few hours has often led to fatal results. No distinction of class or grade, creed or nation, is made in the Charity that the Blenheim be but in need to receive assistance and succour. With such facilities, the claims upon the institution are naturally very numerous, yet the Charity is entirely dependent for its support on voluntary contributions; and although the expenses of the last year scarcely exceeded £300, we regret to find that the institution is in debt, to aid in the discharge of which was one of the objects of the Fête at the Beulah Spa.

In this forest *pleasaunce* the gay company assembled in groups, whilst the band of the Royal Artillery played an excellent selection of pieces; and a fancy fair was held beneath the trees, presided over by a number of elegant *dejeûner* was served to 200 guests in a pavilion in the dell; the *carte* by Messrs Purssell, Cornhill; the *fête* concluded with waltzes, polkas, &c.; and the party broke up with the pleasing reflection that they had contributed to the "greatest happiness of the luxury of doing good." We should mention that Dr. Burslem, and his fellow stewards, and Mr. N. Bennett, the honorary secretary, greatly contributed by their attentions to the success of the entertainment.

CHURCH, UNIVERSITIES, &c.

PREFERMENTS AND APPOINTMENTS.—The following appointments and preferments have recently been made: *Deanery-Rural*: The Rev. J. W. S. Powell, M.A., rector of Adniger, to the rural-deanery of South-East Stoke. Diocese of Winchester—The Rev. Thomas Hawtrey Adams, M.A., to the rectory of Hinton, Kent: the Rev. J. Hughes, to Llanvihangel-Cwm Du, Brecon; the Rev. John Smith, to Brisley, with the vicarage of Gately annexed; the Rev. W. S. H. Braham, to Pe'dow, Essex. The Chapel Royal, Savoy, has received an addition for the new gentleman using the surname of Meadows, instead of that of Braham The Rev. Thomas Davidson, to St. Stephen, in Ipswich, Suffolk: the Rev. [illegible]enius, to Ewhurst, Surrey: the Rev. Edward Bargrave Deane, to Shere, Surrey: the Rev. H. A. Dixon, to St. Anne, Wandsworth, Surrey; the Rev. T. L. Mayhew, to Dalsham, Suffolk; the Rev. William Samuel Parish, to Cherry-Hinton, Cambridgeshire; the Rev. Richard Ray Haslehurst, to Alrewas, Staffordshire; the Rev. Francis Robert Maybew, to Darsham, with Bucksh, in Suffolk.

AN AGED CLERGYMAN.—By the recent death of the Rev. A. Price, M.A., the valuable rectory of Brightwell Sealme, of the county of Gloucester, and diocese of Oxford, has become vacant. In the same county, have become vacant, The rev. gentleman, at the time of his death, was within a few months of his 100th year, and was for upwards of 75 years in the Church.

TESTIMONIAL.—The following clergy have lately received testimonials of esteem and respect:—The Rev. Alan Comins, from the parishioners, on his resigning the curacy of Otterton, Devon; the Rev. William Alfred Hill, late curate of Upminster, Essex, from the parishioners; the Rev. Edward Charles Topham, Per. on his resigning the curacy of Ickwell Comes, Somerset, from the parishioners; the Rev. George Tyler, on his resigning the curacy of Bathampton, Somerset, from the parishioners; the Rev. George Napleton Prowse, from the parishioners of Bishop's Nympton, Devon.

THE LAW OF BURIAL.—Some months ago, a memorial, addressed to the Archbishops and Bishops of the provinces of Canterbury and York, upon a proposed alteration in the law of burial, was signed by a large number of clergymen of the Church of England, and the committee who were charged with the management of it have presented the archbishops and bishops. No official reply to the memorial has been given, but it is understood that the prelates have generally signified their willingness to attend to the requisition, and have expressed their approbation of its object.

PEAR SITUATIONS IN CHURCHES.—From a return printed by order of the House of Commons, it appears that there are 364,412 free sittings established in the churches built under the Church Building Act, with the aid of grants from the Church Building Commissioners, since the Act 58 George 3, c. 45.

The Rev. Henry Hayman, M.A., Fellow of St. John's College, and one of the present masters of the schools (Responsions) in the University of Oxford, has been appointed Head Master of Cheltenham College School, to succeed, next Christmas, the Rev. William Meade, M.A., lately presented to the rectory of Bisnopar, Somersetshire.

MUNIFICENT BEQUESTS.

£10,000 is left to Christ Hospital by the late John Thackeray, Esq., of the Priory, Lewisham, Kent, who for many years was a Solicitor in the Borough. He had been a governor of that institution since the year 1814, and during his lifetime had given £500 towards its funds. He has also bequeathed £2,500 for the purchase of land for the erection of such blind persons as may be admitted as "Hetherington's" Blind Fund established at Christ's Hospital; [illegible] was left to the Hospital such portion of his library as the Head Classical Master may think proper to select, and has requested of the governors the acceptance of his portrait. Bequeaths to the Female Orphan Asylum, Deaf and Dumb, Philanthropic, Asylum, Royal Asylum, Royal Asylum, and the Orphan Asylum, £300 to each; and £400 for the poor of Lewisham; and has directed that his coat of arms be cut on a tablet at the almshouses erected by him at Lewisham, with the following inscription:—"John Thackeray's almshouses for six females, built and endowed by him in the year 1840. He was a barrister-at-law in the county for many years and died —— and lies buried in his vault under the parish church." He has remembered his old and faithful servants; to some he has left a legacy of £200 or £100, and to others annuities of £20 and £10, and has left £50 for mourning to each of the six women in the almshouses. Only a few months before his death, he gave £500 to the Benevolent Society of Blues, established for the relief of the sons educated in Christ's Hospital, who may have become aged, infirm, and in reduced circumstances. Of this Society he was a vice-president. Mr. Thackeray died at Lewisham in May last, and his executors, S. W. Brown and C. A. Smith, Esqrs., proved his will a few days since, his personal property being valued at £70 000

Mrs. Maria Bowden, of Stroud-green, Croydon, has left to the London Missionary Society £100, British and Foreign Bible Society £100, and to the Surrey Missionary Society £50.

Mrs. Hannah Brandon, of Westmoreland-place, has bequeathed to the Spanish and Portuguese Jews' Synagogue, Bevis Marks, £25; Spanish and Portuguese Jews' Hospital, called "Beth Hollim," in Mile-end-road, £15; and to the Spanish and Portuguese Jews' Charity School, called "Sharre Tikva," £10.

THE GREAT EXHIBITION.

THE proceedings of the past week have not been characterised by any remarkable deviation from the now settled routine of visitation and examination. The numbers present a much higher average than we calculated upon some time ago; and it seems probable that the "shilling" days will count 70,000 as the general number of visitors. To all appearance, as the period at which the Exhibition is now intended to be closed the middle of October—draws nigh the numbers seem likely to increase in a ratio equivalent to the shortness of the time available for the examination. One incident of the week deserves a special mention: on Wednesday, 150 persons in the employment of the Duke of Northumberland came from Alnwick to witness the spectacle.

Her Majesty's last visit (for some time) was announced in our last, was characterised by a pleasing manifestation on the part of those present, and was, under the circumstances, was excusable. On nearly all occasions when the Queen has attended for a time after the admission of the people, there has been a strict adherence to that good taste, which, whilst acknowledging her presence by that excusable curiosity which urged every one to seek to see her, yet always contained an outward manifestation of satisfaction from breaking forth in any noisy bond. On Saturday, however, but on Friday, when the Queen departed, after a lengthy visit, the hearty cheers which broke forth beyond the good wishes of Loose whose gratification had been so largely enhanced by her [illegible]

Another visit of the Royal Family to the Exhibition in the museum of Sa[illegible] on Walden has enabled a better arrangement to be made of the magnificent present of the Nawab Nazim; and the howdah with a [illegible] has been so united upon the back of the [illegible] elephant as successfully carried out in the arrangements on the British side. This is so important a question, that we cannot do better than quote from the document now in course of circulation to one section of exhibitors as a commencement.

The Executive Committee state that—

"Any successful realisation of the proposed plan must depend upon the co-operation of the exhibitors, and their appreciation of its uses. A merchant, importer, or manufacturer will easily understand the advantage which he would derive from the existence of a systematic collection, always accessible, of specimens of any given kind of raw materials or manufactures, when he could occasionally consult them. It may, therefore, be expected that the interest of each exhibitor will induce him to aid in forming the proposed collection, by presenting, as far as practicable, specimens of the materials or fabrics which he is exhibiting. Every exhibitor hitherto consulted on this subject has cordially welcomed the proposal, and has promised every assistance in carrying it into effect, by freely contributing both actual specimens, and every information concerning them which may be desired

"In forming the collection, different kinds of treatment will have to be adopted towards the various classes of articles In respect of the department of Raw Materials, constituting the four first classes of the Exhibition, it will be desirable to collect specimens of the actual articles themselves, and exhibitors will be requested to place small duplicate specimens at the disposal of the Commissioners. But this principle, for reasons of space, &c., will not apply as a general rule to machinery, and articles of colossal bulk, such as most manufactures, furniture, pottery, sculpture, &c. It is proposed to obtain a record of these, with the parm ssion of the exhibitors, where it may be desirable to have it, by means either of accurate drawings or Talbotypes. Those cases where the representation of the article is preferred to the article itself, will be hereafter pointed out. As respects the remaining classes of the Exhibition, such as all kinds of woven fabrics, in cotton, wool, flax, silk, &c., all printed and laid fabrics, paperhangings, leathers, &c., it is proposed to collect duplicate specimens of the articles themselves."

Every [illegible] promise[illegible] of the Great Exhibition will cordially co-operate in carrying out these views.

Another incident of the past week requires a record. The long pending arbitration between the Commissioners and Messrs. Munday, in consequence of the contract between those gentlemen and the Society of Arts having been avoided by the Royal Commission, having been placed in the hands of Mr. H. Henderson, the architect, that gentleman, acting as sole arbitrator, has awarded £4150, with the expenses, as a full payment for loss, injury, or disappointment, to Messrs. Munday, for the non-fulfilment of the contract, which certainly cannot be considered as a favourable result of the Exhibition to people with more confidence than they otherwise could have done at the period at which it was made, and, in all probability, did much to promote the future success of the movement. The terms of the award are to be paid at the same time. Sunday is [illegible] and we think few persons will be inclined to think it are overpaid on the one hand, or not sufficiently remunerated on the other.

We understand that Mr. Cockerell, one of the Royal Commissioners, has charged Mr. A. Munro to execute for him, in marble, a group of "Paolo and Francesca," engraved at page 32 of our Journal for July 5.

ARTICLES LOST AT THE CRYSTAL PALACE.—The following is a return of things found in the Crystal Palace, which were delivered over to the custody of the police between the 1st of May and the 1st of this month, and were at that last date still unclaimed by their owners:—271 handkerchiefs, 65 bracelets, 31 purses, 27 shawls, 24 veils and scarfs, 23 bonnets, 3 babies, 14 shawls and 7 cotton umbrellas, 46 veils and falls, 2 shirt studs, 57 catalogues and other books, 35 brushes of keys, 44 neck ties, 1 pair of galoshes, 8 sockets, 3 camperoils, 10 vests, 1 pair of boots, 2 pairs of gaiters, 1 gentleman's cape, 3 scarf pins, 3 card cases, 11 brooch and other chains, 3 knives, 3 pincushions, 2d pair of gloves, 26 walking sticks, 10 pair of spectacles, 12 opera glasses, 16 pencil-cases, 3 umbrella cases, 3 rings, 1 pair of braces, 1 silver watch, 1 gold watch, 1 [illegible] watch, 1 child's reticules and baskets, 14 shawls, 2 boxes, 1 petticoat, 2 carpenter's [illegible] 1 satin d'dollar note, 3 scent-bottles, 1 purse 6d., 1 ditto 2s. 7d., 1 ditto 5s., 1 ditto 1s. 6d., 1 ditto 6d., 1 ditto 1d., 1 ditto 6s. 3d., 3 empty [illegible] cash found £2 10s. 6d.

Lord Stanley left town on Tuesday morning for India, where his Lordship will remain until the approach of the next session of Parliament

RAILWAYS IN IRELAND.—The following important communication has been addressed to the Earl of Enniskillen by Lord John Russell, in reply to a statement recently submitted to him by a numerous body of Peers and Members of the House of Commons interested in the Island of Ireland, on the subject of completing and amalgamating the railway system in the north of Ireland:

Downing-street, 17th July, 1851.—My Lord, Her Majesty's Government have considered the application which has been made to them by you and many of your Lordship's friends and others connected with the north-east of Ulster, relative to the establishment, as part of the United Kingdom. Her Majesty's Government are fully sensible of the [illegible] from the extension of railways in Ireland, and are desirous to promote such an extension, and of the peculiar advantages to be expected from connecting the [illegible] of Belfast with the railways of the south and west. But the pecuniary circumstances of the [illegible] not, however, conceive themselves warranted in supporting any scheme [illegible] from the Treasury, or to [illegible] the Government will be disposed to [illegible] them, that a scheme, similar to the one which is recommended in the [illegible] in which the Government [illegible] or in the province [illegible] her Majesty's Government will be disposed to lend their assistance in obtaining legislative authority for establishing such a [illegible] Government, and the principle of the Irish Railway System, that the means of local [illegible] should be responsible, and should guarantee some [illegible] per dollar rate as will indemnify the Government from any loss which may arise from the [illegible] Such a measure [illegible] by no means [illegible] effect upon a decided opinion on the part of [illegible] of Ireland, that the railway system ought to be made the subject of [illegible] and improvement for the railway by which they may be [illegible] It appears also essential that a [illegible] should be made to ascertain the views and wishes of the [illegible] of the [illegible] of the proposed railways should, together with any other existing [illegible], be [illegible] by the Government. I have the honour to be, my Lord, your Lordship's most obedient servant, J. RUSSELL. The Earl of Enniskillen.

CHURCH EXTENSION.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels [illegible] has recently had its annual meeting for the election of [illegible] on the subject of church extension. There were also present the Bishop of Salisbury and Oxford, the Rev. Sir C. Farnaby, Bart; the Reverends Dr. Wordsworth, Robert Bruce, H. Howarth, Alfred Ollivant, Dr. Hook, A. J. B. Hope, A. C. C. Lewis, Edward Hawtrey, James Cooke, H. J. Barchard, and Arthur Powell. Thirty-[illegible] and have been erected since the last meeting, [illegible] [illegible] Grants of money have been made for the following objects:—The building of nine new churches; viz. at Barkisland, in the chapelry of Ripponden, and parish of Halifax; Palmer's Village, or St. Mark's district, in [illegible] parish of Bilston, Staffordshire; at Sedgley, and parish of Sedgley Gorsedd, a district in the parish of Wednesbury, Staffordshire; at Hunslet, Yorkshire; Cowpen, in the chapelry of Horton, and parish of [illegible] Northumberland; Shipley, a district in the parish of Shipton, Yorkshire; Tipton, a district in the parishes of St. Mary, Southampton, and South Stoneham; and St. Michael's district, or sono-hill, in the parishes of Handsworth, Staffordshire. Grants of money have been made for the following objects:—The building of nine new churches; viz. at Barkisland, in the chapelry of Ripponden, and parish of Halifax; Palmer's Village, or St. Mark's district, in [illegible] parish of Bilston, Staffordshire; at Sedgley, and parish of Sedgley Gorsedd, a district in the parish of Wednesbury, Staffordshire; at Hunslet, Yorkshire; Cowpen, in the chapelry of Horton, and parish of [illegible] Northumberland; Shipley, a district in the parish of Shipton, Yorkshire; Tipton, a district in the parishes of St. Mary, Southampton, and South Stoneham; and St. Michael's district, or sono-hill, in the parishes of Handsworth, Staffordshire. Grants of money have been made for the following objects:—The building of nine new churches; viz. at Barkisland, in the chapelry of Ripponden, and parish of Halifax; Palmer's Village, or St. Mark's district, in [illegible] parish of Bilston, Staffordshire; at Sedgley, and parish of Sedgley Gorsedd, a district in the parish of Wednesbury, Staffordshire; at Hunslet, Yorkshire; Cowpen, in the chapelry of Horton, and parish of [illegible] Northumberland; Shipley, a district in the parish of Shipton, Yorkshire; Tipton, a district in the parishes of St. Mary, Southampton, and South Stoneham; and St. Michael's district, or sono-hill, in the parishes of Handsworth, Staffordshire. Grants of money have been made for the following objects:—The building of nine new churches; viz. at Barkisland, in the chapelry of Ripponden, and parish of Halifax; Palmer's Village, or St. Mark's district, in [illegible] parish of Bilston, Staffordshire; at Sedgley, and parish of Sedgley Gorsedd, a district in the parish of Wednesbury, Staffordshire; at Hunslet, Yorkshire; Cowpen, in the chapelry of Horton, and parish of [illegible] Northumberland; Shipley, a district in the parish of Shipton, Yorkshire; Tipton, a district in the parishes of St. Mary, Southampton, and South Stoneham; and St. Michael's district, or sono-hill, in the parishes of Handsworth, Staffordshire.

On Monday a party of female emigrants, thirty-six in number, being the eighteenth consignment under the auspices of the Female Emigration Society, left London by the Blackwall Railway, to embark on board the *Northumberland*, lying off Gravesend. Their destination is Port Phillip, to which colony two other parties have been despatched, of whom very favourable accounts have been received. The applications latterly for the means to embark have considerably decreased—a result owing, it is said, to the generally increased facilities of obtaining employment and the payment of better wages.

Lord Dunsandle will succeed to the vacancy in the representative peerage of Ireland, caused by the decease of that most upright and consistent politician the late Earl of Charleville.

COUNTRY NEWS.

REPRESENTATION OF LIMERICK.—Lord Arundel and Surrey has accepted the invitation of the Limerick electors to represent their borough. In his address he refers them to his fourteen years of public life for his political principles, as they say:—"In the name of Limerick has been long distinguished, in the annals of Ireland, for her sufferings and exertions in the cause of religious freedom. To represent such a city, at such a time as the present, will necessarily demand all the efforts and all the powers of which I am possessed. I trust the day will come when the blessings of religious rights will be permitted throughout the United Kingdom; when religious obedience will be no longer branded as inconsistent with the duty of a patriot; and every portion of her Majesty's subjects will come to the full enjoyment of serving God according to their conscientious convictions, undisturbed by the officious interference of the state in their system of church government. But while the struggle lasts, I should consider myself a deserter if I did not accept an honourable opportunity of incurring my share of duty and of labour. Waiving, therefore my own wishes, which would induce me at present to remain out of Parliament, I respond with sincere gratitude to the call which you have made upon me."

SCARBOROUGH ELECTION.—Mr. G. F. Young, the Protectionist candidate, was returned M.P. for this borough, by a majority of 33 over his rival, Lord Ingram, Ministerialist. The numbers were—Young, 314; Mulgrave, 281: majority, 33.

The importation of foreign grain, cheese, &c., into Liverpool for the fortnight ending 16th July, 1851, amounted to 136,303 bushels wheat, 244 sacks ditto, 11,761 sacks flour, 18,837 barrels ditto, 214,398 bushels Indian corn, 6319 bags ditto, 12,950 bushels barley, 9160 bushels oats, 138 sacks ditto, 2700 bushels rye, 47 240 bushels beans, 10,280 bushels peas, 150 bags ditto, 1653 bushels beans, 150 sacks ditto.

RAILWAY COMPETITION.—The Midland and Great Northern Railway Companies are struggling in a most extraordinary manner for the Exhibition traffic from Leeds and the neighbouring locality. On Tuesday, the third-class fare from Leeds to London and back were only 4s. 6d. by the Great Northern, and 5s. by the Midland, with a prospect of a still further reduction, each company having announced the determination to be 6d. lower than its competitor.

A NUMBER OF POLES engaged in the Hungarian revolution, and who have recently arrived in this country from Turkey, left Southampton for Havre on Tuesday night. The expense to the English Government of those Hungarians and Poles who have been recently released from captivity in Turkey, through the interference of Sir Stratford Canning, is about £2000. This expense has been incurred in conveying the unfortunate exiles across this country and in shipping them to America. Many of the refugee officers have not been under the necessity of receiving assistance from the British Government. Two more batches of Hungarian refugees are shortly expected from Constantinople. Amongst the last party will probably be Kossuth and his family.

LAMENTABLE OCCURRENCE.—A very shocking and fatal accident occurred at Cooley, Lancashire, on Monday, Mr. Henry Cunliffe Shawe, a young gentleman, 19 years of age, who had recently come into possession of Gibbrand Hall estate, and other large property, by the death of his father, was at Cheadle on a visit, in company with his friend, Mr. Tompson, son of Admiral Sir Andrew F. Green, and on Monday they were invited to descend a coal mine, in which there was a good deal of foul air, to look at the works. The colliery was that of Mr. Jonathan Bennett and Sons. Before they could get them, the under'ooker of the works (Mr. Billinge) and a sinker, named William Taylor, descended the shaft, 208 yards deep, and they took with them a blazing tar-rope to give light. Shortly after their descent a boy at the mouth of the pit observed a rush of air up the shaft, as if an explosion had taken place, and gave an alarm. The son of Mr. Bennett and others went down in search of the parties (after shouting down the shaft without getting an answer), but the air was so foul that it was impossible before they could venture to the bottom. The result was, as may be surmised, that the whole of the party, four in number, had perished, having no one to tell the melancholy circumstances immediately leading to their death. The bodies of Mr. Shawe and Mr. Billinge, with their companions were recovered about midnight; and there is no doubt, from their scorched and disfigured state, that they had ignited the carburetted hydrogen gas so fatal in coal-mines, and that they had fallen a sacrifice to the fire which had dictated the use of an unprotected light in place of a Davy lamp.

TAKING THE VEIL.—On Wednesday, last week, eight young women made their "profession" in Glasgow, by resigning the white veil of the postulant, and assuming the black veil of the nun. The ceremony took place in St. Andrew's Catholic chapel, Great Clyde-street, and is described as having been one of a highly imposing character—the Catholic clergy from nearly every part of the western district having been present. The young ladies were Miss March and Miss Condon, Miss Fitzpatrick, Miss Robertson, Miss B. A. Mackintosh, Misses Hannah and Mary O'Swalney, and Miss Barry.

THUNDER-STORM.—On Friday evening last week, the town of Sunderland was visited by a destructive thunderstorm. From a vessel lying in the roads, a large bull of fire, of a blue colour tinged with red, appeared to descend and fall upon the lower part of the town. This ceremony took place to the accompaniment of a tremendous peal of thunder, re-sembling a salvo of artillery. The sky for several moments was completely illuminated with sheet lightning, which was followed immediately by a heavy shower of rain. The electric fluid struck the chimney of a house in Sea-street, which was shattered to pieces, and the bricks strewn in all directions, and breaking in the roof. A boy named Bally was struck with lightning. He was taken up in a state of insensibility, and stayed the same evening at nine o'clock. In a neighbouring house in the same street, as Mrs. Woodcock, a married woman, was sitting sewing her husband's clothes in an upper room, the electric fluid struck the needle and thimble on her finger, and she received a pungent shock, and was thrown down on the floor, and when taken up she was found to have completely lost her speech and hearing. She was immediately attended by Mr. Dickson, surgeon, and remedies were applied. The apparatus for the gas was brought, and a gentle current of the electric fluid was passed through her frame for about a quarter of an hour, when she again received her speech and hearing, and, although extremely weak, is now in a fair way of recovery. The sounds resulting the street was crowded by a great mass of people, and the greatest excitement prevailed. It is violent storm was of short duration, and about two hours afterwards the sky became calm and serene.

THE LIVERPOOL MAGISTRACY AND THE ORANGE PROCESSION.—A meeting of the magistrates was held on Friday, last week, to take into consideration a letter from Sir George Grey, relative to the late procession, and the distur ances consequent thereon. On the 5th instant, Sir George transmitted to the mayor a memorial sent from an individual in Liverpool to the Secretary of State for the Home Department, stating that, to make the procession formidable and effective, the Liverpool Orange lodges must be struck out to it from Ireland and the different towns in Lancashire; that they had been supplied with abundant money by certain partisans for the purchase of new and showy flags; and that, in anticipation of opposition, they had never died members with new and fire-arms. This communication was handed to Mr. Dowling, the head constable, who, it is said, doubted the statements that it contained, and did not apprehend any disturbance. An investigation, however, was subsequently held, and on a vote being taken whether any measures should be adopted to prevent the procession, six voted for and nine against any measure being taken. The procession took place, and the disturbances were mischievous, as was anticipated from the extraordinary increase in the traffic returns. Closing figures are—

ORDINARY SHARES AND STOCKS.—Aberdeen, 9¾; Caledonian, 9¾; Chester and Holyhead, 18½; Eastern Counties, 6¾; East Lancashire, 12¾. Great Northern, 16¾; Ditto, Haives, B. 13½; Great Western, 83½; 14¼; Lancashire and Yorkshire, 47¼; Ditto, Fifths, 9¾; London and Black-wall, 6¾; London, Brighton, and South Coast, 94; London and North-Western, 122¾; London and North-Western, Quarter Shares, 29¾; London and South-Western, 74¼; Manchester, Sheffield, and Lincolnshire, 26¾; Ditto, Manchester and Lincoln Union, 1; Midland, 38¼; Ditto, £50, 13; Newmarket 7¾; North British, 6¾; North Staffordshire, 7¾; South Eastern, 21¼; York, Newcastle, and Berwick, 18, ; York and North Midland, 18.

LINES LEASED AT FIXED RENTALS.—Birmingham and Oxford Junction, with guarantee, 29 ex int; Buckinghamshire, 17¾ ex int; East Lincolnshire, 23¾; Hull and Selby, 103; Ditto, Quarters, 78; London and Greenwich, 11¾; Northern and Eastern, 64; South Staffordshire, 6¾; Wear Valley (£25 paid), 25. Wilts, Somerset, and Weymouth, 4¾ ex int.

FOREIGN.—East Indian (£16 paid), 18¾ ex int; Northern of France, 14¾ ex int; Orleans and Bordeaux, 4¾ ex int.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The Consol Market has been rather firmer for the last few days, a rise of ⅛ per cent on Tuesday having been since maintained. Monday's opening price was 96¾ ⅞, for Money, improving on Tuesday to 96⅞ ⅞, and remaining at the same quotation until the close of the week's business. Exchequer Bills have fluctuated but little, and are 53 and 54 to 53 premium. India Bonds present a steady price. The week has been unmarked by any occurrence affecting the Stock Market, but the value of money is a shade higher. At the close of the week prices were, for Bank Stock, 215¾; Consols, 96⅞; New 3½ per Cent Annuities, 98⅞; Long Annuities, to expire January, 1860, 7⅞; India Stock, 263; India Bonds, £1000, 61 pm; India Bonds, under £1000, 59 pm. South Sea Stock, 107¾; Consols for Account, 96⅞. India Stock or Account, 263; Exchequer Bills, £1000, 49 pm; Ditto, Small, 52 pm.

The Foreign Market has been heavy during the week. Mexican ranging on Monday from 30 to 2, improving on Tuesday, in consequence of purchases, to 30⅜ ⅝. The latter quotation has been since improved to 30⅝. Sardinian Scrip is still out of favour, having ranged from ⅜ to 1½ dis. Spanish 5 per Cents range lower, in consequence of the price coming lower from Madrid. Business, however, during the week has been very limited, and the close was marked by dulness, and a tendency to lower prices. Quotations are—Brazilian Bonds, Five per Cent., 91; Chilian Bonds, Six per Cent., 104½; Grenada Bonds, Three-and-a-Half per Cent., 18½; Mexican, Five per Cent., Av. Lon. Coups., 30⅜ ex d.; Portuguese, Five per Cents., 87½; Ditto, Four per Cent., 34½; Russian Bonds, Four-and-a-Half per Cent., Small, 100½; Sardinian Bonds, Five per Cent., Sept., 1½ dis.; Spanish, Five per Cent., 1840, Account, 19½; Ditto, Passive, 5⅛; Ditto, Three per Cent., Account, 39½; Venezuela Bonds, Two-and-a-Quarter per Cent., 31½; Belgian, Five per Cent., 102; Dutch, Four per Cent., Certificates, 97.

The Share Market has been firmer, and some *bond fide* purchases assisted in reaching a slight decree of animation. Notwithstanding, great caution is exercised with reference to any business of extent, and the failure of two firms at Liverpool has revived the apprehensions of a fresh foundation of Stock from that quarter. Consequently, at the close of busi ess, the Mar ket although steady, did not show such an upward tendency as might have been anticipated from the extraordinary increase in the traffic returns. Closing figures are—

ORDINARY SHARES AND STOCKS.—Aberdeen, 9⅝; Caledonian, 9⅝; Chester and Holyhead, 18½; Eastern Counties, 6¾; East Lancashire, 12¾. Great Northern, 16¾; Ditto, Haives, B. 13½; Great Western, 83½; 14¼; Lancashire and Yorkshire, 47¼; Ditto, Fifths, 9⅝; London and Black-wall, 6⅝; London, Brighton, and South Coast, 94; London and North-Western, 122⅝; London and North-Western, Quarter Shares, 29⅝; London and South-Western, 74¼; Manchester, Sheffield, and Lincolnshire, 26⅝; Ditto, Manchester and Lincoln Union, 1; Midland, 38¼; Ditto, £50, 13; Newmarket 7⅛; North British, 6¾; North Staffordshire, 7⅝; South Eastern, 21¼; York, Newcastle, and Berwick, 18, ; York and North Midland, 18.

LINES LEASED AT FIXED RENTALS.—Birmingham and Oxford Junction, with guarantee, 29 ex int; Buckinghamshire, 17¾ ex int; East Lincolnshire, 23¾; Hull and Selby, 103; Ditto, Quarters, 78; London and Greenwich, 11¾; Northern and Eastern, 64; South Staffordshire, 6¾; Wear Valley (£25 paid), 25. Wilts, Somerset, and Weymouth, 4¾ ex int.

PREFERENCE SHARES.—Eastern Counties Extension, No. 2, par; Great Northern, 13⅞; London and South Western, (New, 7⅜; Manchester, Sheffield, and Lincolnshire, £6, 3¾; North British, 4¾; Oxford, Worcester, and Wolverhampton, 4⅝.

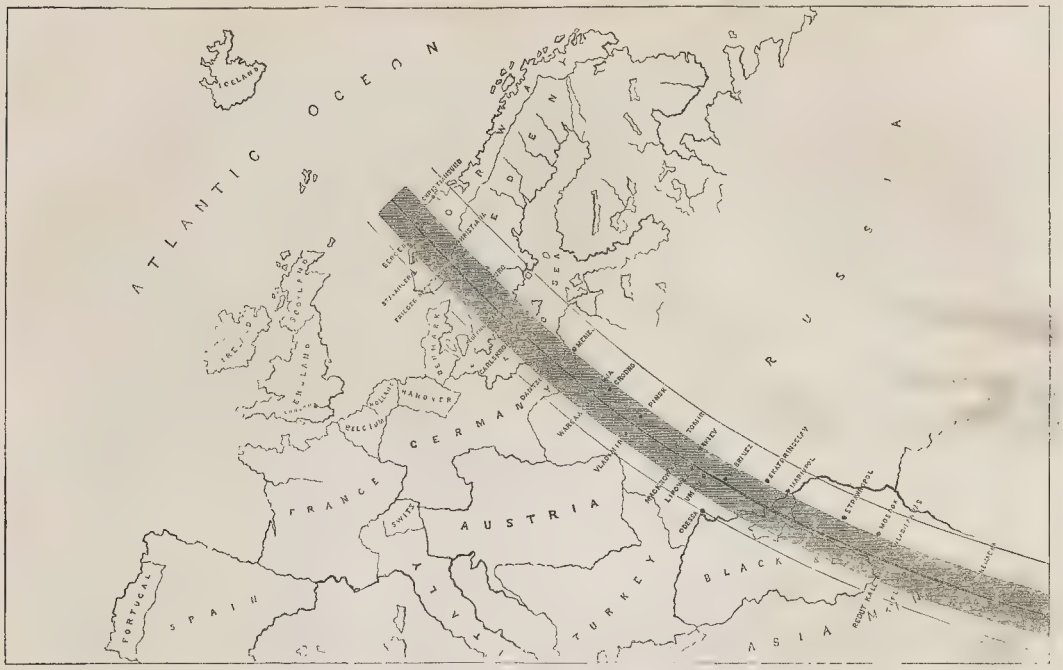
FOREIGN.—East Indian (£16 paid), 18¾ ex int; Northern of France, 14¾ ex int; Orleans and Bordeaux, 4⅝ ex int.

THE MARKETS.

CORN EXCHANGE.—Very limited supplies of English wheat have arrived as to our market this week, coastwise, as well as by land carriage and sample. On the whole the demand has ruled steady, and good runnings have been offered, at full prices. The foreign wheats have changed hands somewhat freely, at fully previous rates, but low and middling qualities have been unusually dull. Barley in demand, at previous currency and prices have been generally secured. No English barley has appeared at market; and the receipts from abroad have fallen off. Grinding parcels have realised full currencies; but malting and distilling sorts have been comparatively dull sale. No change to notice; but oats have been in fair demand, and the quotations have had an upward tendency. Beans, peas, and Indian corn—the latter afloat—have ruled somewhat very little attention. In flour—both English and foreign—rather an extensive business has been transacted at full prices.

English.—Wheat, Essex and Kent, red, 76s to 84s; ditto, white, 87s to 96s; Norfolk and Suffolk, red, 76s to 82s; ditto, white, 87s to 94s; rye, 52s to 57s; grinding barley, 31s to 35s; distilling ditto, 36s to 38s; malting ditto, 39s to 42s; Kingston and Ware, 40s to 44s; Chevalier, 44s to 46s; Peterborough and Yorkshire ditto, 44s to 46s; Kingston and Ware, 50s to 54s; harvest, 34s to 36s; Yorkshire and Lincolnshire feed oats, 19s to 22s; potato ditto, 22s to 24s; Angus, 24s to 25s; ditto, Scotch, 24s to 25s; ditto, Irish, 22s to 24s; tick beans, new, 36s to 38s; old, 40s to 42s; Lincoln and Essex, new, 37s to 39s; old, 40s to 42s; Harlestone green, new, 37s to 39s; old, 40s to 42s; grey peas, new, 36s to 38s; maple, 38s to 40s; white, 40s to 42s; Egyptian flour, 27s to 31s per quarter. Town-made flour, 33s to 36s per sack. Suffolk, 29s to 31s. Stockton and Yorkshire, 27s to 31s per sack.

Foreign.—Wheat, Marks, 40s to 42s per quarter. Odessa, 40s to 42s; Taganrog, 40s to 42s; Egyptian, 38s to 40s; Salonica, 40s to 42s; Marianopoli, 40s to 42s; Polish Odessa, 40s to 42s; Brabant, 40s to 42s; Ghent, 40s to 42s; Ostend, 40s to 42s; Petersburg, 40s to 42s; Riga, 40s to 42s; Archangel, 40s to 42s; Memel, 40s to 42s; Danzig, 40s to 42s; Stettin, 40s to 42s; Pomeranian, 40s to 42s; Rostock, 40s to 42s; Mecklenburg, 40s to 42s; Holstein, 40s to 42s; Lubeck, 40s to 42s; Bremen, 40s to 42s; Hanover, 40s to 42s; Oldenburg, 40s to 42s; Holland, 40s to 42s; Belgian, 40s to 42s; Flanders, 40s to 42s; French, 40s to 42s; Bordeaux, 40s to 42s; Nantz, 40s to 42s; Rouen, 40s to 42s; Marseilles, 40s to 42s; Trieste, 40s to 42s; Venice, 40s to 42s; Leghorn, 40s to 42s; Genoa, 40s to 42s; Naples, 40s to 42s; Sicily, 40s to 42s; Barbary, 40s to 42s; Egyptian, 40s to 42



MAP OF EUROPE, SHOWING THE COURSE OF THE SHADOW IN THE TOTAL ECLIPSE OF THE SUN, JULY 28, 1851.

the cusps of the Sun were about 40° asunder, a row of lucid points, like a string of bright beads, irregular in size and distance from each other, *suddenly* formed round that part of the circumference of the Moon that was about to enter, or which might be considered as having just entered, on the Sun's disc. Its formation, indeed, was so rapid, that it presented the appearance of having been caused by the ignition of a fine train of gunpowder. (See Fig. 1.) My surprise, however, was great on finding that these luminous parts, as well as the dark intervening spaces, increased in magnitude, some of the contiguous ones appearing to run into each other like drops of water; for, the rapidity of the change was so great, and the singularity of the appearance so fascinating and attractive, that then and for the moment distracted, and lost in the contemplation of the scene. (See Fig. 2.) Finally, as the Moon pursued her course, these dark intervening spaces were stretched out into long, black, thick, parallel lines (See Fig. 3.) Fig. 4 represents a continuation of the same phenomenon; when, all at once, the long threads *suddenly* broke and wholly disappeared, leaving the circumferences of the Sun and Moon in those points, as in the rest, comparatively smooth and circular; and the Moon perceptibly advanced on the face of the Sun. After the formation of the annulus thus described, the Moon preserved its usual circular outline during its progress across the Sun's disc, till its opposite limb again approached the border of the Sun, and the annulus was about to be dissolved; when (all at once), the limb of the Moon being at some distance from the edge of the Sun, a number of long, black, thick parallel lines, exactly similar in appearance to the former ones above mentioned, *suddenly darted forward* from the Moon and joined the two limbs as before, and the same phenomena were thus repeated, but in an inverse order."

On July 8th, 1842, a total Eclipse of the Sun took place, and Mr. Bally went to Pavia, in Italy, to observe it. In an account of the phenomenon from him to the Royal Astronomical Society, Mr. Bally remarks: "I at first looked out very narrowly for the *black lines* which were seen in the annular eclipse of 1836, as they would probably precede the string of beads. These lines, however, did not make their appearance; or, at least, they were not seen by me. But the *beads* were distinctly visible, and on their first appearance I had noted down on paper the time of my chronometer, and was in the act of counting the seconds in order to ascertain the time of their duration, when I was astounded by a tremendous burst of applause from the streets below, and at the *same moment* was electrified at the sight of one of the most brilliant and splendid phenomena that can well be imagined: for, at that instant, the dark body of the Moon was *suddenly* surrounded with a *corona*, or kind of bright *glory*, similar in shape and magnitude to that which painters draw round the heads of saints, and which by the French is designated an *auréole*.

"Pavia contains many thousand inhabitants, the major part of whom were, at this early hour, walking about the streets and squares, or looking out of windows, in order to witness this long talked of phenomenon; and when the total obscuration took place, which was *instantaneous*, there was a universal shout from every observer, which 'made the welkin ring,' and for the moment drew my attention from the object with which I was immediately occupied. (See Figure.) I had indeed anticipated the appearance of a luminous circle round the Moon during the time of total obscurity; but I did not expect, from any of the accounts of preceding eclipses that I had read, to witness so magnificent an exhibition as that which took place." Mr. Bally then proceeds to say that the most remarkable circumstance attending this phenomenon, was the appearance of three large protuberances, apparently emanating from the circumference of the Moon (see Figure); and he remarks that his attention was so constantly taken up by the remarkable and unexpected appearances, that he omitted to watch for the re-appearance of the beads, and, therefore, he could not add his testimony to the recurrance of that phenomenon.

MARRIAGE OF LORD EDWARD FITZALAN HOWARD AND MISS TALBOT.—THE BRIDAL CAKE.

APPEARANCE OF THE SUN AT THE ANNULAR ECLIPSE OF 1836, MAY 15, AS SEEN BY MR. F. BAILY.

APPEARANCE OF THE SUN A SHORT TIME BEFORE TOTALITY.

APPEARANCE OF THE SUN AND MOON ONE OR TWO SECONDS OF TIME BEFORE TOTALITY.

At London. At Edinburgh.

The Astronomer Royal, G. B. Airy, Esq., made a journey to Turin for the purpose of observing the Eclipse; and in his account of the phenomena, to the Royal Astronomical Society, he remarks that he saw nothing whatever of beads or other irregularity in either of the extremities of the Sun's limb. But the appearance of the Moon can never be forgotten—it was like a black patch fixed in the sky, surrounded by a ring of faint light, whose breadth he estimated at 1-8th of the Moon's diameter. He then says, "I gazed earnestly at this remarkable ring, and I could not divest myself of the idea that it was produced by the sun's light shining past the Moon's body through a portion of our own atmosphere. I wish it to be understood clearly that I do not offer this as an explanation of the ring (indeed, considering the number of miles by which the Moon's limb overpassed the line drawn from the place of observation to the Sun's limb, I cannot now consider such an explanation tenable)." After a few other remarks on the ring, he proceeds. "I took off the dark glasses and carefully examined the Moon with the telescope. Her disc was distinctly visible as having independent light; and I think that if it had been stronger I might have seen the 1 rge tracts of different brightness on her disc. I could not, however, see the smallest inequality of light of the nature of broad dark tracts, or dark spot, or bright spot. While thus looking at the Moon, I saw, to my great surprise, some small red flames at the apparent bottom of the disc (the top as seen with the naked eye). The number of flames, as I have them impressed on my memory, and as I find them drawn on a small pencil sketch made a few minutes after their appearance, was three; their form was nearly that of saw-teeth, in the position proper for a circular saw turned round in the same direction as the hands of a watch turn." (See the fifteenth vol. of the *Memoirs of the Royal Astronomical Society*.) The preceding are copies of the drawings made by the Astronomer Royal.

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS

No. 505.—VOL. XIX.] SATURDAY, JULY 26, 1851. [TWO NUMBERS, 1s.

THE GREAT EXHIBITION.

THE ZOLLVEREIN.

Our readers are probably aware that the Zollverein (toll-union), which occupies a large part of the Crystal Palace, is not the name of any country known either to ancient or modern geography. It designates a union of several States of Germany under one common custom-house law,—a policy, not a country,—which brings under one series of fiscal regulations, concerning import and export duties, the subjects of several States of Germany having somewhat different laws and lying widely apart. It embraces Prussia, Saxony, Wirtemburg, Bavaria, Baden, Nassau, the two Hesses, and all the minor States of the centre of Germany, and contains altogether somewhere about 26,000,000 people. Hanover, Brunswick, Oldenburgh, Bremen, Lubeck, Mecklenburgh, on the north; Bohemia, Austria Proper and other German dominions of Austria, on the south, are not members of this Union. Prior to its being formed, the 37 States, large and small, into which Germany was divided, levied each its own duties and tolls on rivers and roads, and had its own custom-house officers to levy them. As the rule, no goods could be transmitted through any one of these States to another, or sent from one to another, without being subject to all the vexatious delay of a custom-house examination at the boundaries of every State. The actual facts were still worse, for many noblemen and cities levied, till a very recent period, private tolls; and as their "bars" all goods were liable to a similar examination. The annoyance of this system, to say nothing of the accompanying annoyance of passports, which still continues, was immense, and far exceeded anything of which our people, long united under one Government, and having amongst themselves internally a perfectly free communication, have ever practically had to form any conception of. To get rid of some of these vexations, the States above mentioned, under the influence of Prussia, united themselves about twenty years ago into one body abolishing all intermediate tolls and custom duties, and levying only duties common to all, at the one extreme boundary of the united States, and dividing the revenue accruing among the different States composing the union, in proportion to their size, population, consumption, and previous revenue, &c. The States not in the Union, and the other German States, preserve their own revenue laws; and, so far as trade and customs duties are concerned, may be considered as foreigners. The readers will see, therefore, that the name Zollverein in the Exhibition is a mere political designation for a great part of Germany, separating it from Northern Germany on the one hand, and from the Austrian dominions on the other; and such products of the industry of the 26,000,000 people comprised in the Union as they are pleased to exhibit, it is now our intention to describe.

The department of the Zollverein is in the eastern part of the Crystal Palace, approximating towards the centre. It extends on both sides of the Nave into the galleries, as well as on the ground-floor; has Russia on the east and Austria on the west. Intermingled with it, however, is the space appropriated to Northern Germany, an arrangement justified by the geographical relations of the two, but at variance with the political designations, and the source of some confusion. In truth, disorder in arrangement, singularly enough for the methodical Germans, seems to us to characterise their part of the Exhibition. Although Wirtemburg, Saxony, and Bavaria have distinct exhibition rooms on the south side of the Nave, in which to display their cloths and shawls and stockings; in the Grand Centre Hall of the Zollverein on the north some of their most distinguished products, and the most distinguished products of the other states, are mingled with the products of Prussia, which disables us from forming a just appreciation of the industry of the separate people, or of the whole Zollverein. In the medley, we cannot compare and contrast what has been done by the lively, vain, egotistical and royal Prussian with the productions of the more solid and somewhat duller electoral or grand ducal Hessian; nor can we conveniently distinguish between the industry which is rooted on the Iser and that which flourishes on the Elbe or the Rhine. The arrangement which deprives the several people of their customary distinctions, to unite the exhibition of their industry under one political name, does not seem to us to be a happy one. If it could give them a political unity, and make them one state, as they are one people in language and literature, getting rid of the expense of many sovereigns, many courts, and many separate functionaries, we might hail it with satisfaction; but in the Exhibition it only loses them in Prussia, and drowns all their peculiarities in one muddy political stream.

The general remarks which follow apply in a great measure to the industry of all the Germans, not excluding even the Austrians, though we have described separately the Austrian part of the Exhibition; and we must, therefore, make our readers fully aware of the number of people to whom they apply. The Zollverein contains about 26,000,000; Northern Germany, about 4,000,000; and Austrian Germany, about 7,000,000. The country they inhabit extends from the Baltic to the Iser and the Rhine, from the German Ocean to the Carpathian Alps, and embraces a great variety of soil-surface and climate. It is rich in minerals and raw products, and is traversed by numerous large rivers. It is the best and principal part of central Europe. For such a country and such a people, the exhibition of their industry strikes us as comparatively poor and comparatively uniform. There is a sameness in it throughout, not met with in any other part of the Exhibition of equal pretensions.

In one great natural quality Germany is deficient, and the want of it has been much aggravated, instead of being relieved, by the policy of its governments. It has comparatively a small extent of seacoast. Denmark and Holland shut it out from a direct connexion and communication with two parts of the ocean. It has had, therefore, in

THE ZOLLVEREIN COURT.—FROM A DAGUERREOTYPE BY BEARD

relation to other states, a small and not fast-growing foreign trade. The many small states into which it was divided, and the absurd fiscal regulations in each, aiding the want of ocean communication, till very modern times limited and hampered its internal traffic. The consequence was, that the subjects of each state were pretty much confined to their own products for subsistence; and comparatively little separation of employments, or little division of labour ensued, and, as a consequence, little variety in the industry of the people. The Germans rather pride themselves on the circumstance, that division of labour is not extensive amongst them—that they are what they call many-sided; but that is only an approach to barbarism, when every individual provided by his own means for all his own wants. To satisfy the common demands for food and clothing they all necessarily adopted the same or similar arts; and the same causes continuing to prevent the separation of employments, they have continued the same or similar practices. In conjunction with this, too, the restrictive governments undertook to a degree unknown in England to guide the industry of their subjects; and as they were generally actuated by a similar policy, and had similar objects to attain, they generally directed the industry of the people in similar paths.

After the wants of food and clothing were supplied, the great object of the different governments, besides the common desire of military power, was to have luxuries provided for courts, which for a long period borrowed their ideas of luxury from the French court as a common model. Accordingly, as you pass palatial apartments hung full of cloth and of damasked linen, with a profusion of swords and cutlery, walking-sticks, pipes, buttons, and common tools, models of old castles or modern residences, remarkable only as the birth-place of a Prince (in the English collection are models of our sea-ports and chain and tubular bridges), with some fine porcelain, some exquisitely carved ivory, some delicate bronzes, and some admirably stained glass, you find a great uniformity in the products, of numerous distinct and different people, for which you were hardly prepared; nor is the impression changed by some well prepared leather for different purposes, some valuable mineral and other raw p oducts, several specimens of wood, and some splendid crystals and colours; the result of chemical arts, and a little well-wrought furniture. What is called Berlin-wool, raised carpeting scarcely fit to walk on, models of castles, dried fruits, a multitude of ornaments in cast iron, an abundance of toys, playing cards, much jewellery, piles of stockings and suspenders, with a few printed books, scarcely redeem the whole from an appearance of frivolity as well as uniformity.

Many of the articles would excite surprise in any exhibition, but we are astonished to find them so many leagues away from the place where they were made. The Germans supposed they were to sell, as well as exhibit; they looked on the Exhibition as a market, and thought that the cheapness of their hose, their cutlery articles, their toys, and their cloth would ensure them numerous customers. In fact, many of their articles are avowedly exhibited only on account of their cheapness, not on account of their excellence, their rarity, or their beauty; and they have prepared and published a catalogue in which the prices are marked, for the very purpose of showing that they can undersell the English, particularly in hose, cutlery and cloths. Till the quality of the articles can be brought to a par, the same appears to be possible. They imitate our patterns, and try to sell their goods as English. We noticed, and to our surprise, in the Saxon department, and amongst the hose, one or two pair marked very distinctly, in good English letters, "Merino patent," such as used to be stamped on a favourite English production. We have some doubts of the propriety of allowing such *contrefaçons* to appear in the Exhibition. It reminded us of what we saw on the Harts a great many years ago, where the shot cast at a celebrated lead manufactory were all packed up in bags, with the names and labels imprinted on them of English makers. We were told by an American gentleman in the Exhibition, "It is quite true the Germans have improved very much in making cutlery within a few years. I have had a great deal to do with them in the matter. They were anxious to sell their goods in our markets; but they were determined our people would not look at them. I then sent patterns of your best London and Sheffield makers to Solingen, and the Germans made their cutlery after these patterns, putting on them the name of Rodgers and Son, or some other celebrated English maker. The German cutlery looked very well, and was sold cheap; but, on being tried, it was not half so good as that of the English, and I doubt whether the sale will increase." In various kinds of cutlery, that can scarcely be proved, the Germans make a great show; but it is evident even here, that the bulk of their articles are made after English patterns. They are intended, too, we believe, more for a foreign market, than for home consumption.

If the Exhibition were a mart, where the artisan could buy a pair of pincers, a dandy a cravat, a housewife a jar of preserves or of potted larks, and parents Christmas presents for their children, it could scarcely be richer in the supply of these and similar articles from Germany. With some exceptions, which it will be our business hereafter especially to notice, the products of German industry, taken as a whole, therefore, may be characterised as displaying little variety; and many instances of it are trivial, neither adding to national wealth nor helping forward national greatness. Admitting the fact, but implying that the Germans have a richer and more varied industry than they have shewn, which we doubt, a German writer in the *Allgemeine Zeitung* states "that Germany as here exhibited to foreigners as small change." Who, then, is culpable for having kept back the large coins and the more precious ingots, if they exist?

German industry is not only uniform, it is obviously imitative. There is as complete a want of independent thought in their art as in their political reforms. What they exhibit gives us a painful impression of an emaculated industry. We see few or no articles that can be called peculiar; and such as there are give no idea of vigour: cast-iron ornaments, children's toys, chemical crystals, are amongst the most striking peculiarities, and all of them are rather puerile than grand. The most popular part of their exhibition is a large collection of stuffed birds and beasts in a variety of positions and pursuits congenial to the animals. Around this, valueless as it is, a group proved generally gathers, though not a few persons turn away from the bleeding animals, pulled down by dogs or worrying one another, offended and disgusted. Such an exhibition, like the toys, is better adapted to children and the vulgar, than to mature and enlightened beings. Little or nothing is to be learned from it, even of the habits of animals; and it is of too little use and too much the work of an individual, to be worthy of a place in an Exhibition of National Industry.

France has its *bijouterie*, its exquisite ornaments, its unmistakeable graceful luxuries, its adornments for boudoirs and persons; England has its solid and compact machinery, often as neat and elegant in form, though rigid, as it is useful; the United States have their rocking and their other chairs, their sewing machine, and their almost infinite application of caoutchouc; Russia has its bijouterie, its hang, and malachite; even Austria, with its Vienna furniture and its Bohemian glass, and we are Germans, has something of its own. Nay, Tunis and India shine out conspicuous and peculiar. Only Germany, of all the nations of Europe, has nothing apparently in the Exhibition which can be said to be characteristic of it, but its toys, a few skull caps, and some useful specimens of domestic wool manufacture; borrowing its ornamental arts mainly from France, its useful arts from England, the things it exhibits are chiefly imitations, very often deficient in the grace, the lightness, the neatness, and convenience of the originals. Its productions are solid, substantial, sometimes cumbrous, and generally honestly made, but they are all in the main French or English, rather than peculiarly German. Perhaps those who have had the direction of the matter have wished chiefly to exhibit the success of the Germans as rivalling other nations, and have rather brought forward European than German productions. They have exhibited no specimen of their durable but old-fashioned furniture; of their *frachtwagen* with goods packed and secured to resist the jolting of bad roads, like the cargoes of ships, which never rot when tossed about by the waves; no specimen of their multifarious vegetable productions on which the bulk of the people live, or of the useful and comfortable garments that form their domestic industry still provides for the great multitude, all of which are at once peculiar and picturesque; they are sometimes, too, convenient. Germany has many peculiarities, but they belong to a past age, and the Royal Commissioners, who have presided over the German part of the Exhibition have not been desirous to exhibit them. "I cannot help," says the writer already quoted, "that, in general, the specimens of German industry in the Exhibition (the fine arts are not included) have no peculiar character, and that the idea of its having been the intention to avoid exhibiting what is national. German industry appears in every department to lean on something foreign, or to be an imitation, and nowhere to stand on its own feet. At one place we see the hand of England, and at another that of France. I may be mistaken, but this is my very distinct impression." If we turn to the machinery exhibited, we shall find it of little importance; and the principal objects, such as the vacuum pan and the Jacquard loom very imperfectly improved as compared with others in the Building, are borrowed from England or France. The machinery exhibited, and generally too the tools and the cutlery, are imitations of those of England, and can have nothing to recommend them, if it be not their cheapness.

The nature of German industry in general is brought into a strong light by the varied industry of Hamburgh, and the fasts displayed in the exhibition of the articles sent from that city. It has furnished no less than 123; while the rest of North Germany, the kingdom of Hanover, Lubeck, the two Mecklenburghs, have supplied only 35. They consist chiefly of useful and ornamental furniture, such as side-boards, sofa-tables, &c., of a very superior description; of clocks, musical instruments, specimens of oil-cake and refined sugar, charts, pianofortes, saws, looking-chairs, looking-glasses, bird-cages, and a large assortment of walking-sticks. Here, however, instead of being merely hung against the wall, they are displayed in a cheerful tasteful manner, so that the Hamburgh room has a light and elegant appearance, superior to that of the central room of the Zollverein, in which are heaped together all the finest products of its contributions. On entering the apartment, the spectator is much struck by a representation of the sun sending his rays on all sides placed against the opposite wall of the apartment. It is composed of walking-sticks, chiefly from the workshops of C. A. Meyer, who employs above three hundred persons, and exports walking-sticks to all parts of the world. In Hamburgh, as in London, it is a considerable trade; and, as a source of wealth, is not inaptly typified by the sun. Herr Meyer, the founder of the house, is a good specimen of what trade does for men in Germany as well as in England. He arrived in the city from Thuringia, with no other wealth than his skill in carving wood; and, by care, frugality, and an opportunity of exerting his talents, he has created a large establishment, and become one of the principal merchants of the city. He is an individual example of the general prosperity and general industry and skill of Hamburgh. It was, and yet is, practically and truly free—not merely nominally a free city; and the success of its industry as displayed in the Exhibition in comparison with the industry of the many long-enthralled states of Germany, fully bespeaks the blessings of freedom.

The products, too, of German industry exhibited in the department of the Zollverein are as ill displayed, if we except the entrance to its most patron compartment on the north side and the hall in the centre, as it is uniform and trivial. No one mind seems to have presided over it to bring out its advantages, though the superintendance has been confided to a Royal Commissioner. There is a want of order and symmetry in the display of the articles, which, coming from different places, are confusing as a study. The compartments have been compared, but rather harshly, to the booths of Leipsic fair. The articles are arranged without much regard to effect. The masses of cloth in one place hung up to the ceiling and hanging down to the floor, reminded us of St. Bartholomew's fair; and the great mass of common cutlery tools stuck against the wall in another, of ironmonger's patterns, such as a travelling Yankee pedlar would display. Birmingham carries about with him what is, perhaps, a better order.

Saxony, Bavaria, and Wirtemburg have, for part of their exhibition, rooms to themselves, and those of Saxony are neatly, though plainly, fitted up. But they are denuded of their richest and best ornaments to place them in the centre room, where Prussia tries to absorb all the glory. This arrangement has a doubly ill effect: it heaps all the very elegant and most admired products in one room, where the abundance of them tends to dazzle and bewilder, and it deprives the other parts of the German exhibition of ornaments that would redeem them from the reproach of being "all grey."

Adding the imperfect arrangement of the single articles to the mingling together the products of different States, the Zollverein seems on the whole, one of the least satisfactory, if it be not exactly one of the least elegant parts of the Exhibition.

As we have already adverted to the Sculpture, including that from Germany, we do not extend our present remarks to that letter. It stands on a different footing, and is treated of with reference to its value as a product of the mind. German sculpture takes a high, if not the first place in the Exhibition, but that art, though treated successfully by the Germans, we need scarcely remark, is not peculiarly German.

Passing from this first and general impression to notice particular objects, we enter from the east end of the Crystal Palace the first department of the Zollverein on the north side. Our attention is arrested at the entrance by an object which forcibly reminds us of the military character of the principal State of the Verein, and indeed of all the German States. Planted at the centre, as if to forbid entrance, or at least to allow it only on conditions, stands a remarkably well mounted field-piece. The gun gives you the idea of solid and substantial work. At the same time it is highly polished; and the plain varnished carriage is a perfect model, on a small scale, like one of Maudslay's engines, of compactness and easiness combined with great strength. The workmanship has the finish of a jewel, concealing its instrument of power of a demon. Beneath it are polished cuirasses and other instruments or ornaments of war, destruction, and death. This is the shape in which an invention of a new process for the manufacture of one of the most useful things shown in the whole department, cast steel, is exhibited. We admire Herr H. Krupp's skill, but should have thought better of him and loved him more, many had it been displayed in rollers such as are employed with great success at Sheffield, for grinding corn, or surgical instruments, or something more appropriate to this peaceful age and to the Exhibition, than a model field-piece.

Close by it, however, inviting you to the confidence which the gun repels, hangs an altar-piece, in which are worked and emblazoned the words "*Gott sei die Ehre; und wer so Gott Liebe bleibt, der bleibt in Gott, und Gott in ihm*" ("God is love; and who dwells in love dwells in God, and God in him"). There is not much in the article to admire, but the sentiment is very expressive of the affectionate kindly character of the Germans. The article, to provide amusement and employment, as well as instruction for their children, is exemplified in one of the most chief manufactures, and which a rugged hard people would have neither patience to begin nor the kindliness to continue, is another illustration of the same characteristic. The more one traces their kindliness in their manners, the more it is to be regretted that a country of such people should over their affairs, as typified by the field-piece. The softness of their character seems to allow a long dominion to a harsh political system; and a little more general energy amongst them would keep better in check the violence against which they now only direct a few enigmatic sentences.

Passing through, with some indifference, rows of arms, perhaps the spectator may be arrested in attention momentarily arrested by the various specimens of crockery, earthenware, or china manufacture in the neighbourhood of Frankfort on the Oder. It is clear, solid, and generally of pleasing forms. It is scattered about the Building, but some of it is to be found on the north side, after passing through the first apartment from the east. It approximates more to our stoneware than to anything else that we are acquainted with, but is superior to that in its clear uniform colour. For neatness and utility, it is scarcely surpassed in the whole collection. The porcelain, both of Saxony and Prussia, is, of course, much more splendid; some of that of Prussia is admirable, and seems to find numerous customers, for several of the articles of the Berlin manufactory were marked "disposed of;" but the porcelain, with its admirable paintings, comes within the reach of a few, while the elegant and clean-looking *thoncasares* is attainable by the many, and must contribute to the pleasures of all who use it. This ware is largely exported to connect with which England trades; and we are inclined, therefore, to suppose that it must be as cheap as our ordinary ware, and it is, generally speaking, more elegant, and more tasteful. Combined with several other things which come from Frankfort on the Oder, it gives us a much higher idea than we had before formed of that city as a place of manufacture.

From the very circumstance that much of the cutlery, particularly that from Solingen, is made after English patterns, it is, on the very good, and much superior to that which was formerly, and is still very much in use in Germany. Some of the surgical instruments, too, are very good, and are much better in Berlin than in any other part of Europe. Some of the common jewellery, the supply of which is large, is well set; but the bulk of it, as is to be expected from the quantity, is common, and rather tasteless.

Germany abounds in metals; all the zinc in use comes from there; but, with the exception of its being applied to the roofs of houses, a model of which is exhibited, showing some very substantial workmanship and for spouts, we noticed no other important application of this ductile, and now much used metal. Those who have visited Germany must be well aware that there are numerous articles which it supplies in most advantageously worked, and would contribute more to the health and comfort of the Germans, and the neatness of their houses, than most of the poor articles they exhibit.

Passing to the West and North, opposite the room for the machinery of the Zollverein, we observe two specimens of massive safes for money and papers. One is remarkable for the ease with which its heavy doors are moved, and the other for the impossibility of opening it without receiving instructions from the maker, and both for their many conveniences. Four of them, we have seen it stated, have already been ordered from Germany, in consequence of their having been seen here.

The machine-room looks bare, and at least is quite spacious enough for the machinery the Zollverein chooses to place in it. We believe that Germany is richer in such contrivances than the Exhibition shews. We should pronounce it very backward, were we to judge of it solely by the specimens here. Cards for combing, made of imported materials, seem to us very inferior to those made in Manchester. Engines for coining, punching, and milling are good, but nothing extraordinary. The Jaquard loom and vacuum pan we have already mentioned, and the other machines are too trifling to merit notice.

Civilization and the power of man are directly in proportion as he is enabled by skilful machinery to command the assistance of nature. As he makes the expansive power of steam, or the weight of the atmosphere, or the rushing of streams, work for him, he is strong and powerful. Machinery being generally private property, men cannot be constrained to display it when they fear that the secrets connected with it may be discovered; and hence the samples in the Zollverein are not specimens of the best machinery of Germany. If they were, we should form an unfavourable opinion of the past, and a very unfavourable augury for the future of that country.

Now coming back to the south, we enter, on the great centre room of the Zollverein, crammed full of the *bijoux* of German art; but we must reserve what we have specifically to say of that and other parts of the exhibition of the Zollverein to another occasion.

CLAYS, SANDS, AND EARTHS, AND THE OBJECTS MANUFACTURED OF THEM.

THE estimate of value and interest attaching to natural substances, which form the basis of great manufactures, is often little proportionate to the real importance of the objects in question; and the general reader, as well as the visitor to a large collection, a museum, will be apt to pass them by for the more attractive *results* presented to his notice. Thus, amongst the visitors to the Great Exhibition, thousands examine and admire the porcelain and the glass, while few are found considering the clays and sands from whence these beautiful substances are derived; and this kind of indifference extends even to the simpler and more common manufactured products, when these are so widely employed as to attract no attention by novelty of appearance. Thus it is that the bricks, tiles, and other like objects, are readily passed by as being to a certain extent, and for most purposes—*raw materials*.

The collection of earths, sands, and clays, and simple manufactures from them, as seen in the Exhibition, possesses, however, much interest, and deserves more than cursory notice. The British part of it is arranged chiefly in Class 1 on the south-western side of the Building; but numerous specimens from various foreign countries may be referred to, and will repay the trouble of discovering them in many nooks and corners, chiefly on the south side of the central avenue. We may divide the whole into materials for the construction of bricks, tiles, and other similar articles, including all kinds of refractory brick, materials for the manufacture of earthenware, pottery, and porcelain, materials for making glass, materials for agricultural use as mineral manure, and miscellaneous earthy minerals used for various purposes.

The qualities of a good clay for brick, and tile making are not so peculiar as to induce any difficulty in their discovery in most parts of Europe. The clay so abundant everywhere, or within a reasonable distance of most places where human beings congregate, is generally capable of being adapted for use in this way, and requires only that there should not be too large a proportion of alkaline earths, as potash or soda, although a little lime is no disadvantage. The uses vary with the quality, but, perhaps, we may mention as one of the best of all the clays exhibited, some specimens from the estate of Lord Kanisklien, Florence Court, Ireland, which, with articles made from it, are shown in Class I, (No. 116), and also in Class 9, amongst the agricultural implements. Some other samples of brick and tile clay are shown, but the variety is not considerable. They will be found in Class 1, No. 115, 119, 127, 127A, 128, 129.

The manufacture of bricks is somewhat largely exhibited, and several varieties of construction may be mentioned as new and interesting. Of these the hollow bricks shown in Class 27 (No. 124, and France 417). are the most remarkable, and best worthy of notice. The former, sent the Society for Improving the Condition of the Labouring classes, consists of a brick considerably larger than the common size, and having one large open hollow in the centre of a small recess in the top and bottom for mortar. Bricks thus made are very quickly and thoroughly, and are admirably adapted by their comparative lightness for various purposes in fireproof buildings, and for party-walls. They are also much cheaper, bulk for bulk, than ordinary bricks, and we may fairly anticipate a very large consumption as soon as their great value becomes known and appreciated. The very curious and interesting machinery invented by Messrs. Bovie, and applied by them to a similar manufacture in France (No. 417), deserves notice also, as producing an amount of strength with a small consumption of material and greatly diminished weight, which, if in any sense economical in the first cost, must have an extraordinary value. These bricks of M. Bovie's manufacture are very much larger than those at present used or those just described, and can be made of considerable length if required. They are extremely strong, and must be very compact and readily dried. They contain several small hollows, and in this respect and the mode of manufacture are entirely new.

Other new kinds of bricks are exhibited by Mr. Workman (Class 27, No. 116), who has invented and patented a new process for rendering them waterproof at small cost; and by Mr. Haddon (Class 27, No. 114), who has manufactured them of a rhomboidal form, ensuring their bonding. There are also a number of ornamental bricks, of which some sent by Lord Lovelace (Class 27, No. 87) are interesting and ingenious; and others, by Mr. Ambrose (No. 128), also indicate taste and good material.

Amongst the foreign goods of this kind deserving attention, we must now turn to the bricks and tiles exhibited by the establishment of M. Miesbach (Austria, No. 612). The raw material is not sent with the manufactured article; but these latter are highly recommended, and the statements concerning them sufficiently remarkable, to justify an extended notice. From an authentic account before us, it appears that one brick and tile factory (the largest of several), belonging to M. Miesbach, and situated close to the city of Vienna, occupies upwards of 250 English acres. On which are drying-sheds 25,000 feet in length, adapted for common bricks, forty-three kilns, capable of burning three millions and a half bricks at a time, and more than 8300 feet of drying-sheds for roofing tiles and ornamental work. The annual make of bricks from this establishment is 65,300,000 of bricks, employing in all nearly 3000 persons in the manufacture. It should be observed also, that this is only one of seven large establishments belonging to and worked by the same manufacturer, who employs in all nearly 5000 persons, and sells upwards of 107,000,000 of bricks per annum. The colour and texture of the bricks and tiles are admirable, and the selling price is almost inconceivably low, considering the cost of fuel and the price of labour.

Besides bricks and tiles of the more common kind, there will be found from various countries excellent specimens of tiles, both for roofing and paving, which do much credit to the exhibitors. The so-called *terra-mettaio* of Mr. Peake, (Class 37 (England), No. 123; the collection sent by Mr. Haywood (Class 27, No. 127); and the Italian tiles of Mr. K. Brown, of Surbiton (Class 27, No. 147) are all very respectable, and indicate a satisfactory state of the manufacture. New forms of roofing tiles are exhibited by M. Amsler (France, 406), and various draining tiles, by many persons, chiefly English. Of all of the objects of this kind, however, the mosaic tiles of Mr. Minton (27, 86) are much the most remarkable; and, as they involve an important peculiarity of construction, which may easily escape notice, the principle may be well worth describing in this place, especially as it involves a very simple application of raw material.

Up to the year 1839, there was no satisfactory method in use for manufacturing durable mosaic pavements at a moderate cost, and Mr. Singer in that year took out a patent for a mode of forming little cubes for mosaic-work, of ordinary porcelain, which, being arranged in patterns, was afterwards cemented at the back. A pavement of this kind is exhibited, (Class 27, No. 68), in which the tesserae have been made in the usual way of porcelain clay, baked in separate cubes before being laid down. In 1840, Mr. Prosser, of Birmingham, discovered that if the

material of porcelain (a mixture of fine clay with flint) were reduced to a dry powder, and in that state subjected to enormous pressure between steel dies, the powder is squeezed into about one-fourth of its bulk, and compressed into a compact solid substance of extraordinary hardness and density, much less porous and much harder than common porcelain after baking. Cubes made in this manner, of coloured clays, and baked in the usual way, but either glazed or not, are laid down on a flat surface, and cemented into convenient shapes and patterns with fine Roman cement, worked in to fill the crevices between the blocks. The effect of this ingenious manufacture is singularly beautiful, and the durability perfect. Patterns are easily and accurately obtained, and the richest intricate intersections of grotesque and arabesques outlines readily executed

The material of which Minton's mosaic tiles are made is essentially a porcelain clay, and of such substance there is a large and most interesting group to be found in Class I, No. 93 to 110; besides other displays of similar material from China and elsewhere. The China clays consist of the argillaceous or clayey part of decomposed granite, collected and sifted, either naturally or artificially, by the agency of water; but they include a larger percentage of silica (flint), to which a part of their value is due. Such clays abound in the neighbourhood of the granite bosses of Cornwall and Devonshire, and have hitherto been chiefly worked at and near St. Austell, where the supply is too large to be easily reduced. Recently, however, works have been erected on the southern extremity of Dartmoor, and of the material here obtained, and the porcelain made from it, examples are shown by Mr. Phillips (Class 1, No. 101).

A considerable quantity of clay, of coarser kind, is also obtained from Dorsetshire; samples of this are shown by Messrs. Pike (Class 1, No. 109) and Messrs. Whitaway, Watts, and Co. (Class 1, No. 90). In the manufacture of the finer kinds of porcelain, great care is taken in mixing the finest and purest clays with a due proportion of silica and other material, obtained partly from burnt and pounded flints, and partly from an exceedingly pure felspar known as china stone. Of the latter some extremely beautiful specimens from a vein recently worked in Cornwall are well worth examination, and are already in considerable use. Varieties of felspar from America have been occasionally introduced into the potteries, not withstanding the cost of transport; and it is understood, that much of the beauty of the parian ware is due to the admixture of this ingredient

Pipe clay is another substance of great importance, and of which many specimens, in their raw and in various stages of manufacture, have been sent for exhibition.

The Stourbridge clay, of which Messrs. King and Co. (Class 11, No. 1) and Mr. Cowen (Class 27, No. 112) send good samples, together with various objects made therefrom, is one of the best known and most highly valued in this country. It occurs beneath the coal in the coal measure of Stourbridge (Worcestershire); and a similar, or nearly similar, material is very common, in like positions, in other parts of the country. Clay of this kind requires to be free from all alkaline earths, and from iron; but it is generally deep-coloured by carbon, and most kinds exhibit a peculiar fracture, owing apparently to the condition of the clay. The articles made of it are gas retorts, fire-bricks, smelting pots for steel, brass, &c., where long exposure to intense heat is required. In the case of retort-making, the use of clay is now altogether superseding the iron tubes long employed, and the advantage is considerable in all respects; as, in this process, it is in the highest degree essential that the material and workmanship should be of great excellence, while the cost must not be excessive. The manufactory of Messrs. Cowen is well known for the excellence of the goods of this kind supplied, and their cheapness and the reputation of the house are well sustained in the Exhibition. The form and texture of the gas retorts, and the perfect state in which they are presented by their exhibitors, are highly creditable. Several excellent articles of the same kind are shown also from Belgium and France, although we may safely say that neither of these countries can be considered to have surpassed our own in material or workmanship

Besides gas retorts and fire-bricks, we have also a great display of plumbago crucibles, or rather crucibles made of refractory clay, with which a large quantity of plumbago is mixed to render the whole sufficiently porous when used to allow of a small amount of expansion, and thus capable of resisting the most intense heat of a wind furnace. Mr. Reed, of Hotborn (Class 1, No. 435), sends a fine series of such articles, for which he has a great reputation; and some German makers have also forwarded specimens of their care in manufacturing remarkably large and beautiful plumbago crucibles, which have every appearance of being of excellent Cappelian (Wirtemberg, No. 28) and Coste (Belgium, No. 397), are, perhaps, the best-looking; but it is difficult to estimate the relative excellence without a trial.

While speaking of chemical apparatus, we must not neglect that of Messrs. S. Green and Co., of Lambeth (Class 27, No 125), which is a model of ingenious and neat contrivances. A gigantic jar for acids, the largest, perhaps, ever made, and an angular worm of a still, which admits of access throughout for the purpose of cleaning, as well as an acid pump, are well worthy of close attention

It is of course chiefly in connexion with manufactures that we can profess to give any special interest to the various kinds of clay; and thus, to come back to the main object of this paper, we would advise the reader to study their vast series as that exhibited by Mr Minton (Class 1, No. 97), where the specimens all serve to illustrate processes; and that of Mr. Phillips and others, where the relation of clay and derived porcelain are very well shown. The former being the collection of a manufacturer, and chiefly illustrating the best processes of manufacture, while the latter are sent from the producer of raw material, and the objects being therefore quite distinct, they may well be examined together.

Besides the clays already referred to, there are several other kinds adapted to different uses in the arts. Thus we have the common, but purer kinds of clay used in works of terra cotta, or partly burnt clay, of which there are numerous and beautiful specimens in Class 27. A still purer, and much more plastic clay, is used for pipes; while a peculiar variety, containing a very large percentage of water (essential to its constitution, and not rendering the mass damp), is known as "fuller's earth," and is much used in the clothing districts for preparing cloth, owing to its remarkable power of absorbing grease. Large quantities are obtained from near Reigate, in Surrey; and the various stages of preparation are shown by Mr. Cawley (Class I, No. 47), and Messrs. Gibbroger and Hyman (Class 1, No. 48).

Sands are used for various purposes, and several kinds will be found exhibited in Class I. Among these the casting sands of Sir T. Wilson (49) and Mr. Collinson, of Mansfield (75), are remarkable for all those qualities that give value to the material. The purity of the sand, the evenness of its grain, and the consequent smoothness of the moulds made are all favourable for moulding and receiving the metal. Such sands are not found everywhere, and where they do exist bear a high price. They are often deeply coloured with oxide or silicate of iron, but this is not considered a disadvantage.

White sand is used to a large extent in glass making; and some of the best of this kind employed in London, Birmingham, &c., comes from near Aylesbury (Dr. Lee, 128), from the Isle of Wight (Cinxton, 73, and Squire, 74), and from Reigate (Reif, 76, and Messrs. Rowe and Somers, 75). Till lately, no sand from any English locality was delivered in nearly so pure a state as that obtained in Paris and other cities on the Continent; but there is little reason why this should be the case, and there is nothing in the finer and better of our sands that renders them in any way inapplicable for the best purposes of glass-making, provided due efforts are made to remove the small impurities that can be conveniently got rid of. The sand exhibited by Dr. Lee, of Hartwell, and already referred to, is the finest and purest of those which we have seen, is of considerable value. Together with the sand will be found some objects of glass, such as prisms and globes, manufactured of it, to show its quality. These give a good opportunity of noting the absence of colour when a great thickness of glass is looked through.

Besides these fine kinds of sand, and others used for special purposes in the arts, there are also sent from the Isle of Man and Cornwall complete series of the earths and sands of the district. The latter are worthy of note in illustrating the use of calcareous and other sand for the mineral manure. Many thousand tons of these fine sands, which consist of little else than comminuted shells, and retain a certain proportion of animal matter, are annually carted from the south coast of Cornwall into the interior, for the purpose of enriching some of the poorer soils. (See Rouse and Whitley, Class 1, No. 150.) Samples of another kind of earth manure, obtained from sewage and deodorised, are also exhibited in Class 1 at No. 1, by Mr. Gill, of Truro (Class 1, No. ...), although they properly belong to another class.

Together with sands of the ordinary kind, we may take the finer kinds obtained generally from river silt, or elsewhere, under very peculiar circumstances, and used in the arts as polishing powder, under the name of Tripoli or rotten-stone. Recent and very minute researches on the microscopic structure of the particles that give its peculiar value to this kind of substance have fully demonstrated that they are almost entirely the skeletons of infusorial animalcules living in infinite abundance in moist earth, an of such extremely small dimensions that millions would be required to form a cubic inch. Prepared Trent sand and Welsh rotten-stone are exhibited by Messrs. Flather and Haden (Class 1, No. 80.)

Ochres form a group of earthy minerals, coloured by metallic oxides, or consisting chiefly of them, which are exhibited not only in England (Class 1, No. 40 and 92), but in several other countries, of which we may mention Nova Scotia, Trinidad, Van Diemen's Land, and France. They are chiefly oxides of iron, and of red or yellow colour. Those sent by Messrs. Jenkins and Beer (Class 1, No. 92) are in different conditions, as used in the arts, and are of very good quality. The ochres from Brostol, forming part of the very interesting and carefully selected series of Mr. Howard (Class 1, No. 29), are also worthy of notice for their purity and depth of colour.

The earthy materials from which various kinds of cement are manufactured are represented in a few cases, but none of them are very remarkable. The Ipswich Museum committee have sent specimens of the mineral nobles of their neighbourhood, including the well-known Harwich septaria, or stones from which Parker's and Roman cement is made; and from Greece we have some fine samples of puzzuolana, much used in that country for building Corinth and septaria from various parts of the country (especially Derbyshire and Lincolnshire for the former, and many of the clay districts for the latter) are shown by Messrs. B. White and Son (Class 1, No. 1 and Messrs. Bayley and Jacobs, for the purpose of illustrating the finished manufactures which they also exhibit. Both these substances require to be burnt and powdered before using; and in this state they cannot assume the set of hydraulic without a certain quantity of water which they absorb greedily with the emission of heat, they are capable of being used, under management, as hydraulic cements, setting or hardening under water

We have already referred to the mineral manures obtained from the sea-coast of Cornwall, and consisting of minute particles of shell accumulated in vast masses, and still retaining a portion of animal matter. There are, however, other substances found in the earth admirably adapted to supply those salts required to grow corn crops repeatedly, supplying that peculiar element, phosphorus, which seems absolutely needed as an ingredient in the food of man. Such material is obtained from animal manure of all kinds, but then rapidly disappears; and it is not long since the advance of chemistry, and its application to agriculture, has so clearly demonstrated both the fact and the cause, as connected with the fertility of soils, that the subject of mineral manures is becoming daily more and more important. The recent discovery, on the east coast of England and elsewhere, of nodular deposits of gravel, consisting of phosphate of lime and capable, by a little chemical manipulation, of forming a most valuable manure to mix with the soil, has tended to bring the subject more prominently forward, and has naturally been connected with the specimens of the mineral products of our coasts.

These nodules of phosphate of lime were, no doubt, originally deposited in the beds of ancient accumulated in various beds during the process of their deposit. They have hitherto been met with in two positions only. In one of these, namely, amongst the sands (upper green sand and gault) near Farnham, and generally the same geological series and the chalk hills of the south-east of England, they are found *loosely in situ*, and are unquestionably accumulations modified, if not produced, long after the original formation of the rock in which they occur. In the other case they are found at the bottom of the upper beds of crag on the coast of Suffolk, and are manifestly accumulations of rolled pebbles once forming a sea beach, and deposited in their present form. Good examples of both these will be found exhibited both by Mr. Paine (No. 36 and Mr. Nesbit (No. 46), but chiefly by the former, similar to the Farnham beds are concerned. The Ipswich Museum committee (No. 86), show a good series of the Suffolk nodules. The percentage of phosphate of lime in these nodules varies from 30 or 40 up to 70 per cent., and is sometimes even higher in small heaps. They are converted into a soluble superphosphate of lime by the action of sulphuric acid, and in this state are available for agricultural purposes.

Among the subjects fitly considered under the head of earths must now be mentioned one which will, at first, be thought out of place—we mean that which is commonly called *black lead*, or plumbago, but which is, in fact, a form of carbon, only different in condition from the coals so extensively distributed in our country. Black lead is by no means a rare substance in nature, but in the compact and peculiar form in which it can be conveniently manufactured into pencils it is very seldom that blocks of any size are found. The best are from a single mine in Cumberland, which has not yielded any supply for many years. Other are obtained from Ceylon, Bohemia, Spain, and other places; and an admirable collection from all known localities of importance is exhibited by Mr. Brockedon (Class 1, No. 65), who also shows some interesting processes by which the powder, otherwise almost useless, is rendered available for the manufacture of fine pencils. Mr. Brockedon is not the only exhibitor of black leads, but the others chiefly exhibit repetitions of the same. process. The peculiar mode of preparation consists in producing an extremely powerful compression of the particles when in a state of fine division, and is thus described:—The mineral in a state of impalpable powder is deprived of air under an exhausted receiver, and then condensed in a dry state, a mass weighing seven ounces being consolidated by two blows in a press, with a force of 5000 tons, leaving it perfectly compact and solid; and from these blocks slices are cut and inserted in channels in cedar, as is done in the manufacture of pencils from solid masses of black lead. The use of this process is so considerable that it has almost superseded the necessity for having the natural mineral in the rarer and more expensive form.

We have thus endeavoured to give the reader some idea of the general contents of the Exhibition, in the case of several groups of objects not very attractive, and for the most part only indirectly connected with such manufactures as are likely to attract notice. It is to be hoped that the really valuable and useful objects briefly alluded to will not be utterly neglected and lost sight of during the period of the Exhibition itself, surrounded as they are with more showy materials; and that when these more costly products shall be removed, the others may still remain, to be referred to by the mechanic and tradesman, as well as to instruct those who are being educated for various practical employments connected with the arts. That some selection should be made and retained from the new material of this and other countries, is, indeed, highly to be recommended, and we believe that her Majesty's Commissioners have already sanctioned an application to exhibitors, suggesting that it might be advisable to retain such objects as have no great intrinsic value, except as representing the usual condition of materials having a certain less extensive use in the arts. There can be no doubt that the nucleus of a trade collection of industrial objects thus formed, and the existence of a convenient place for their preservation, would tend greatly to advance the best interests of manufacture in this country.

MACHINES EXHIBITED BY SHARP BROTHERS AND CO.

The well-known firm of Sharp Brothers and Co have contributed some good examples of lathes for turning the wheels of locomotive engines and other purposes: the first of these is called a Railway Wheel-turning Lathe, having two face plates each of 7 feet diameter, adapted for turning a pair either of locomotive or railway carriage wheels of that size, when fixed upon the axle or otherwise, without torsion. Two tires may be bored at the same time, or a wheel may be turned on one plate whilst the boring or bossing of a second wheel is going on, being attached to the other face plate.

The extreme distance between the centres of this lathe is 9 feet 6 inches, so that axles and wheels of the largest size may be turned in it. The advantages of this machine are, that the two tools employed have self acting motions, whereby one man is enabled to accomplish more than twice the amount of work than could be accomplished by lathes of the ordinary description

The second machine to be noticed is a key-grooving or slotting machine, which is used for cutting the key grooves in the boss of railway and other wheels, up to any diameter not exceeding 7 feet; having the following longitudinal, transverse, and circular self-acting motions, whereby it is particularly adapted for paring or shaping, internally or externally, crank-axles, crank-arms, connecting-rods, and other parts of locomotive, marine, or stationary engines.

The third is a planing machine, suitable for planing articles of metal not exceeding in size the following dimensions, viz. 6 feet long, 3 feet 6 inches wide, and 3 feet 6 inches high. In this machine the article to be planed is moved along by a traversing table, while the planing tool, or cutter, being attached to a cross slide, and so arranged that the machine itself, having been once put into motion, causes the tool to cut either horizontally, vertically, or at any required angle, without the assistance of an attendant

CABINET.—BY TANNER.

sheets are moved away from the rollers. The sheets are either cut into the proper width for lathe bands, or are stamped out for shoe soles, and various other purposes. For making tubes or pipes of gutta percha, a mass of the material is carried from the masticator to a horizontal metal cylinder furnished with a suitable piston, by which it is pressed forward into a die box kept hot by steam; at one end of

POPLIN PATTERN —MESSRS. ATKINSON, DUBLIN.

the die box are a series of perforations through which the plastic material is forced into a cup, from which it passes out round a core, in its proper tubular form, into a long tank of cold water, through the whole length of which it is drawn by a line passing over a pulley, and returning to the person in attendance on the machine. The pipes are then coiled up and removed to the store-room.

Another important application of gutta percha is that of covering the wires used in the transmission of electricity, either for telegraphic or other purposes. With this view, a contrivance somewhat similar to the tubing machine is used; but, instead of being made hollow, the gutta percha is drawn out into the tank of water with its continuous core of copper or iron wire within.

Before concluding the present notice, we may mention that Dr. Montgomerie, through whose disinterested act the British public became acquainted with the use of gutta percha, received the large gold medal of the Society of Arts, which, in addition to the gratification of doing good, is the only reward he has received for the introduction to this country of a substance the uses of which are but as yet partially known.

In our next notice of gutta percha, we shall bring forward the various applications of this really important substance which have been contributed to the world's great industrial display.

CABINET. BY W. TANNER.

The design of this Cabinet is very chaste and elegant, and is the more creditable as being entirely the work of an operative cabinet maker of Bath. We should be glad to notice more frequently attempts of this kind, on the part of workmen, to elevate their position by the development of their inventive faculties. The style of this piece of furniture is of the period of Francis I., the material Riga and pollard oak. The effect, in our opinion, would have been better if the latter had been omitted, and the wood all of one colour; as for the ebony slab, it is decidedly too heavy to harmonise with the rest of the work. These are, however, errors of judgment, which may easily be avoided in future. The finish of all the parts, the ornamentation of which is rich without heaviness or redundancy, exhibits admirable workmanship.

POPLIN PATTERN. ATKINSON.

We give another of Messrs. Atkinson's poplin patterns—an elaborate scroll work, which, wrought out in colour and gold, is remarkably effective.

OR MOULU CLOCK.—HOWELL AND JAMES.—DESIGNED BY MR. ADAMS.

OR MOULU CLOCK. HOWELL AND JAMES.

Amongst the elegant display of jewellery and decorative articles exhibited by Messrs. Howell and James, is a clock, after an exquisite design by Mr. Adams. It represents the hours dancing round Mount Olympus; and is finished with remarkable delicacy and artistic effect.

FURNITURE IN PAPIER MACHE. BY JENNENS AND BETTRIDGE.

This little group represents three of the numerous elegant productions

PAPIER MACHE FURNITURE.—JENNENS AND BETTRIDGE

in *papier maché* exhibited by Messrs. Jennens and Bettridge. The *legere* chair is of extremely graceful design, which is original and has been registered. The table and fire screen have all the lightness and delicacy of finish which suit them for a lady's boudoir. It is in these fairy-like productions of diminutive proportions that the light and highly ornamental material employed by Messrs. Jennens and Bettridge is most successfully introduced. To large and heavier works it is not so appropriate.

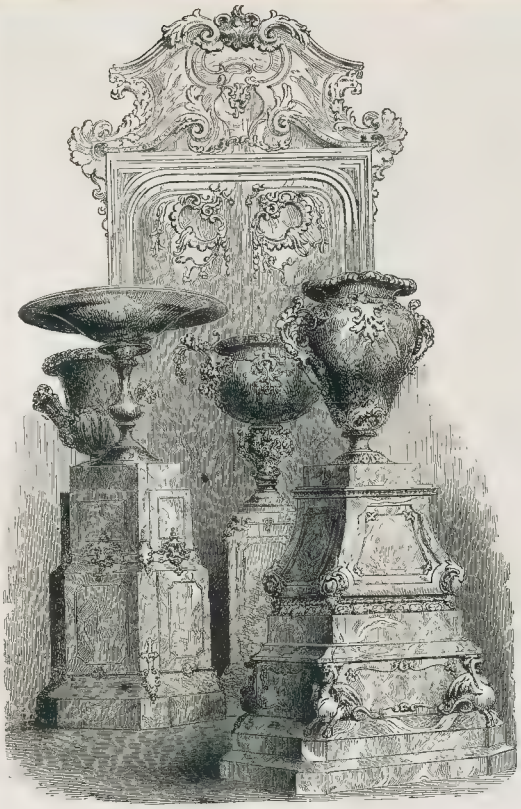
PORCELAIN CANDELABRUM. BY LAHOCHE.

Lahoche, of the Palais National, has a very fine display of porcelain and crystal, in dinner services, clocks, vases, lamps, &c. That which we have engraved is a handsome lamp or candelabrum in porcelain, and or moulu. The designs upon the former are painted in rich colours, upon a pale blue foundation.

PORCELAIN CANDELABRUM —BY LAHOCHE.

MALACHITE DOOR AND VASES FROM RUSSIA.

The magnificent and unique productions in malachite, exhibited by the Demidoff family, are justly objects of great admiration in the Russian Court. The labour involved in their production must have been immense, malachite being a mineral found only in small pieces, which have to be joined together by a peculiar process to form such works as those before us. The doors are of stately size, highly polished, and enriched with or moulu. The vases are all of different forms, each very beautiful, and are also embellished with or moulu.



MALACHITE DOOR AND VASES.—FROM RUSSIA.

FISH-KNIFE, FORK, AND SPOON. BY LISTER AND SONS.

The fish-knife and fork are very happy and effective in design: the handles are of ivory, richly carved. The spoon is of a scroll pattern, very neat, and appropriate for general use.

FISH-KNIFE, FORK, AND SPOON.—BY LISTER AND SONS.

DIAMOND AND RUBY STOMACHER. MOREL.

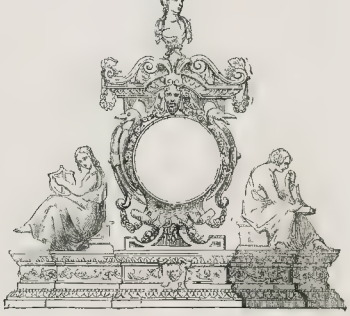
Here we have one of the gems and glories of the Exhibition, which fairly rivals in attraction the Queen of Spain's jewels and the "Koh-i-noor" itself; a truly sumptuous production, upon which the jewellery trade of England might be bold to stake its reputation in face of the world. It was originally intended and destined as a bouquet, but is equally, perhaps more appropriately, available as a stomacher; moreover, it is so constructed as to separate into several distinct pieces of jewellery, according to requirement. The diamonds are all of the finest water; and the rubies are described as "an unique collection." The setting is contrived with springs, resulting in a waving or slightly oscillating motion when in use, which displays, to the fullest extent, the brilliant colours of the stones.

DIAMOND AND RUBY STOMACHER.—BY MOREL.

FLOWER-STAND AND CLOCK-CASE. BY POTTS.

These are two very happy specimens of the brass manufactures of Potts, of Birmingham. There is not much pretence at originality in the design, but the manner in which they have been turned out is unexceptionably meritorious.

FLOWER-STAND.—BY POTTS.



CLOCK CASE. BY POTTS.

WATKINS' AND HILL'S MODELS OF STEAM-ENGINES.

The sectional models of steam-engines contributed to the Machinery Department of the Great Exhibition, by Messrs. Watkins and Hill, should be examined by all who are unacquainted with the workings of the steam-engine, before they inspect the numerous machines in motion which are actuated by the power of steam.

By these illustrative sectional models all the internal actions of the different kinds of engines represented are clearly shown; but it is much to be regretted that these models are not rendered more useful by the attendance of a mechanical person appointed by the Royal Commissioners, in order to afford the necessary explanations to the thousands of inquiring visitors, very many of whom enter these sultry regions, exposing themselves for a long period together to a sort of shampooing process, for the express purpose of gaining knowledge with regard to a subject which is but little understood by the great masses of the people.

The first of this series of models is of a condensing steam-engine, motion to which is given by a pulley-line from one of the neighbouring engines. This model is chiefly constructed of brass, and is a piece of finished workmanship; on one side the exterior of the machine is shown, while on the other the interior is clearly laid open to view, with the action of the pistons, clacks, and valves, air-pump, condenser, &c.

The second model is chiefly of wood, painted, and represents in *elevation* and longitudinal *section* a six-wheel locomotive engine of ordinary construction, in which the furnace, tubes, cylinders, cranks, smoke-box, blast-pipe, &c., are distinctly shown.

The third model represents a beam marine steam-engine; and the fourth, which is of smaller size, shows not only a condensing steam-engine complete in all its parts, but also the furnace and boiler, in which latter the steam is generated.

PORCELAIN, EARTHENWARE, &c.

THIS important branch of industrial art is one which cannot have failed to prove of great interest in a marked degree to those who have already visited the Great Exhibition; and to those who have yet to realise this almost universal desire, it cannot fail to prove a leading feature of attraction; for whether we look at the results in an artistic, industrial, or utilitarian point of view, we find its interest to be precisely the same, since all are combined in an eminent manner in the various departments into which the china, porcelain, and earthenware trades are subdivided, and in no other branch of our national industry is the value of industrial, scientific, and artistic operations so marked in relation to the materials to be acted upon by the skill of the worker. A portion of clay, the value of which may be the smallest fraction of our smallest coin, is, by the skill of the potter, converted into vessels for use or ornament, and almost with the rapidity of thought the plastic material is raised under the ready fingers of the potter into an article of beauty and utility. Chemistry lends its aid in colouring and vitrifying the form which the simplest mechanism has produced, and art gives expression to that colouring in the due distribution of tints, or in the arrangement of the forms in which they shall appear. This, too, takes place in the finest specimen of porcelain, as in the humblest example of earthenware; and the two extremes meet in this identity, so far as the leading features are concerned, of the operations by which they are produced.

There are few things more interesting than the tracing up through the centuries the progress of the art of pottery; for, when textile and even metallic manufactures have perished by time and exposure, the fictile remains of bygone ages have been preserved to us, and, in many instances, have proved of eminent value as records of the habits, costumes, and ceremonies of peoples long since passed away. The material, from its earthy character, has served to resist the action of ordinary decay, and give to modern times pictures of those things of which all other record was completely lost. Nineveh, Egypt, Etruria, and ancient Rome have come down to us all the more lavishly in their fictile remains, however much their architectural monuments may have enabled us to confirm the facts of written history or tradition; since, in every age, an advanced stage of civilisation would appear to have been evidenced by a high condition of the fictile art. Varying in purpose, in style, and method of production, in decoration and general effect, these remains of antiquity always convey to the thoughtful observer a strong individual perception of the genius of the country and age in which they were produced. It was, however, reserved in this, as in other departments of industry, for the skill and invention of modern times to render this art subservient to the wants and comforts of the masses of the people; and the immense commercial development given to the manufacture of porcelain and earthenware is one of those manifestations of industrial progress which the social wants of an age like the present could alone bring forth. No longer confined to the exclusive purpose of sacrificial ceremonies or monumental records, these fictile arts have become the agents of domestic comfort in their uses, and of intellectual refinement in the beautiful forms in which they come before us; and, with due care and attention on the part of those in whose hands the manufacture and distribution of these examples of modern skill are placed, they may become, to a far greater extent than at present, the means of a wide-spread education in those arts, which all are agreed tend to the ultimate elevation of human character. Nor can the numerous inventions and adaptations of even the commonest earthenware vessels to the purposes and requirements of society be overlooked, as tending to produce domestic habits of cleanliness and order, where, but for the economic uses to which modern ingenuity is ever seeking to adapt its productions, discomfort and the banefal influences of a neglect of the simplest sanatory laws would obtain. It is, therefore, under the two aspects of use and decoration, that we desire to look at the illustrations of the present position of china, porcelain, and earthenware manufacture, as evidenced in the display before us.

Here, then, we have placed for examination and even for comparison the productions of the Royal porcelain manufactories of Sèvres, Mereich, and Meissen, on the one hand, as the exponents of the highest manifestations of skill in fictile design, of which modern means are capable; and, on the other hand, the results of private enterprise and the persevering energy of the British manufacturer, in seeking to supply those wants and meet the tastes of the masses of the people; as displayed by the production of the Staffordshire Potteries, of Worcester, and other localities in which these branches of industry are carried on. There were few points in connexion with the early progress of this manufacture, which created more distrust on the part of our manufacturers than the uncertainty as to how far these Royal or Government manufactures on the Continent would be permitted to stand in competition with the results of the private enterprise of our own manufacturers, as regards the honours to be awarded to those whose works appeared to call for suitable recognition; inasmuch as the injustice, and, indeed, the absurdity, of placing for comparison articles made for the markets of the world, with those which pretending works of art was the only aim, let the cost, in time or money, be what it might, was obvious. In fact, our manufacturers justly felt that there was, in reality, no point of comparison to which, in common sense and justice, they could afford to submit. The difficulty, however, was got over by the decision of the Royal Commission, that the industrial results of the porcelain manufacturers of England could in nowise be placed in the same category with the fine art works of an establishment supported by the respective states of the Continent, not so much for industrial purposes, but as a means of example and refinement in the taste of the people.

THE STAFFORDSHIRE POTTERIES.

This important district first claims our attention, because it is at once the exponent of some of the highest manifestations of china manufacture, as of the more common earthenware produced for the ordinary wants of everyday life. The tables of the palace and the cottage are at once furnished from this, one of the most interesting localities, in an industrial point of view, to be found in the world; and, when it is considered that the greater portion of the development to which the various branches of the pottery art has attained, has taken place almost within the memory of living persons; that new processes and fresh powers are, as usual, a new impetus to almost every department; that artistic taste and skill, which was formerly the rare exception as in the case of Wedgwood, has now become, in a great degree, the rule of action, although the full realisation of this may be far from complete, as we see here, as elsewhere, when carefully considering our manufacturing systems, that in every pursuit the Saxon mind has but to receive the necessary momentum at the right point, and the problem, whatever it may be, is at once in progress of solution.

To those who carefully examined and noticed the condition of the Staffordshire potteries some fifteen years ago, and saw how little improvement had been made since Wedgewood's time, and how much had to be done without any very apparent means of doing it, since the workers had much to learn and no one to teach, it must be a source of astonishment and satisfaction to find that so great a progress has been made, and, being now fairly begun, must of necessity go forward. The introduction of the comparatively new material of Parian for statuettes and ornaments generally, has given a feeling of art to those productions which the old bisque body never could have done. The rich transparent tone of the Parian, giving the reflected light and semi-opaque shadows of its contrasts so unmistakably with the grey-looking tint and hard effect of the bisque, that no one can wonder that the latter is now completely superseded in England, for all works in the Fine Art department of the porcelain manufacture. We trust, however, that the manufacturers will not allow themselves to run wild in this material, of which there are many symptoms in the Exhibition, but keep steadily to those articles and subjects which, in size, style, and method of treatment, will enable them to do full justice to themselves, and the beautiful medium now placed at their disposal.

The introduction of Parian into general use for the objects to the representation of which up to the present time it has been so successfully directed, is chiefly due to the two enterprising firms of Messrs. Copeland and Messrs. H. Minton and Co., of Stoke-upon-Trent; but we have good authority for saying that the former firm was the first to solve the problem of its applicability under judicious treatment; not that in this respect Messrs. Minton's claim is one whit the less for the skill, talent, and enterprise with which, from the beginning they entered into the race for excellence; and in all the examples shown by these two houses we have the result of the great amount of experience, artistic knowledge, and manufacturing tact which their great past experience has given them. In Messrs. Minton's display of Parian there is little left for the most fastidious to wish; and, in spite of our desire to see the application of it kept within those legitimate bounds as to size and use, to which its character best fits it, we are compelled to admire the beauty of the *Renaissance* chimney-piece, because the design has been so thoroughly adapted in all its parts to the requirements of the material. The caryatides are spirited and expressive, the ornaments appropriate and graceful, and the whole well fitted together. The painted porcelain panels, too, add to the effect in no mean degree. On the shelf of this chimney-piece are three novelties in statuettes. The Flora is rather overstrained in pose, though there are excellent points; and of the pair of the Amazon and the Warrior, we are inclined somewhat to question the taste of the former, though the execution and spirit are very admirable. In both there is a considerable amount of energy and power.

A wine-cooler, decorated with cleverly designed incidents of the chase, in which the animals are modelled with great accuracy, the figures of the contending sportsmen, or boys *en costume*, being very spirited, is an excellent example. The vine, as festooned around the whole, is charmingly executed, and the crowning group of figures, with an emblematic barrel of bacchanalian dimensions, is original and pleasing. The heads of the boar and fox are very finely executed. There is a second example of this piece, in which gilding is employed as a means of decorating certain salient points, but to our mind the Parian in all its integrity is the best. Another work in Parian is a centre-piece, with fine emblematic figures of the seasons, very beautifully treated, the figures being well designed and modelled, the pose of the "Winter" being very grand, and the treatment broad. In colour, the light blue, gold, and Parian produce a most harmonious result. Another example is a jelly and ice stand, very tastefully arranged, the group on the top, with the scrambling little figure eager to seize upon that which is far out of reach, very pretty. The floral ornamentation too, of the cups, &c., is exceedingly well painted, being neat, broad, and effective. The centre-piece, or dessert stand, with the two reclining figures in eastern costume, we do not like. It is neither in good taste nor of any real intention being visible. Another, however, with three genii at its angles, is very good. These figures are beautifully modelled, the leading features of the colour and gilding being the same as those we mentioned above as being so chaste in effect.

In statuettes, the reduced copy of Power's "Greek Slave" deserves marked attention for the excellent manner in which the expression and sentiment of the original has been preserved. This, however, is only one out of many which either have been or are destined to be very popular. "The Babes in the Wood," after John Bell, and a statuette of the late Sir Robert Peel, are excellent points, though widely differing; and a group of Cupids with a goat, or rather two treatments of the same subject, forming a pair, are remarkable for excellence of drawing, modelling, and the florid character of the treatment.

Minton's china has ever been esteemed for its tasteful colouring, and the treatment of the smaller floral subjects; and on this occasion the reputation of the house has been duly sustained.

In dinner services, the plates are of an excellent character, the execution of the painting being at once delicate and effective, and without any overstrained attempt after neatness: that quality is obtained in a satisfactory manner. The centres, too, are usually sufficiently subordinate to the border, a point which ought to be laid down as a principle in the decoration of a plate. In tea and breakfast services the cups and saucers are generally very elegant in effect.

With the exception of the two large vases standing on each side of the Parian chimney-piece, we cannot admire the vases or scent jars of this house; for there is a want of form in most of them, which, in spite of beauty of colour and manipulation in painting, gives them an unsatisfactory appearance. The large vases, however, are an exception; the forms being bold, clear, and well pronounced, and the decorations simply part of the general form. The metal casting and chasing of the handles, too, strike at once, and the effect of the whole is satisfactory for such large objects.

In the less costly articles, Messrs. Minton make a very interesting display, and some of the articles for the toilet are very elegant. The new process by which lithographic printing is brought to bear in the coloured decoration of earthenware, is here illustrated in two excellent examples, one being coloured with blue only, the other red, and light, and shadow being well given; the other being a composition of the bryony, very nicely rendered as an ornament. On the whole, this exposition of Messrs. Minton's current productions is a most satisfactory and interesting one.

In Mr. Alderman Copeland's (2) display, Parian is again in the ascendant, and certainly its rich and delicate tone contrasts well in the overwhelming light in which the china, &c. is placed. Of this light the exhibitors have some right to complain, inasmuch as attempted to overcome the difficulty by having glass cases, but we think this rather aggravates the evil. Both Minton and Copeland have avoided this, and displayed their wares in all their integrity, and certainly, under all circumstances, to every advantage. The Parian statuette of "Sappho," from the original by Theed, in the possession of Her Royal Highness Prince Albert, strikes from its size, being probably the largest figure yet produced in the material; but for that very reason we think it is not to be overlaid with the higher class statuettes, out of the forty examples exhibited by this house. The hands and feet seem out of proportion to the head. This may be a fault of the original, but it is quite as likely to arise from, or be exaggerated by, unequal firing, which we think a fatal objection to attempting large works of th skind. Under any circumstances, the shrinkage of a material such as "clay" is in this respect as Parian, is likely to be more regular in a statuette of sixteen inches high than in one of thirty-five inches; for when it is remembered that this shrinkage invariably reaches one-sixth, the calculation of this fairly accomplish a thoroughly good work, even when small, is no indifferent item in the skill employed in producing the result. The "Ino and Bacchus" of Foley has been admirably reduced, and, with an appropriate pedestal, stands out with peculiar grace and finness. This is a beautiful subject for the crowning ornament of a decorated clock, and, with suitable bronze adjuncts, would look even better than it does as a single work. The "Dancing Girl reposing," by Marshall, is very charming; and the head of a young boy, gracing the "Last Supper"—the taste of the work—from a drinking vessel, is admirable. The lower extremities of the figure, however, have a "wooden" look. Durham's elegant bust of "Jenny Lind" is, to our minds, the best in Parian yet published. Many of the other examples are well known, and require no remarks, by occasional illustrations either from the originals or from the Parian reductions. Probably the greatest novelty, certainly in the Parian, is the "Tripod Flower-stand." The design is classic and appropriate: it is beautifully modelled, and the difficulty of uniting the parts has been well got over. The example in terra cotta is also very meritorious.

The slabs for fireplaces are very noticeable features in Copeland's examples, the greater portion of them being excellent in style and execution. Those in which the work is painted at the top, from which it is suspended an arrangement of the convolvulus in one slab, and the passion-flower in another, are very complete and appropriate. The painting of the flowers is broad in handling, and artistic in colour and effect. Indeed, these modes of treatment characterises all the works of this house, whether dinner, tea, or coffee services; the latter being always broad and effective, the cups and saucers neat, and with the same quality in an appropriate degree. Several table-tops are worked up in this style with remarkable success.

In toilet slabs, the Etruscan style of ornament is brought in very successfully, and the effect of mosaic-work well given. The size of the slabs, and their truth of surface, is remarkable. Of vases there are a great number, many very chaste and elegant, others a little over-done in the details of decoration. The leading forms are classic, and modern modes of ornamentation have been resorted to. The painting in some of them is very excellent, in others not so good. Those decorated with landscapes, cleverly as the landscapes are executed, are contradictions to all the laws of perspective, for during this display is rich and effective, and a tint, which has been named the "Queen's colour"—a pearly violet tint—comes as a grateful variety to the everlasting blues and crimsons.

In the commoner ware there are many excellent specimens of dinner pieces. The plain printed ware in new colours, and in an equally novel, because very bold and artistic style of engraving, will bear careful examination. One plate, with an Etruscan border of excellent design, is, however, spoiled by a commonplace landscape subject, which good engraving could not redeem, being placed in the centre. If this were replaced with an appropriate patera of the style of the border, it would be the most perfect plate of its kind we have ever seen.

Messrs. John Ridgway and Co., of Cauldron-place, Shelton (3), afford an agreeable contrast to their neighbours by exhibiting no Parian, and contenting themselves with a first-rate display of the utilities of the pottery trade, more especially as applied to sanitary purposes. Their pottery "fountain hand-basons," in a variety of forms, give evidence of a close attention to the special want they are intended to supply; and whilst doing this, care has been taken that the wealthy can have any amount of elegance and decoration which taste or caprice may suggest, whilst the purchaser of humbler means and aspirations may have those useful articles which his requirements may render necessary, at the most moderate cost. More cleanly, useful vessels it is impossible to conceive, whilst there has been much care and consideration bestowed upon their appearance, as decorative adjuncts in a chamber.

Mr. Bridgwood also exhibits a stair-rail in earthenware. The gilding is somewhat out of taste, being carried a little too far; but, in many points, it is suggestive of beauty in similar adaptations. This over ornamentation is a point we shall have constantly to find fault with in this department of industry, for our porcelain manufacturers seem to think they can never, by any possibility, do too much. In the examples of dinner-services, for instance, in the contribution under consideration, the plates are overloaded with painting and gilding; the former being hard in handling, and indifferent in drawing. The plain and gilded articles are effective and satisfactory—one soup-tureen being very excellent. The conservatory fountains are objects of some pretension, and in many respects are well adapted to their purpose. There is a light and brilliant appearance, which in the midst of flowers and foliage would give them a peculiar value they cannot possibly have in their present isolated position.

The name of the exhibitor whose contribution next demands attention is one which every lover of art or art-manufacture must reverence, and it is something to have it associated with a production like the present. We allude to Messrs. Wedgewood and Sons, of Etruria. The exposition here made in many of the departments in which they were formerly celebrated, and for the perfecting of which they carried the names of Flaxman and Denman into the service of the potter, is not in an equal manner with the rest of the great subject; but we expected less than we expected, for we have here the blue jasper vases, and cameos with white bas-reliefs from the antique, in all their excellence, and a copy of the Barberini vase, with specimens of Queen's ware, the chessmen by Flaxman, and efforts in "Carrara porcelain statuary," or Parian, all show that the old spirit is "not dead but sleeping," and that the Great Exhibition has awakened those energies and aspirations which have been so long slumbering; for we find here examples which have been suffered to almost sink into oblivion from sheer neglect and apathy, and yet how well they look in the broad daylight of the Crystal Palace. The specimens of black ware, or jet, are very excellent, and the old terra cotta with black figures are complete revivals of the olden type. Nor must the chemical vessels be forgotten, since their quality is no mean test of the present skill of the house. In short, as a whole, whose who honour the name of Wedgewood will feel tolerably well satisfied with this proof of the vitality of the firm

Messrs. S. Alcock and Co. (7), of Burslem, exhibit a high class of printed ware, of excellent quality; the plates being especially good, and the cups and saucers pretty in style and chaste in colour. The painted plates are, however, heavy in manner, and the flowers inartistic in execution. The specimens of Parian are extravagant in subject; the relief, as in the sportsman's jug, being too high for artistic effect. The "Cod-fish Cigar-ash Holder," by Alfred Crowquill, is very clever in its way, and some of the more classical of the Parian examples are pretty.

J. Clementson (8), of Shelton, has some excellent examples of printed ware; the landscape engravings being artistic and well-selected, according to the prevailing mode, which, of course, the manufacturer is obliged to follow. In addition to these, we have Parian examples again; and Messrs. T. J. and J. Mayer, of Longton (9), show this material, or bisque, wrought into such clever imitations of flowers as to be quite ridiculous, and to us it appears a sad waste of time and material. The toilet vessels exhibited by them are of the same description, and excellent in quality and colour. The rustic jugs, however, are more curious than artistic or beautiful. The specimens of colour-printing, as shown in labels for advertising, are effective, and susceptible of further development.

Messrs. Naigh and Sons, of Hanley (10), exhibit china in great variety, but of very unequal execution. The examples of two dinner services are rich and effective. Amongst their specimens of Parian, a bacchanalian vase is very clever in many points, some of the *reliefs* being well modelled; a clock, too, in Parian, is very suggestive. The vases, with portraits of the Queen and Prince Albert, with views of the exterior and interior of the Crystal Palace, are clumsy in outline. The clock, as suggestive of domestic comfort, might have been wrought out to a better purpose. Some of the other articles are very pretty and effective.

Messrs. T. and R. Boote, of Burslem, exhibit a Brobdingnagian Portland vase of such dimensions as would almost bid defiance to any breaking propensities which might develope itself by any association of ideas arising out of the attempted destruction of the Great Bear. The remainder of the contribution of this firm is of more useful articles, the best of which are some very excellent jugs for "toddy" or hot water.

Messrs. Ashter, Boyne, and Hope (15), of Burslem, make a pretty display, in which there are some good examples of printed ware. Messrs. Anderson and Bettley (16), of Longton, show specimens of cups and saucers, &c. intended for Italy and the East. The white examples are very clear, and the decoration of the more elaborate one elegant and effective. The examples of plates, too, are very good as a whole.

Messrs. J. and H. Pratt and Co. (22), of Fenton, make a rather remarkable display of examples in colour-printing, in which portraits are well given on a variety of articles, such as scent-jars, dessert pieces, &c. One large plate is decorated with an engraving in the style from Warren's picture of "Christ and his disciples in the corn-field on the Sabbath-day;" and it is certainly an admirable example of its class, the effect of the whole being very artistic. The imitations of the Etruscan vases in red and black are also worthy of notice, and the plain printed articles generally are of superior quality. Similar examples, exhibited by Messrs. Serjeant and Popper (19), of Hanley, are also very good. One plate, with a vine border, is very excellent.

Messrs. Mayer and Elkington (20) show a considerable collection of Parian examples, some of which are also exhibited by other houses, and others are only to be found here. They do not call for any special attention from us, though of interest to the visitor, or those who desire to see the extent to which the new material is now carried. The copy of the "Warwick vase," exhibited by Messrs. James Edwards and Son, of Dale Hall, Brualem, is a prettier example

We cannot conclude our notice of the contributions from the Staffordshire potteries without calling attention to the very admirable display of door furniture in china, by Mr. W. B. Simpson, of Burslem. Thus, we have finger-plates, door-handles, paterae for bell-pulls, &c., many of them very excellent in design and execution, and of all styles and colours. Some bold and very cleverly reduced model of the classic bust usually known as "Clytie," executed in terra cotta, and exhibited by James Marsh (51), of Longport, be overlooked; and still less the wine-cooler, also in terra cotta, by the same youth, who is, we understand, a pupil of the Potteries School of Design, in which institution these works were executed. The latter example is clever in design, and the chimerae are spiritedly modelled.

On the whole, this display is far superior to what might have been expected.

WORCESTER.

The exposition of the porcelain trade of Worcester is now confined to two houses, and the examples of Messrs. Chamberlain and Co. are by no means so novel as for the reputation of their ware could be desired. Excellent as many of the examples certainly are, still it would have been more satisfactory to have seen full and complete evidence of present operations, rather than so great a reliance on that which this house did years ago. As a whole, the display is an interesting one. The vases are generally good examples of their class; and the one on which the subject of "Cardinal Wolsey received at the Abbey Gates, Leicester," is displayed is a valuable specimen of the talent of one of the founders of this house, Mr. H. Chamberlain, and the execution is very creditable in the fine. The painting is a first-rate example of its class. In general the articles are over decorated, and the stippling carried to a painful extent. Some of the landscapes are pretty and effective. The "honeycomb" examples are very rich in effect, and in the enamelling vessels are got up with great care; but, unfortunately, the subject-pieces with which they are decorated are badly drawn. The same may be said of the supporters to the arms upon the dinner-service executed for Lord Ward. The border, and, indeed, the effect of the whole, is very excellent, the blue being splendid in tone, and, but for the inaccuracy alluded to, the work would be almost perfect. Some of the less decorated articles are very elegant.

Messrs. G. Grainger and Co. exhibit specimens of their semi-porcelain, a new material, to which they have paid great attention, and with marked success. For chemical purposes it is of the greatest value, as it

resists the action of fire and acids. For general purposes its decoration is, of course, subject to the same laws as other materials; and in the examples before us, with much to satisfy, there is much to find fault with. The examples of tea-services are very pretty, and the less decorated of the plates are very excellent; the flowers, however, are generally very badly drawn, and the painting inartistic and wanting in relief. The Worcester manufacturers should attend to these points.

COALBROOK DALE.

Messrs. John Rose and Co. (47), of Coalport, make, on the whole, a very satisfactory display; but the remarks we have made as to the want of accurate artistic knowledge in carrying out details as seen in the Worcester china, are applicable in this case too. With an amount of labour of an almost fearful character, there is little real artistic result; yet no one can doubt the effort, and wonder that the same house which could carry out the very beautiful examples of a less ambitious character to be found in this collection, could have wrought out the other. Nothing can possibly be more satisfactory, or more magnificent in appearance, than some of the specimens of dinner services placed at the back of the case. Those blue and gold are very beautiful. Then the Rose Dubarry service, to which we shall again allude, is everything in colour which the most fastidious could desire. Indeed, the colouring, generally, is excellent, except where, by overstippling, blackness has been the result. Some of the examples of tea services are very charming—and those with blue and gold interlaced ornament are perfect of their kind. The dessert pieces are, however, too much overloaded with detail, and want more simplicity of taste

In Parian, a great effort has been made by this house in getting up probably the largest group yet executed in this material. As already indicated we doubt the policy of attempting these large examples; and giving Messrs. Rose full credit for the attempt, cannot think it has been so successful as perhaps it deserved to be. The sentiment of the group which represents the "Pleiades adoring Night" is unexceptionable, and the treatment elegant, but the draperies want breadth, and the base of stars is by no means what it ought to be. The large group of "Puck and his Companions" is fanciful, but too large. "The Wrestlers" is really very well executed.

In connexion with Messrs. Rose, we may instance the display of Messrs. A. B. and R. P. Daniel, of 129, New Bond-street. Here we see the Rose Pulsary dessert service in all its glory, the distinctive feature being its peculiar tint, which was first introduced at Sèvres in the reign of Louis XV., and named after his mistress. There is great beauty, softness, and richness of tone, the colour being at once very regular and semi-transparent. The effect is very beautiful. In Messrs. Daniel's case we find a very superb service in white and gold, which proves the capabilities of the manufacturer; and if we object to the decoration as being carried too far, it is because the knowledge where to leave off is a point to which the attention of our manufacturers requires to be directed. The parian ewer exhibited in this case is a mistake. Before quitting these examples we cannot but express our regret that both Messrs Rose and Messrs. Daniel should have marred their display by glass cases, which for this class of articles, and in such a light, appears very objectionable, as it shows their examples to a disadvantage.

LONDON.

Messrs. T. and M. S. Brown, 47, St. Martin's-lane, make a very pretty display. The printed examples are very good, but there is too much of the "shop" in mixing the china, &c. with glass. The method of showing the Portland Vase, which is so mounted that the design upon the bottom is seen, is very good. There are other exhibitors, to whom, had space permitted, we desired to call attention, but cannot do so now. We must not, however, fail to do justice to the very admirable display of patent stoneware china made by Mr. C. Mason, of Langton, and which ought to have been alluded to in connexion with the Staffordshire Potteries. If the Chinese type is the true one for this class of manufacture, then is Mr. Mason's exposition a perfect one, for it is sufficiently Chinese for the most fastidious of Celestials. vases, semi-jars, garden-seats, &c. in which dragons of sufficient ugliness, and gilding and colours of painful brightness, are all brought together in glorious but orderly confusion; and the whole group is one of interest to the admirers of this peculiar school of decoration.

We had intended to conclude these notices with some general comparisons between this display and that on the Foreign side, but must postpone them until our notice of the productions from the Continent

THE CONTRIBUTIONS OF RUSSIA.

THE accident that has placed the produce of Russia next to that of the United States is curious and suggestive. The greatest empire next to the greatest republic—pure despotism side with perfect self-government, vigorous private enterprise compared with the results of Royal patronage; yet there are strong points of resemblance between the two countries. Barely 160 years have elapsed since Peter the Great, while commencing the task of Europeanising and civilising Russia, worked by day in the shipyards of Deptford, relaxed by driving a wheelbarrow through Evelyn's beautiful holly hedge at Sayes Court (a hedge still in existence), and sat up at night drinking brandy and pepper with the Marquis of Caermarthen. But sixty-eight years have passed away since Benjamin Franklin, dressed in the brown suit in which Wedderburne had abused him as a rebel, attended as Minister Plenipotentiary from the United States to sign the treaty of peace by which Great Britain acknowledged the independence of the Republic. Both have made rapid strides in that brief period. Both have invited immigration. The Russians on plan, rule, and system; the Americans by free liberty to labour and great chances of independence. Both have still huge tracts of land to be cultivated. Both are rich in raw produce and natural wealth. But the progress of Russia depends almost on one irresponsible man. The progress of the United States depends on the continued vigour of a nation which so far has proved itself equal to every opportunity. The Russian confides in his emperor; the "Statesman" depends on himself. The American people have made the United States the great nation it is. But no man of observation can doubt that it has been the hard hand of despotism which has raised the Russian empire from the condition of semi-barbarism in which it existed in the time of our William III.

The Russian exhibition consists of two compartments of a totally different character. In the North side of the Nave are to be found rich green malachite vases, the produce of the imperial manufactories. Some of these works are of extraordinary magnificence, particularly the green jasper or malachite doors, the chimney-piece and stove. There are also several gigantic vases of painted china made after the fashion of Sèvres, tapestry carpets of great magnificence, jewellery as splendid as gems can be made under the hands of a Parisian workman, particularly a box on which the natural colours of purple grapes, peaches, and other fruits have been imitated in precious stones. By the side of the jasper vases lie lumps of the raw material, some as large as a foot-ball. The whole of this collection, with which a few weapons of war are intermixed, composes a brilliant museum of what may be termed *Royal toys*, in contrast to the spades and axes which compose the *Sheffield steel toys* of Birmingham. They are not made for profit or the subject of any export trade. It is part of the Emperor's State, in the same way that he has tall horse-guards and footguards, to have certain imperial manufactories where porcelain, jasper vases, and tapestry carpets are manufactured, without regard to expense, either to adorn the imperial palaces or to be presented to his friends and allies.

On the same principle we find that the Emperor has lately sent young men to Rome, to become pupils of the most eminent artist in mosaic, with the view of founding a manufactory of mosaic in St. Petersburg.

It is understood that the porcelain manufactory is under the direction of Frenchmen; and although the Russians have shown great talent in making external copies of various works, they do not as yet much understand the meaning of honest workmanship in articles that require exactness of fit. Indeed, in St. Petersburg almost all work of fine art or taste is in the hands or under the direction of foreigners. The malachite vases are not, as they would at first sight appear, solid, but veneered, as it were, on copper. The expense of their construction is very much increased, when, as in the instance of the splendid specimens exhibited, it is determined to complete every wave and shade of the vein, for then it becomes almost as difficult a work as mosaic.

The malachite is found in the copper mines in which Russia is so rich; some of the finest specimens have been obtained on the property of the Prince Demidoff. It has also been found in considerable quantities in the Burra Burra mines of South Australia, and hence lately come into fashion for colonial brooches and bracelets.

Almost all the articles exhibited in this Northern Bay are the produce of a system, almost universal among the monarchies of Europe, of carrying on Royal or National manufactories, as a matter of luxury and as an example of taste. Such in France are the national manufactories of Gobelins tapestry, of Beauvais carpets, and Sèvres china; in Prussia, of iron-casting and porcelain; in Saxony, of porcelain; and in Tuscany, of mosaic in *pietra dura*. To several of these establishments, particularly in Russia, and in the Gobelins establishment in France, schools for instruction in drawing and painting as applied to manufactures are attached for the benefit and due training of workmen. In England, it is with difficulty that money is obtained for schools of design; but although we wisely rely on private enterprise for manufacturing excellence, it would pay us to devote more money to cultivate taste.

Russian Carriages.—On leaving the splendid department dedicated to luxury and fine arts, we find in the small avenue to the north some more real and utilitarian specimens of Russian industry, in a set of very handsome carriages, of a peculiar national form. These are called Russ droshky, equally available on wheels, or in the winter on runners, and the favourite carriage of Russian gentlemen. They are on four wheels, very low, with a strong iron forked perch, and a double body, the first of which either holds one or two persons abreast. There are specimens of both kinds: the other merely holds a seat for the driver, who sits close upon his horse or horses; when a pair are used, the correct thing is for a shaft-horse to trot, while the second, harnessed to an outrigger, gambols at a canter beside him.

It will be necessary to give an illustration in order to afford a correct idea of the shape of these vehicles. They are very stylish, but suited to a military nation. They allow of no lounging; the passenger must sit as upright as though he were driving himself in a dog-cart. It is not considered correct for ladies to be seen in them in large towns, but of course they are occasionally used in the country. With a little lowering of the seat, they might be copied with advantage here, and would prove a pretty novelty. The workmanship deserves unqualified praise, except the shafts, which are heavy and clumsy. The leather splash-boards round the wheels are particularly well arranged—no stitching appears, and they look like pieces of solid japan; the lining and the varnishing are equally well finished. If the wood is sound and well seasoned, they are not dear at the price set upon them.—*£47*. A set of harness hangs up in the large room, which is also of a fashion peculiar to Russia. We should recommend the obliging Russian Commissioner to procure a wooden horse, so as to exhibit one of the turn-outs complete. It is difficult to explain, to those who have never seen them in use, the arrangement of a great birchwood bow, which is an indispensable ornament of Russian harness, and from which bells are suspended over the horse's neck. Close to the carriages are a pair of very light sledges of iron; these harnessed to horses are used for running races on the ice of the Neva in winter, and awful cockleshells they seem to go any pace. The driver sits on a low bench with no support to his back. Steeple-chasing must be child's play compared with such sport.

Crossing the main avenue to the South Bay we enter the compartment in which the staples which constitute the export trade of Russia, with several curiosities, are arranged. These are important almost in proportion as they are unattractive: one part of the walls is hung with leather, including choice specimens of the "Russia" dear to book collectors. On the counter, with many pairs of boots and shoes, is some of no particular notice, being neither better nor worse than French German, or English, are a pair of dress-boots, made of the thinnest and best calf leather we ever remember to have seen. It is as soft and flexible as kid, but stronger. We are informed that the material is much used in Russia for full dress boots If it can be delivered here at a reasonable price, a large demand is certain. All the leather exhibited is well tanned, soft, and a good colour.

Russian Felting.—On the same counter as the leather are a number of stockings, shoes, and other articles made of felt by the Russian peasantry A very curious manufacture indeed, well worth the examination of the trade. Each article seems felted separately, and made solid yet soft. The shoes are regular sabots, two inches to three inches thick in the sole, apparently moulded on a last, strong enough to resist the cut of a sword or even a bullet, and yet soft and warm inside. For travelling in winter they are invaluable. But this mode of felting is evidently adaptable to many other purposes. On the opposite table are basins, jugs, cups, helmets of the same material japanned inside and out. They are light, tough, and not to be broken. A washhand jug and basin are rather dear (17s.), but they would be famous articles for sea voyages—Gutta percha has been tried for that purpose, but it melts in tropical climates. We advise our outfitters to look to this.

Provisions.—A trophy of sheafs of seed-bearing agricultural produce, very elegantly arranged, containing every kind of wheat, barley, oats, rye, buckwheat, flax, hemp, peas, and beans grown in the Russian domain, occupies the centre of a counter, round which are large wood bowls the seed and flour of these articles. Among them our cooks may find it worth while to try a small kind of dried pea for winter use, in soups, of a very sweet taste. On the walls around are specimens of the famous Russian hemps, raw and manufactured, with canvass and ropes and twine, which, with grain and tallow, are too well known to our merchants for this last hundred years to need further notice.

Dried Provisions.—In the same department is an extensive collection of dried provisions, including *caviare*, dried sturgeon, isinglass, a substance resembling isinglass made up in the shape of a rude whip which is obtained from a fish called the *Vesigo*, and used in Russia to make pies; but, perhaps, the article most likely to become a new staple of commerce is the *glaze*, now imported, as we are informed, for the first time. This article, so much used in this country for making sauces and soups in clubs, hotels, and great houses, is obtained in Russia by boiling down the flesh of horned cattle, which, on the plains of the interior, are valuable for their hides and tallow. Anything that can be made out of concentrated meat or glaze is so much additional profit. But it is an operation which requires care—a little burning will spoil the whole boiling. Liebig gives directions for the operation in his last work: as commonly conducted, the product affords very little nourishment.

Iron and Steel.—In the avenue behind the bay just described, the specimens of iron and copper, in ore and in a manufactured state, are displayed. The iron, some of which is of a very fine quality, is a matter of interest to us, because Russia, in conjunction with Spain and Sweden, supplied most of the iron consumed in this country for more than 100 years, between the time that the timber for charcoal in Surrey, Sussex, Kent, Staffordshire, and Worcestershire, was exhausted, and the successful application of coal to smelting iron, by Abraham Darby, at the Colebrook Dale works, in 1713, and the application of the use of blowing cylinders, instead of bellows, at the Carron Works, set up by Smeaton in 1760.

Our connexion with the Russian iron is of very ancient date. In 1569 the English obtained by treaty the right of seeking for and smelting iron ore, on condition that they should teach the Russians the art of smelting this metal, and pay, on the exportation of every pound, one halfpenny.

Every branch of mining received great development under Peter the Great, who seems to have neglected no branch of material prosperity. It was under his reign and direct patronage that the Demidoff family rose to importance as miners, and obtained the property which has rendered them ever since one of the wealthiest families in Europe. Up to 1784, Great Britain imported a continually increasing quantity of iron from Russia, which in that year amounted to forty thousand tons; after that period, in consequence of improvements in machinery for smelting by coal, the importation gradually declined to about five thousand tons in 1805, and continued at that figure up to 1837, and, probably, is about the same now, being all of one quality in the trade, called C. C. N. D. old sable iron, which is used for the manufacture of steel.

Fire-Arms.—The fire-arms and white-arms exhibited have all been made at the Tula Crown manufactory, where the work is done under the inspection of Government officers, by serfs of the Crown. The oldest manufactory is at Tula, where, besides muskets and side-arms, the iron-work of horse harness, iron bedsteads, files, chains, &c., are made. This establishment was burnt in 1834, according to the rumour of the day, by the workmen, who hoped to get rid of the forced labour imposed on them by the ceaseless wars of the Emperor in Turkey, Persia, and the Caucasus. Under the Russian Royal Factory System, increased work does not give increased wages. But the Tula establishment was rebuilt.

In the North Gallery, the Emperor exhibits, with other furs, a black cloak made from the neck of the silver fox, which he has valued at £3500. this valuation has brought out a letter from Mr. Nicholay, the well-known furrier, who offers to make a finer cloak for £1000, and to place that black and silver fox skins, so much valued in Russia, and so little used here, are chiefly imported into London from the territories of the Hudson's Bay Company, and then purchased up for the express purpose of "being smuggled into Russia as occasion may offer."

What a commentary on the Russian protective system!

In the back of the same case as the furs are two splendid specimens of twilled shawls, by a Cossack woman, from white goats' hair, of wonderful fineness. One of these shawls is the property of the Empress, and justly valued at the price of Brussels lace.

Russian manufactures are for the most part inferior and dear, while minerals, and vegetable, and animal produce could be supplied in unlimited quantities at a profit, if roads were made and facilities given to trade. But Russia is essentially a military country, prepared to take advantage of events, and probably the Emperor considers that a large trade might produce inconvenient pacific tendencies in his landowning nobles.

In conclusion, we consider this a very attractive but imperfect representation of the vast resources of Russia.

ENTERTAINMENT AT LIVERPOOL IN HONOUR OF THE GREAT EXHIBITION

ANOTHER visit paid by the celebrities of the Exhibition to one of our great provincial towns took place on Saturday, the 12th instant. Only recently we gave an account of a reception at Birmingham to the distinguished men connected with the Exhibition, and which, though unattended by any pomp or pretentious ceremonial, was full of a deep significance and interest to all who shared in it. Birmingham, the first town to originate a local exhibition of its own, was appropriately first in the field to welcome the chief actors in the World's Fair down into the provinces. After Birmingham, Liverpool put in her claim to be visited, but in a style peculiar and characteristic. The invitation is given by her leading merchant, the member for the southern division of the county. He undertook to do the honours of the occasion himself thus forming an example, even in hospitable guise, of the private enterprise, united with public spirit, which have combined to make the place what it is. Again, visitors were not asked to go a long journey in order to see different ingenious processes of manufacture. In harmony with the greatness of Liverpool, they were to examine its miles of docks and warehouses—to appreciate by actual inspection the extent of its mercantile marine—to realize the enormous importations of raw produce and the equally vast exports of manufactured goods. They were to have an opportunity of perceiving how great are the advantages of system and order—how a large expenditure in public works, which secures these, is a wise economy in the end. Finally, they were to dine with their host on board one of the great Transatlantic steamers, herself a world of wonders complete—a great exhibition afloat; as this ship was American built and owned, it was only natural that the occasion should be seized on for illustrating the strong practical ties of commerce, superior to prejudice, which, mainly through this port of Liverpool, bind together the parent state and its vigorous and independent offspring.

The invited guests found their way down to Liverpool as best they could, the foreigners getting passes and the natives paying their fares as usual. At 10 o'clock on Saturday morning they all assembled at St. George's Dock landing wharf, where they embarked on board a river boat, and, under the guidance of Mr. Brown, who received them there, proceeded to view the steam-ship *America*, then with her steam up and waiting for the mail bags to start for New York. The spacious quarter-deck, the cabin accommodation, the machinery, and the stores of this fine vessel, were all attentively examined. The Aldermay cow to supply milk, the poultry, the joints of meat enveloped in masses of Wenham Lake ice—these, and a hundred other objects, were carefully noticed. Nor did the complement of passengers, so thoroughly American in their *physique*, fail to attract attention. At length the mail bags were all received, the noble ship started on her way, and, with a parting salute and cheer, Mr. Brown and his friends left her to pursue her voyage. The strangers then took their seats in the Birkenhead side of the river, where they landed and strolled about for some time, viewing with interest that remarkable example of overbuilding and those indications of future greatness and prosperity with which Birkenhead abounds From this place, and the natural train of thought associated with it, Mr. Brown conducted his guests to the *Atlantis* steamer, anchored in the Mersey, and now once more ready for service, having had the recent accident to her machinery completely repaired. As they went on board they were received by the commander, Captain West, who courteously pointed out every part of the ship worth seeing. The *Atlantic* is fitted up with a splendour which is truly astonishing; and one feels quite at a loss whether most to admire the great sweep of her quarter-deck, the magnificence with which her state-rooms and berths are equipped, or the cyclopean dimensions of her engines. After completing their survey of her, the company returned to the Liverpool side of the river, and, led by Lord Granville and Mr. Greville, made their way to the new Albert Dock, the various striking improvements in the construction of which were fully explained to them. Of these perhaps the most remarkable is the application of the hydraulic press power by Armstrong's patent in such a manner as to secure the complete action of cranes, ascending platforms, and other machinery used in docks, at any point, however distant from the engine, by means so simple that the strength of a child can completely control them. There is a small working model of this beautiful invention in the Crystal Palace, which at once indicates its great utility. The extent and contents of the bonded warehouses seemed particularly to astonish the foreigners, who, on entering one room filled with nothing but tea-boxes, and on asking a few very simple questions, were told that the number of boxes was 20,000, the quantity less than usual, and about a week's consumption for the whole country! They also appeared a good deal surprised at the large range of warehouses filled with raw cotton, and considerably longer than the Crystal Palace. The Custom House was afterwards visited, and, lastly, St. George's Hall, a new building now in process of construction, where justice is to be administered, balls to be held, and concerts to be given.

Four o'clock had now arrived, and with it the period fixed for again taking to the water and going on board the *Atlantic* to dine. There Mr. Brown had caused to be prepared a magnificent entertainment, at which, notwithstanding some important omissions, arising from the shuffling and unhandsome behaviour of the North-Western Railway Company, there was nevertheless a large and highly distinguished and influential company assembled. When dinner had terminated,

Mr. Brown gave the "Health of her Majesty, as Duchess of Lancaster," which of course was responded to with great loyalty.

"His Royal Highness Prince Albert, and the rest of the Royal Family," were next toasted; after which, the "President of the United States" was proposed, and Mr. Davis acknowledged the toast.

Mr. Brown then gave the "Health of the Royal Commissioners."

Earl Granville, whose name was associated with the toast, acknowledged the compliment paid to that body. There was at the Exhibition, he said, a model of the docks of Liverpool, to which excessive interest attached, even more than by some was anticipated, and it was daily surrounded by crowds who had never had an opportunity of seeing Liverpool itself. He felt grateful to Mr. Brown that he had not been satisfied with the imperfect notions which models give—and that he, one of the merchant princes, is the true sense of the word, who had brought Liverpool to what it now was, who had enriched it by their commercial enterprise and their ability which they had an opportunity of seeing, who had benefitted it by their attention to the liberal sciences, and sanctified it by magnificent charitable institutions—he was grateful that Mr. Brown had, in that splendid entertainment, given their distinguished foreign guests an opportunity of seeing a town, of which he and his fellow-citizens might so well be proud. If there is a point that could add satisfaction, it was, in that distinction, it took place in one of the Transatlantic steamers, and under the American flag. With the most sincere pleasure he acknowledged the propriety, in Liverpool, of their meeting on what might be termed American ground, and thereby strengthening the feelings of friendship which existed between the United States and this country. There was in the Exhibition, besides the model to which he referred, a collection of raw material, made by Mr. Archer, for the instruction of merchants, and curious as representing the number of raw materials sent to this port from every country in the globe. To-day they had seen the ships which brought that produce, and the magnificence of the docks in which they were stored. But what he wished to impress on their attention, and on that of the foreign guests, was the proof thus afforded how much the prosperity of Liverpool and this country depends on the welfare of those countries which these gentlemen represent. (Loud

THE CARRIAGE DEPARTMENT—FROM A DAGUERREOTYPE BY CLAUDET.—(SEE NEXT PAGE.)

cheers.) He thought they would feel that it was no empty wish on the part of the people of this country, to hope for the future prosperity, for the order, the liberty, and the commercial improvement of all foreign nations. (Cheers.) And when that wish was pronounced, though founded on feelings of self-interest, it was combined with other and higher sentiments—(Cheers)—sentiments which had received a great impulse from the cordial manner and goodwill foreigners of all countries had shown in co-operation with the objects of the Exhibition. (Cheers.)

"The Executive Committee," "The Mayors of South Lancashire," "The healths of Mr. Paxton and Mr. Fox," were amongst the toasts which followed.

Dr. Herman responded to the toast of the "Jurors," in German. He expressed his confidence in the impartiality with which their awards would be made, and said that he had recognised in their proceedings and action hitherto some of the principles which constituted the greatness of England. It was to the concentration of the mind on one point that she had acquired possessions in every part of the world; and in the same way she fulfilled her mission in spreading civilisation to the remotest nations. The impression of the working of this great principle was not lost on those foreigners who had been witnesses of it. The consequences of the Great Exhibition would not be merely commercial, but would also be found in the general influence of her great example in working and acting. (Cheers.)

A series of sentiments were then proposed by Mr. Brown, and were most cordially received by the company. The first of these was, "Success to the undertakings of all men of letters and science, engineers, and mechanics, whose heads and whose hands have added considerably to the social comforts of mankind."

To this succeeded the toast of "Peaceful Commerce—may it ever flourish, to carry religion and civilisation into the remotest corners of the world."

The next toast was, "The Armies and the Navies of the great nations of the earth—may they ever meet as friends, and not as foes, to co-operate for some great public good."

The next toast was, "The World's Commercial Fleet—may it continue to navigate the ocean, free from war's alarms, and add to the prosperity, the happiness, and the comforts of the whole human race."

Captain West, in brief, sailor-like style, returned thanks for his health being proposed, in acknowledgment of the courtesy with which he had received the company on board his ship.

Earl Granville then rose, and asked the company to drink to the health of their host, which, of course, they did very enthusiastically.

Mr. Brown, in returning thanks, assured his guests that it was a source of great satisfaction to him to meet so many distinguished individuals who had visited the Crystal Palace, or rather he would call it the Palace of Peace, by the contents of which the nations of the earth would learn to appreciate each others work. (Cheers.) His only regret that day was the shortness of the notice, which circumstances had rendered unavoidable. He had been deprived of the gratification of receiving many guests whom it would have given him great pleasure to see present. (Cheers.) It would, no doubt, be gratifying to those gentlemen who had honoured him with their company, to be informed how rapidly the important seaport town of Liverpool had risen into its present position, and he would therefore briefly trace its history. In the reign of Charles II. they had but 15 boats at this port, the tonnage of which amounted to 2560. In the reign of Queen Anne these vessels had increased to 170. He thought they had seen enough that day to form an opinion as to the present number. In 1756 their dock dues only amounted to £2200; in 1801 they had increased to £28,000; and last year they were £230,000. Their docks now covered an area of between 200 and 300 acres, and had cost in their creation no less a sum than £10,000,000. The population of the whole county in 1700 was 170,000, and at present it was upwards of 200,000: but the increase in the inhabitants of the town itself had been still more remarkable, having been in 1700 only 6000; in 1801 it was 78,000; and in 1851, upwards of 400,000. In 1760 it took four days to go by coach from Liverpool to London; now they were enabled to reach the metropolis in six hours; while by those splendid vessels, one of which they were then on board of, they could travel from Liverpool to New York in nine or ten days. (Cheers.) It was a most gratifying thing to him, that America, the offspring of their own nation, was now her firmest friend and best customer; and he trusted that the day would never arise when the good feeling existing between them would be disturbed. (Cheers.) He wished to impress upon foreigners, that it was their interest to give to this country whatever was of least value to themselves, but most valuable to us; while Englishmen would give them in return whatever was least valuable to themselves, but of most value to their friends. (Cheers.) Mr. Brown sat down, again thanking the company for the honour they had that day conferred on him by accepting his hospitality.

This terminated the festivities on board the *Atlantic*, but they were resumed and continued to a late hour at the Town Hall, the fine suite of rooms in which were thrown open to from 1200 to 1500 gentlemen, comprising all the influence, respectability, and wealth of Liverpool. The Mayor, though the chief duties of receiving the strangers devolved upon Mr. Brown, welcomed them with great hospitality, and the foreigners especially appeared immensely gratified with the cordiality of their reception.

ENTERTAINMENT IN HONOUR OF THE GREAT EXHIBITION ON BOARD THE "ATLANTIC," AT LIVERPOOL.

THE CARRIAGE DEPARTMENT.

THE Carriage Department, which is included in Class 5—that of "Machines for Direct Use"—is not without its wonders and its attractions for the whole locomotive community, from those who "ride in chaises" of their own, to those who take their fourpenny-worth in a "bus," or make their last journey in a hearse. And all may be here provided. The contributions are abundant, coming from every part of the United Kingdom: Dublin, Edinburgh, Southampton, Birmingham, Bath, Bristol, Worcester, Hastings, Greenwich, have each their display, of some sort or another. Long-acre and Bond-street, of course, have the largest, and perhaps the stateliest show; but Dublin and Southampton are not far behind. We shall defer our general review of the contents of this department till a future occasion; meantime, we shall only notice one or two contrivances which attracted us by their novelty upon our first flying visit. The supply of cars and dog-carts struck us particularly, for their novelty in structure in many cases, and generally for their extremely dashing appearance. Anderson, of Elgin, sends a Victoria car, a two-wheeled vehicle, seated for four, and convertible into a two-seated gig or car by a single turn of the key. Cousins, of Oxford, also, has a somewhat similar contrivance, or two-wheeled sporting carriage, adaptable, by means of a concealed screw, for either two or four persons. Kesterton, of Longacre, has an "Amemptou" carriage, a close, double-seated carriage of novel design, which, by a very simple contrivance, may be converted into a light, open barouche, being thus adapted either for summer or winter. These and other similar contrivances for making two descriptions of vehicle out of one, are certainly very ingenious; though, practically, we must say we question their advantages. Certainly, as far as solidity and lasting quality go, we prefer a simple, single-purposed vehicle. Beakcomb, of Chislehurst, has a "model carriage," which, amongst other merits, presents that of a contrivance for indicating the distance of ground travelled over. This, when it is carried successfully into effect, as it must one day be, will be a very important point gained, not only as regards hired vehicles, but private carriages, the owners of which, for the sake of their horses, are always interested in knowing how much ground has been gone over in the course of the day by the servants or others entrusted with the vehicle for the time being. Willoughby, of John-street, has a very completely equipped carriage for invalids, whereby they may be removed from their beds without any change of posture. An interesting wax lady, with rather blooming cheeks and remarkably neat cap, occupies this vehicle, being occasionally drawn forth amidst the breathless admiration of bystanders. The undertaker-general, Shillibeer, has a very spruce patent funeral carriage, "expanding and contracting at pleasure;" so that single gentlemen and family parties may be accommodated at a moment's notice. Model omnibuses of gorgeous colouring, and unlimited resources, are sent in in competition by various makers, and we hope some of them will be tried in place of the rusty, uneasy-going rattle-traps which ply upon many of the roads contiguous to the Great Exhibition, to the great astonishment and discomfort of the bones of her Majesty's liege subjects.

SIDEBOARD.—BY JACKSON AND GRAHAM.

ORNAMENTED MARBLE TABLE. BRIGHT.

This table is manufactured in Derbyshire black marble, ornamented with flowers in various-coloured stones, serpentine, lapis lazuli, &c., by Selim Bright, of Buxton, in Derbyshire. The design and execution are alike creditable; the workmanship being most minute and intricate—some of the flowers, we understand, containing many hundreds of separate pieces of stone.

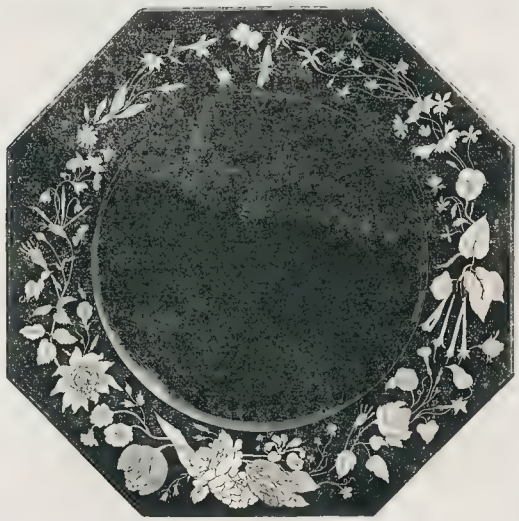
MOSAIC TABLE-TOP. BARBERI.

In our Supplement for the 12th of June we gave an article explanatory of the construction of mosaic pictures, with particular reference to the school of the Vatican, which may be considered the fountain-head of the art. In our present sheet we engrave a very beautiful table-top by Barberi, of Rome, the border of which contains a variety of views of public buildings, and other celebrated spots in Italy. The patient industry, ingenuity, and taste displayed in the production of these works are truly wonderful; and, what is more, the beauty of the result is fully commensurate with the labour bestowed.

SIDEBOARD. BY JACKSON AND GRAHAM.

This is a very substantial and handsome production, upon which an immense amount of inventional taste, and manual labour in the carving, have obviously been bestowed. The ornamentation is rich in the highest degree, and almost to be styled ambitious; but the general arrangement is so chaste, and the harmony and repose resulting from the adoption of a single description of wood—British oak—so complete, that the eye is by no means fatigued, nor the attention unduly taxed by details. The upper part is generally after the styles of Elizabeth and Francis I. Within the columns are handsome mirrors. The sideboard is supported by four little boys, of whom the two at the extreme ends are emblematic of wine and bread respectively, whilst the two on the inside stand as the representatives of fishing and hunting. On the panels are groups of fish and game, and other appropriate subjects, carved with remarkable boldness and exquisite finish.

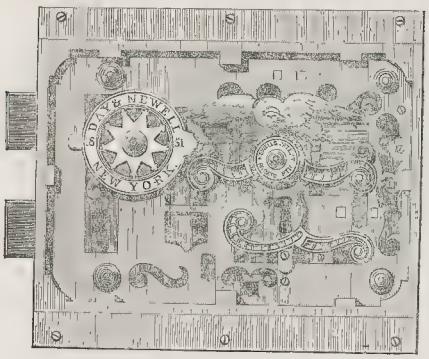
MOSAIC TABLE-TOP.—BY BARBERI.



ORNAMENTED MARBLE TABLE.—BY BRIGHT.

NEWELL'S PATENT PARALOUPTIC BANKLOCK.

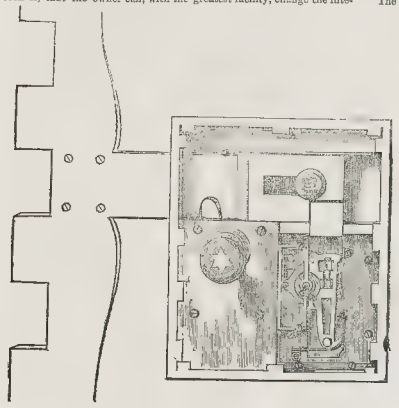
Few things in the department of the United States have attracted more attention than the safety lock of Newell, both from its own merits, and the great controversy now going on about locks, in consequence of the feats of lock picking performed by Mr. Hobbs, the agent of Messrs Newell,



DAY AND NEWELL'S PATENT AMERICAN LOCK.

and other ingenious Americans. Of this controversy, and their ability to pick those hitherto considered perfectly safe in this country, we shall at present offer no opinion, as the matter is under the consideration of the Society of Arts, and will be properly investigated by them.

That Mr. Newell's lock is one of very ingenious and beautiful construction, there can be no doubt; and, as he deserves, he has received medals from some public institutions and scientific bodies in America and Europe on account of it. The most important feature in the Newell lock is, that the owner can, with the greatest facility, change the interior arrangement to a new and more complex one at any moment he pleases, simply by altering the arrangement of the bits in the key; and this is accomplished without removing the lock, or any part of it, from its position on the door. Its operation is as follows:—At the closing or locking of the lock, whilst the bolt is projecting, the moveable combination parts assume precisely the position prescribed to them by the key, according to the particular arrangement of its bits at the time the key is turned. The combination parts do not consist in one set of tumblers only, such as are found in most other locks, but there are three distinct sets or component parts, fitting into each other. When the bolt is projected, it dissolves the mutual connection of the constituent pieces, and carries along with it such as are designedly attached to it, and which assume the particular positions given them by the key in its revolution. These parts are rendered permanent in their given form by means of a lever adapted for the purpose, while the parts not united with the bolt are pressed down by their springs to their original places. If now the bolt is to be returned again—in other words, if the lock is to be unlocked—the constituent pieces or tumblers, which are in the original state, must, by means of the key, be again raised into that position in which they were when the lock was closed; otherwise, the constituent parts attached to the bolt would not lock in with the former, and the bolt could not be returned. Nothing, therefore, but the precise key which had locked the lock can effect the object. This lock is said to have another peculiar feature, one of considerable value, that it will withstand the action of gunpowder.



CHUBB'S BANKERS' SAFE-LOCK.

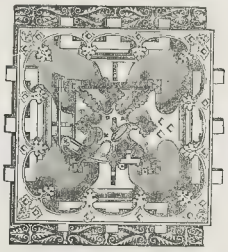
CHUBB'S LOCKS AND SAFES.

The articles sent for exhibition by Messrs. Chubb, comprise specimens of their patent detector locks and latches for various purposes. Each lock consists of six distinct tumblers (except in the very smallest sizes), working on a centre pin; all of which require lifting to various heights by the key before the lock can be opened or shut; and not until each tumbler is lifted to its proper position, can the stud, which forms a part of the bolt, pass through the slots in the tumblers. A "detector," forming the great and peculiar feature of Chubb's lock, is added; and, in the event of either of the six tumblers being overlifted, in an attempt to open it by a false key or picklock, one of them is caught by a detecting spring in such a manner as to render it impossible to open the lock on the application of its own key. Notice is thus given of the attempt, and the lock may be set right by turning its key in a contrary direction, as in locking.

In design the locks are of various styles, Norman, Gothic, Elizabethan, &c., with appropriate steel and or moulu mountings, and ornamented keys, suited for ecclesiastical buildings and other purposes.

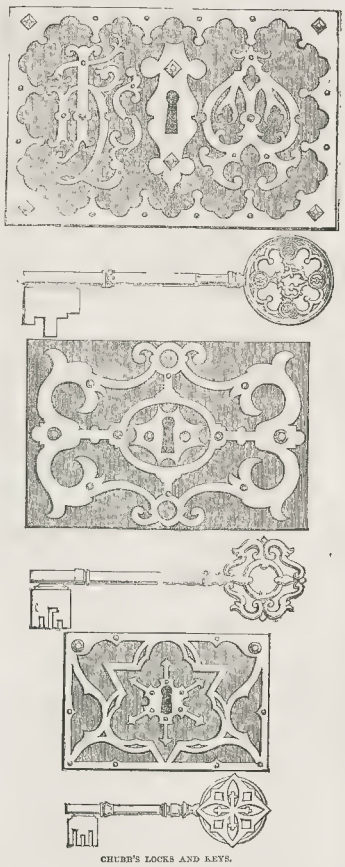
The patent quadruple lock for a banker's strong room door, consists of a combination of four separate and distinct locks in one, all being acted upon at the same time by a single key with four bits. For further security, there is a check lock in addition, throwing a hard steel plate over the large keyhole. The patent rim lock contains eighteen tumblers, with three different detectors, each acted on by six of the tumblers, and has been constructed to show the principle of Chubb's three different patents, dated 1824, 1833, and 1847.

The patent fireproof bankers' safe is made of wrought iron, the iron of the body being ½ inch thick at the thinnest part, and the doors 1 inch thick, the whole being lined throughout with hard steel plates to prevent drilling. To render the safe fireproof, it is lined with two separate and distinct chambers, 6 inches thick, filled with dried non-conductors of heat. The interior is fitted up with drawers, cupboards, &c., in a manner suited to bankers' or merchants' use. The folding-doors are secured by two patent detector wheel locks, throwing twenty-eight bolts out all round, and are further fitted with case-hardened iron escutcheon locks over the keyholes of the principal locks. Its dimensions are 6 feet 6 inches high, 4 feet wide, and 3 feet deep, and its weight is 3 tons 5 cwt.



CHUBB'S LOCK (INTERIOR).

Messrs. Chubb also exhibit a model of their patent well safe, by means of which a safe containing any valuable property can be lowered to any distance below the surface of the ground, and secured by a fireproof door and framework at the mouth of the well.



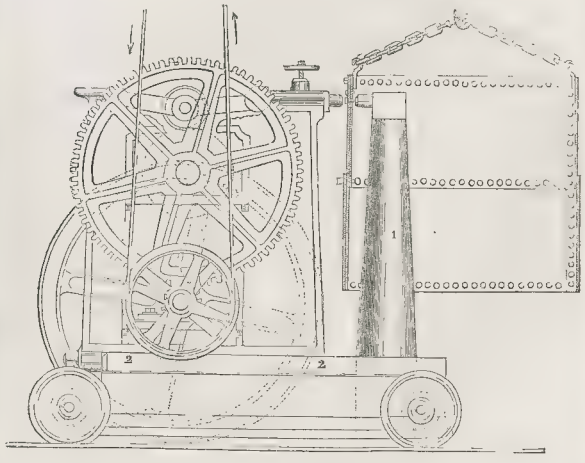
CHUBB'S LOCKS AND KEYS.

FAIRBAIRN'S PATENT RIVETING MACHINE.

This is a machine lately invented and brought into use by the Messrs. Fairbairn, of Manchester, for riveting the seams of boilers, &c. It owes its origin, we believe, to a turn-out of the boiler-makers in the employ of the exhibitor, about fifteen years ago. The principal advantage attributed to it is that it does noiselessly, at once, and with unerring precision, by simple compression, that which was formerly done by means of repeated blows of a hammer; and that before the rivet has lost its heat, so that by its contraction in cooling it grips the plates still tighter together. This machine is capable of fixing in the firmest manner eight rivets, three-quarter inch diameter, in a minute, with the attendance of two men and two boys to the plates and rivets; whereas the average work that can be done by two riveters, with one "holder-on" and a boy, is forty similar rivets per hour—the increase in quantity of work done by the machine being at the rate of twelve to one, exclusive of the saving of one man's labour. The work, also, is done better, for reasons already stated, the boilers being more secure from leakage than under the old method.

The construction of this machine will be easily understood, by those conversant with mechanical and engineering contrivances, from an inspection of the Engraving. The large upright stem is made of malleable iron. The riveting dies are of various descriptions, adapted to every description of flat or circular work; even the corners are rivetted with the same care as other parts, so that vessels of any shape may be completed without recourse to the old process of hammering.

CHUBB'S FIREPROOF SAFE.



MESSRS. FAIRBAIRN'S PATENT RIVETING MACHINE.

THE CHEMISTRY OF THE GREAT EXHIBITION.

HOWEVER desirable in theory an absolutely perfect classification of a museum may be, those who have been engaged in the arrangement of productions well know that the desideratum has never yet been attained. Very wisely, we think, did the Commissioners of the Exhibition agree, that any attempt to approach a rigorous classification of the world's stores would not belong to any portion of the task which they had proposed to themselves. Had it been otherwise, what discussions and counter discussions would have ensued—what warring arguments by the learned what ransacking of musty tomes!

Without finding any fault with the gentlemen of the Executive Committee, or with their classification of subjects, it is quite competent for us, as journalists, to have a classification of our own. Desirous of laying before our readers some indications of the advancement of chemical science, we sallied forth, Catalogue in hand, entered the glass walls, and proceeded straight to the department of chemical and pharmaceutical products. These we reviewed *seriatim*, as our readers know; passed them one by one under notice, indicated their applications, and pointed out their merits and defects. We return to the subject of the Chemistry of the Exhibition once more, and, without any sort of disrespect to the Executive Committee, we leave our Catalogue behind, and sketch out a new course of procedure for ourselves.

Instead of confining our excursions to the division allotted to chemical and pharmaceutical productions, we shall take a wider range; let us pass rapidly through every part of the Exhibition, and as rapidly discuss in few words the most prominent indications of chemical agencies which are presented to our view. Our entrance is by the South Transept door—on a people's day. Sixty thousand human beings are pent up within three crystal walls, and our wayward contemplation wanders for a moment from the inanimate chemistry of the Glass Palace, to the animate chemistry of sixty thousand pair of lungs. Respiration is a sort of burning without fire, designed to rid the circulating blood of its carbon or charcoal, which latter as effectually disappears by the act of respiration as a piece of charcoal disappears when thrown into the fire; disappears, but is not lost. Charcoal when burned unites with oxygen, a constituent of the air, and forms carbonic acid gas: this is the very gas evolved from the lungs; and, just as heat is developed by combustion, so is heat developed in the lungs. Respiration, then, as we have said, is only combustion without fire. As the presence of carbonaceous matter in the blood is so strongly repugnant to nature that an animal breathes even in sleep: and the heart, never tiring, pumps forth its dark and impure blood to undergo the process of burning off its carbon in the lungs—we may, indeed, be thankful that the evolved carbon is made to assume the form of an invisible gas: had it been otherwise, we should have been from one end of our lives to the other hidden in sooty fumes. Each individual on an average evolves nearly 3000 grains of carbon in the course of twenty-four hours; therefore, the 60,000 people now present will, in the same time, have emitted from their lungs no less than *eleven and a half tons* of the matter of charcoal, which, if collected in a mass and burned under the steam boilers of the Exhibition, would be sufficient to keep in motion the whole of the machinery for about the space of a week. Again, if the whole amount of heat produced by the respiration of the 60,000 people during the twenty-four hours were collected, it would be found exactly equal to the amount of heat given off from the eleven and a half tons of carbon evolved, if condensed into fuel and burnt under the steam-boiler. But what becomes of the noxious carbon, in the form of carbonic acid emitted from the lungs? Nature will not have it in the animal economy, as we have seen; and if an animal be made to breathe this gas, he dies. What, then, becomes of it? The provision is simple: vegetables greedily absorb the very gas which animals reject, reduce the carbon into a solid form, and liberate the oxygen again. Thus is the balance of purity in the air kept up.

The atmosphere contains about one part in a thousand of carbonic acid, and doubts have been sometimes entertained whether this minute quantity be sufficient to account for the carbon which, by the processes of decomposition, enters into the composition of animals and plants. At present these doubts we believe have ceased to exist, Liebig and others having shown that the quantity, though apparently small, is amply sufficient.

But the most curious speculation rising out of the presence of carbonic acid in the atmosphere is in connexion with the formation of coal beds. Coal, as we all know, is but the remains of antediluvian wood, buried by convulsions of nature under enormous weights of overlying strata, and exposed to the decomposing effects of ages unknown.

Now, the various stages of decomposition which wood undergoes in being transformed into coal can be traced in the very structure of the leaves can be seen; which evidence we know that the coal beds of Europe were originally accumulations of gigantic ferns. Ferns, which in this country are mere plants, grow in the West Indies and elsewhere to the size of trees. These fern trees were formerly very prevalent, and from them our coal beds are chiefly derived.

It has been suspected by various chemists that the atmosphere at the period when the coal depositions were going on, contained more carbonic acid than it does now; botanists, too, had reason to imagine that the fern tribe would thrive in an atmosphere more teeming with carbonic acid than other vegetables. Accordingly, Professor Danberry, of Oxford, and, we believe, also Mr. Hunt, tried the experiment of growing plants in factitious atmospheres largely charged with the gas. The results went to prove that the opinions of the botanists were well founded, and that in all probability there existed considerably more carbonic acid in the atmosphere when the coal measures were being formed than there does at this time.

As we are on the subject of respiration, let us now turn to the gold fishes. Fishes breathe as well as terrestrials, but they do not breathe by lungs. They have gills—specially adapted to absorb the air which water, in its natural state, always contains. Were the water actually pure, the fishes could not live, neither would such water do for the purposes of human drink. At this moment there is a metropolitan clamour for pure water. We have seen that pure water would be quite out of place; nevertheless, impurities admit of classification, and we admit that London water contains impurities of a most objectionable kind.

Carbon being the theme of our chemical incubations, away we rush, like other people, to the parrot-like cage where stands the Koh-i-noor: that most precious of Eastern trophies—the diamond that won't shine.

On a previous occasion, in an article on precious stones—the Koh-i-noor amongst the rest—we then stated, that, if the monster jewel should happen to come within the dominion of a European dealer in gems, it would be reduced, by cutting, very materially in size, and, although proportionately diminished in weight, its splendour would be greatly enhanced.

Now the term cutting, though very generally used in regard to diamonds, is very far from the best; grinding would be far better, as, when explained, our readers will not fail to see.

When by chance there is broken off in family service the foot of some treasured glass goblet it may have occurred to some of our readers to see the thrifty housewife take it to the stone sink, and, rubbing the fractured glass on the—aiding the grinding operation by water and sand—at length produce a surface more or less smooth. On this principle diamonds are ground, with the difference merely that the friction is not given by a stone and it, but by metal—that the metal plate, a flat horizontally revolving wheel, rubs against the diamond whilst the latter remains still, and that, instead of silver sand, the friction powder used is diamond dust.

Diamonds are now chiefly cut, as we mentioned on a former occasion, in Amsterdam. We once saw the operation going on, and will proceed to describe it.

It was on a Sunday, in the early part of 1847, that, being at Amsterdam, we wandered out from our hotel on a chance excursion through the town. Before we had gone far the noise of machinery arrested our attention, and, on making inquiries, we found that it proceeded from the celebrated diamond-cutting establishment of the place. Let not the reader picture to himself a clean, neat, well-looking establishment, such as one of our paper or cotton mills, but an old lumbering shed, in which, impelled by the labour of four or five sorry horses, revolved a horizontal wheel. This was the only source of motion by which the grinding machinery was kept at work; and its primitive nature in a century when the steam-engine is made to spin cotton, grind corn, and weave cloth, could not but suggest to the looker-on how remote from ordinary wealth—wealth self-developing and expansive—was the conventional wealth represented by the diamond trade. The operation of cutting is performed in several dilapidated rooms up stairs. There are seen in rapid revolution some scores of horizontal metal wheels, each about a foot and a half in diameter. Their surfaces being smeared from time to time with a mixture of diamond dust and olive oil, and set in revolution, the diamond to be ground is brought in contact with the revolving metallic surface. The operation of grinding goes so slowly on, that if the Koh-i-noor were to be cut according to European taste, the operation would last many years. It need hardly be said, that the task of holding a diamond to be ground firmly against the revolving wheel for so long a period of time as is necessary, would be impossible. Continuous pressure is effected in another and very simple manner: the diamonds are imbedded, all except the part to be ground, in a heavy mass of very fusible solder shaped like a hammer, the handle of which being fixed as to horizontal motion, but free by means of a hinge to move up and down, and the face of the hammer being brought flat upon the side of the horizontal wheel, the operation of grinding, cutting as it is called, proceeds without further trouble.

Numerous have been the speculations from time to time about the original source of the diamond. Coal we have seen is nothing else than wood matter, which has been subjected to a peculiar decomposing agency for countless ages past. The diamond being of kindred composition, has it also a kindred origin? On this point philosophers are still in doubt; but that the diamonds were liquid or pasty at the period of their origin, most people now are agreed. Many diamonds contain, locked up in their centre, a little bubble of air, and some have been found inclosing insects, and small bits of vegetable *debris*—neither of which could have found their way into the middle of crystals whilst in a state of adamantine hardness. So much, then, or diamonds. Let us pass on and see what other chemical themes are suggested by things about us.

The objects which first strike us are the sculptures. They are made of various materials—plaster, marble, zinc, iron, and bronze; all of them suggestive of important chemical reflections, and some of them the direct result of the agency of chemical art.

Let us first turn to the equestrian statues of the Queen and Prince Albert, by Wyatt—intended, as we are informed, for bronze. Plaster is a material good enough for works of art of this and similar stamp. But we have unconsciously diverged; and, instead of explaining the chemical nature of plaster of Paris, we find ourselves critiquing a work of art. Plaster of Paris is also called gypsum, and by the chemist sulphate of lime—which latter name, like most others employed in chemistry, is directly indicative of the composition of the body described. Thus, plaster of Paris is a compound of sulphuric acid, or oil of vitriol, and lime: just as marble is a compound of carbonic acid and lime, as we shall discover by and by. The term plaster of Paris is applied to sulphate of lime because it exists very abundantly near the French capital; or rather we should say, that in the neighbourhood of Paris there exists gypsum, which is sulphate of lime chemically united to water, and from which, by exposure to the agency of fire, the water may be driven off, leaving the dry or anhydrous sulphate of lime behind, to which body we may with greater propriety apply the term plaster of Paris.

Since the art of making wax fruit has been so prevalent amongst amateurs, the peculiar moulding property of plaster of Paris has become familiar to most. If a portion of the substance in powder be rapidly mixed in water to the consistence of a paste, and poured into a mould, or on a surface of any kind, the paste presently sets, that is to say, becomes dry and hard, and may be removed from the mould or surface, from which it has borrowed every mark of impression or relief. The chemical *rationale* of the setting of plaster is this. We have seen that by the agency of Kiln-burning plaster of Paris was made to evolve a considerable amount of water, which entered into its composition in a solid form. Now this water so evolved the substance takes every opportunity to reappropriate, which being accomplished, the powdered waterless or anhydrous sulphate of lime acquires the same composition and very near the same physical state as it had whilst in the native quarries. But this is not all: during the act of combination with water the plaster expands, and thus is more readily adapted to assume the form of any surface with which it is brought into contact.

Plaster casting may be termed the second stage of the art of statuary; modelling in clay, which will hereafter come under our notice, being the first. Besides its use in this way, plaster of Paris has many other applications, which we cannot find time to allude to here. One, however, must not pass unnoticed, especially as an illustration of it appears in the Exhibition. Some years ago, it was discovered, that by combining plaster of Paris with alum in a certain way, there resulted a very hard substance, to which the name was given of marble cement. Not content with cement, a modification of the same preparation has now been converted into a substance to which they term artificial marble has been given. In the English part of the Exhibition may be seen a very nicely moulded classic capital formed out of this material.

A piece of statuary having been cast or moulded in plaster, the next step is to carve it in marble, or cast it in some sort of metal usually bronze; but occasionally iron or zinc, of which two latter media there now exist many beautiful castings. Many a spectator who gazes with admiration over a modern sculptured work of marble or bronze, will be surprised to be informed that in the actual formation of either of these, and more particularly the ones of marble, the artist's hands have been but little employed. His thoughts are exercised, his genius brought into operation, and made to bear on far more plastic materials than either marble, iron, or bronze, zinc, or even plaster of Paris. The sculptured figure is moulded in pipeclay; which operation being accomplished to the artist's satisfaction, an artizan in casts, usually an Italian, prepares the plaster copy, and from the plaster copy is executed, by mere workmen, the figure in marble or other material. Eventually, the artist gives a few touches more or less, with his chisel; but very few if the material be marble—indeed sometimes none. The method by which the marble statues are formed by workmen is amusing enough. Before the operator on one side stands the plaster cast to be copied; on the other side, marble in a shapeless block. This latter he first chips into something like the form desired, and then he has recourse to a machine, the operation of which is of this kind:—Suppose the level of the eye of the statue is exactly half an inch below the level of the brow; then, where the artist is to be, the workman drills a small hole, exactly half an inch below the brow level, and marks the hole black. This operation he repeats on innumerable points; and then, taking his chisel, he chips carefully away every trace of the black perforations. The result of which must evidently be, that, if his perforations were correct, he will have produced the copy of the plaster face on the surface of the artist's block.

The metal iron has been usually thought inapplicable to the purposes of statuary, except for the rough varieties of work; and although now its value in this respect is greatly inferior to bronze, yet improved modes of manufacture have enabled the founder to give us admirable specimens of artistic castings.

The general reader will have, no doubt, heard of the terms cast iron and wrought iron. The former is iron in a state of admixture with various other ingredients, chiefly silica and carbon, the result of which is that the fusibility of the metal is greatly increased; wrought-iron is the metal reduced to a condition of comparative purity, by which, although its fusibility is greatly diminished, there is developed another exceedingly valuable quality, namely, that of welding, by which is meant that incipient condition of fusion or pastiness which enables the blacksmith to join two pieces of iron together by merely beating them with the hammer on an anvil. This quality of welding is only partially true, and that very imperfectly, by the metal platinum. Although iron is rather an ungracious metal for the artist's castings, yet exception should be made to a certain iron natural combination with silica, from which the Berlin toy castings are made.

Most of our lady readers, we doubt not, have seen the celebrated Berlin iron necklaces, chains, ear-rings, bracelets, and the like; they are made by casting, and as examples of the perfection of this art are unrivalled. Only one ore of iron has hitherto been found adapted to the formation of these toys, and our readers will, we have no doubt, be surprised to be told, on the authority of the celebrated naturalist Ehrenberg, that the ore in question is but the remains or *debris* of certain little animals now extinct, the skeletons of which were largely made up into iron.

In the Prussian division of the Great Exhibition some of these celebrated castings may be seen; and those who have not yet paid them a visit we would counsel to do so. Infinitely more interesting are they to our fancies than the mere toys, and our readers will, we have no doubt, be surprised to be told, on the authority of the celebrated naturalist Ehrenberg, that the ore in question is but the remains or *debris* of certain little animals now extinct, the skeletons of which were largely made up into iron.

Bronzes are compositions in various proportions of copper, tin, and sometimes zinc. Cannon metal, bell metal, and statuary metal may all be regarded as modifications of bronze. Statuary bronze is moderately soft; but, by a slight modification of preparation, bronzes may be made nearly as hard as steel, and susceptible of receiving a very fine edge. Long, indeed, before the discovery of the means of working iron, and converting it into steel, bronze was used for the purposes of agriculture and war. Some moderns have doubted whether bronze were capable of receiving a keen edge. Sir Francis Chantrey settled this point, practically and for ever, by causing a bronze razor to be made, by the aid of which he shaved. Thus he vindicated the credit of ancient records, it is true; but, as we have been informed, at the expense to himself of a considerable amount of personal suffering. He proved his case, however, which was a great thing; not to be put in comparison with the casual suffering of having a few hairs plucked out by the root.

The application of zinc to the purposes of statuary is quite new; but, from the success evinced in the works of art to which it has lately been applied by the Belgians and Germans, we have no doubt that its employment for this purpose will largely increase. Nothing can be more fine in every respect than the beautiful Amazon group of Kiss, the Berlin sculptor—this group, we need not inform our readers, is of zinc bronzed.

It is but natural that the discovery of the value of zinc for artistic castings should have been made by Belgians and Germans, inasmuch as from the mines of Belgium and Prussian Silesia is derived by far the greatest proportion of commercial zinc. England, rich though she be in minerals generally, is rather poor in available zinc. Of the ore called sulphuret of zinc we have a considerable amount; but it is difficult to work, and yields an unsatisfactory result. Of carbonate of zinc—the ore in which the two celebrated mines of Belgium, the Vieille and Nouvelle Montagne, and the Silesian mines are so prolific—we have but little; so in the zinc smelting branch of metallurgy we must ever consent to remain largely dependent on our neighbours.

While on the subject of zinc, it may be proper to say, that, if divided into thin shavings, this metal will burn on the application of fire with great brilliancy, yielding an oxide or ash of snowy whiteness, which the ancients under the denomination of *lana philosophica*—philosophical wool. Very lately this material has been introduced as a pigment, both for rough and artistic purposes. Its advantages consist in being free from the poisonous qualities of white lead, and never turning black by the action of sulphuretted hydrogen. Its disadvantages are, that it will not commingle kindly with oil, as does the carbonate of lead, to form a sort of cream, and that it is deficient in opacity. For artistic purposes, it will probably supersede carbonate of lead; but, for rougher work, the poisonous compound will, we think, maintain its supremacy.

SALTER'S MODEL OF THE GREAT OPENING BRIDGE AT SELBY

There are within the walls of the International Palace of Industry many choice models of bridges, which have been executed by some of our first engineers. Several of them are to be found in the Civil Engineers' Gallery—West Gallery, while others have been considered worthy of being placed in the great central avenue, or Brit. Nave. Among these, Salter's Model of the Great Opening Bridge at Selby, on the line of the Hull and Selby Railway, is particularly worthy of notice, and the work represented is of so novel a character, on account of its large span, that we consider many of our readers will be glad to learn some particulars as to the details of its construction.

The river Ouse is at all times rapid, and particularly so during the time of the frequent freshes or floods; it required, therefore, that a bridge of peculiar construction should be resorted to, in order to meet the requirements of the peculiar case. By the act of Parliament for the Hull and Selby Railway, which obtained the sanction of the Legislature in 1836, it was stipulated that the bridge at Selby should have an opening arch of 44 feet span for the sea-borne vessels trading to York. Messrs. Walker and Burges, who have erected so many of the cast-iron bridges which are dotted about in different parts of the kingdom, were engineers for the railway, the bridge, therefore, was executed under their direction; the contract for the iron-work being undertaken by the Butterly Iron Company, and carried out with the usual spirit displayed by that firm. The river at the point of crossing is about 600 feet in width, and at low water 14 feet in depth, the tide rising 7 feet at springs and 4 feet at neaps. The bed of the river consists of silt resting on a thin bed of sand, beneath which is clay of a hard quality. The bridge was commenced in the autumn of 1837, and finished in the spring of 1840. The land abutments are principally executed of brickwork and masonry resting on piles; over the under the west abutment being 18 feet, and those under the opposite abutment 28 feet long respectively. The intermediate piers for the support of the superstructure are formed of open pile-work, the piles being driven 12 feet into the solid clay, and their tops connected with cap sills of large scantling, upon which the iron-work is bedded.

To give additional stiffness to the two centre piers, a plan was resorted to in the bracing, which, although novel in itself, was executed with very little difficulty, and is found, after years of experience, fully to answer the purpose. This was effected by rounding the centre piles for a portion of their length, so as to allow the cast-iron sockets to descend and take a solid bearing on the square shoulders of the piles, to which were connected the long timber braces; so that when the sockets, with the braces attached, were let down to their bearings, the tops of these braces were brought to their places at once, and secured to the cap sills.

The superstructure is of cast iron, consisting of six ribs in the width of the iron-work of the opening arch is formed of two leaves each, worked upon a centre carriage, with rail-pieces acting as counterbalances for assisting the opening and shutting when necessary. This is accomplished by an iron segment of nine feet radius firmly fixed upon the main shaft, and of wheels so arranged that one man can raise or lower either leaf of the bridge in fifty or sixty seconds.

A double line of railway is laid along the bridge on continuous timber bearers. To provide for the effects caused by changes of temperature on the iron-work of the bridge, wedge-shaped iron keys, fitting into proper grooves at the junction of the two leaves of the opening part of the bridge, are inserted to such a depth as to give the necessary play.

The extreme variation of the width of the opening from the above centre is found to be about three-quarters of an inch. The entire weight of cast and wrought iron is equal to about 600 tons, and the weight of each leaf of the opening span rather more than 90 tons.

TO CORRESPONDENTS.

SILVER INKSTAND, BY DODD.—The silver inkstand, described in our Supplement out of the 21st June, should have been stated as by P. G. Dodd, and not Messrs Dodd.

J. BLAKE'S ENVELOPE FOLDING MACHINE.—Some doubts of this machine, it is erroneously stated, had Mr Delorme was the inventor. It appears that it is the joint invention of Mr Edwin Hall and Mr Henry [illegible] Cheltenham.

LUCIFER TOM [illegible] Lundeens brass letters, inquiries [illegible] Hopwood, [illegible] Co., [illegible] it was wrongly attributed to the [illegible] well, which was designed by Mr Nocealla, of Copenhagen.

In the notices of horological ingenuity in page 601 of our last volume, a typographical error in the spelling of Mr Dent's name occurred in the description of Mr Dowbiggin's improved [illegible] in the sixth line, where "axis of vibration" should read "arc of vibration."

A. N. Rooke Lodge, a letter addressed to Messrs Smith and Elder, the publishers, Cornhill, will reach the authoress in quest on.

FIELD.—The Heraldic Inspector's Institution, 66, Hatton-street, London.

A. and D. SUBSCRIBER, Dublin.—The liveries should be red and yellow, the first colour and the latter metal in the arms.

R. H.—Hardy, of Airlich, in Scotland, bears "Gu. a fesse or, between three mullets of the second, and a mascle in base, arg." Harvey, of Castle Semple, in Renfrewshire, bears "Gu. on a bend [illegible] three [illegible] Or, on a chief [illegible] a [illegible] between two [illegible] of the [illegible] Or, a [illegible] between two [illegible] of the [illegible] Or, a [illegible] between two [illegible] of the [illegible] Or,

CENTRE-PIECE FOR TABLE.—BY VITTOZ.—(SEE NEXT PAGE.)

STAINED WINDOW.—BY GIBSON, NEWCASTLE.

The Norman tracery window, by Gibson, of Newcastle, the upper part of which is engraved above, is a rich specimen of the art. In the central compartment is represented the Nativity; and in the four principal compartments above and below it, two and two, are the four principal prophets, Moses, David, Isaiah, and John the Baptist. The arrangement is simple and effective, and the colouring extremely rich.

CABINET.—BY W. AND C. FREEMAN, NORWICH.—(SEE NEXT PAGE.)

JEWELLED HAWK, EXHIBITED BY THE DUKE OF DEVONSHIRE.

The Jewelled Hawk, the property of the Duke of Devonshire, is a new contribution to the Netherlands department, being located not far from Mr. Hope's jewels, with which it divides the attention of the *virtuosi*. The history of this bird is not without interest. It rejoices in a name proper, being the "Kayphausen Hawk," and was made, many a long year ago, to commemorate the reconciliation of two noble Dutch families which had been long at variance. It contains within its gay plumage the identical gold drinking cup which was used by the rival Counts upon the auspicious day of their reconciling, and which is discovered upon removing the head of the bird. The wings and body are chiefly covered with rubies; turquoises, emeralds, and other precious stones are displayed in other parts. The bird stands about a foot high, more or less, and has a very stately appearance.

JEWELLED HAWK.—DUKE OF DEVONSHIRE

CENTRE-PIECE. VITTOZ.

This magnificent *surtout de table* was manufactured by Vittoz, of Paris, for the Grand Duchess of Russia. The design is sumptuous and elegant, and it is executed in bronze richly gilt. This work is a favourable specimen of French decorative art, and will be much admired.

CARVED CABINET. BARBOTTI.

We have already given representations of some of Barbotti's beautiful productions in wood carving. We now produce an Engraving of a work of more importance than any of those referred to, and which may justly be signalised as one of the gems of the Tuscan department. This beautiful cabinet, in walnut-tree wood, is of classic and elegant form, and every portion of its surface is covered with sculpture of rich and appropriate character. The principal subjects on the panels are from the "Iliad," which are rendered with a degree of spirit in the conception, and a delicacy of execution, which can scarcely be excelled.

CABINET. BY FREEMAN

The ornamental cabinet, secretary, and bookcase, carved in walnut wood and ebony, by W. and C. Freeman, of Norwich, is meritorious in many respects, but betrays the fault of over-decoration, without any fixed principle of design. Cherubim, dragons, terminals, and other fabulous creations are brought in plentifully to aid the general effect, which is one of confusion. The workmanship is good.

STUFFED FROGS.—FROM WIRTEMBURG.—FROM A DAGUERREOTYPE BY CLAUDET.

THE NATURAL HISTORY OF THE EXHIBITION.

TAKEN in its widest sense, the title we have just written would indicate an essay on almost all the products—animal, vegetable, and mineral—of the world; for almost all these products, at all events all the most remarkable among them, are to be found represented in Hyde-Park. Not having any intention, however, of trying to solve the problem of making the smaller contain the greater, or of decanting the Atlantic into a pint bottle, we propose merely to indicate the reminiscences of animated nature, as connected with stuffed specimens of birds and beasts, suggested by the Exhibition. We have thought that, amid the countless columns which are being written upon the industry and ingenuity manifested by the Exhibition, amid the unending accounts of processes of manufacture and industrial art, with which the periodical press of the day teems, a paper, leaping from certain exhibited specimens, not forwards to great industrial establishments and singular displays of mechanical skill, but backwards to the productions of that master-worker, Nature—a paper leading the reader from the specimens exhibited, not to factories, foundries, or laboratories, but to woods and mountains, rocks and rivers, would come with a certain freshness upon the mind, and be an acceptable relief from the accumulated and accumulating accounts of the results and the processes connected with the industry of man.

The art of taxidermy is to a great extent misunderstood and perverted. If the mass of the fur or feathers can be tolerably preserved, and something like a rude approximation to the appearance of the living animal be given, the end of the operation is, in the majority of cases, deemed to be attained. We are happy to say, however, that in the Exhibition are to be found several specimens shewing a very different idea of the functions and capability of the art. And we were also gratified by observing in the contributions from Canada a number of well-stuffed birds, labelled as presented by the stuffer to Charles Waterton. The author of "Wanderings in South America" is, indeed, almost the father of taxidermy, as properly understood. We have not at hand at this moment that delightful book of the wilderness, but we remember that it contains an earnest protest against the old plan of stuffing, and a well-merited denunciation of the monstrosities which are exhibited as lions and tigers in too many of our museums. It is of course the heads and faces of the animals which are principally deficient. Not only is all natural expression utterly and irremediably lost, but the lips and nostrils are frequently so ill preserved as to have shrunk back, producing a spectral-like appearance which would have frightened even the original *fera* if he had come across one of his kindred, decorated with such a ghastly grin. In some cases, Mr. Waterton observes, that the head of the animal has been entirely cut off and replaced by a painted wooden block, resembling the original countenance about as much as a ship's figure-head generally does the gentleman after whom it has been christened. Mr. Waterton, if we mistake not, invented a new preservative and antiseptic liquid to prevent the shrinking of the cartilaginous and mucous portions of the face; but what he insisted principally upon, and what we also wish to reiterate, is, that the mere preservation of skin and feature is but a small part of what taxidermy ought to be—that the character, gait, and general air of the animal ought to be copied; and that a stuffed specimen is only half preserved which does not give a correct idea of the habitual gestures and mode of standing of the original. For example, there is the badger, a stout, bluff, sturdy, inflexible-looking creature. What a perfect antithesis is the cat, with its habitual crouch and wonderful air of supple springiness. Contrast the curious pert look of a sparrow, especially if he be a Cockney one, with the more staid and decently reserved aspect of any other small bird of a similar species. The acuteness of the look of some dumb creatures as compared with the dismal fatuity of others, is very remarkable; and if the reader who has not much studied the subject will refer to what we may call the comic character stuffed animals from Wirtemburg, he will see an exceedingly clever exaggeration of the intelligence and shrewdness of a fox's face and of the simple stupidity of a hare's. In this case the artist has

STUFFED POINTER.

STUFFED CATS.—FROM WIRTEMBURG.—FROM A DAGUERREOTYPE BY CLAUDET.

caricatured nature purposely; but nine-tenths of our taxidermists caricature her unconsciously, not by augmenting but by taking no heed of animal expression. How often do we see a stuffed bird, which is nothing but a dead bird placed upright, with glass eyes The habitual posture and characteristic attitude of the creature escapes, as having been too volatile to be fixed by the hand of man. Nothing of the sort, however. Let the reader go to the Transept, close to the palm trees, and look at the "Gorged Falcon:" if he knows anything about carnivorous birds of prey, he will immediately recognise the perfect *fac simile* of the "greedy glede," who has crammed up to the throat, and stands on one leg on the perch, looking as uncomfortable and apoplectic as an alderman who has over-eaten himself. The skilful taxidermist must, therefore, be a naturalist and an observant animalist. Many a man has probably stuffed a dead bird, never having seen, far less studied, the living creature. Such stuffed specimens are mere exhibitions of the feathers, not of the bird; and the skin of the animal, preserving its coat, would be just as satisfactorily illustrated.

Animals, whatever their staffers may say, seldom or never stand in a state of stupid, expressionless inaction. They are almost always watching, and the position of the ears is almost invariably characteristic. Even when they entertain not the least apprehension of danger, and when they have satisfied themselves with food, the expression of listless, semi-torpid enjoyment has its own significance, and it is capitally rendered in the gorged falcon.

Canada affords a fair number of specimens of stuffed birds; and the quantity of skins of furred animals, common to the backwoods and the vast expanse of dreary wilderness stretching towards the shores of Hudson's Bay, brings forcibly up to the memory the wild life of the outlying hunters and trappers, who, with their rifle and their hatchet, pursue for months of unvarying solitude their chase of the animals whose fur is intended to minister to the enjoyment and the comfort of civilised man. Observe those piles of the skins of ermines, martens, foxes, squirrels, beavers, and sables. How eloquently they speak of the vast expanse of North America—the desolate loneliness of its stretching and silent birch forests—the wandering paths of its nameless streams and rivers—of the solemn stillness of its lakes, sleeping amidst the hills—of the stony and bushwooded tracts of its dreary outlying wilderness!

The Canadian specimens of birds are poor. The stuffy hawks, owls, and water-fowl of the diver species. A Mr. Downs is the exhibitor of most of them, and his groups of owls are particularly good. The black, the woods of North America are particularly rich in these nocturnal birds of prey; and in the specimens under notice the great pains attended with praiseworthy diligence to the exact representation of the peculiarly soft, downy, and fluffy appearance of their feathers. These creatures are favourite subjects with preservers; but, somehow, their (literally) eververy expect is never given. They are made to seem as sharp and wide awake as they doubtless are, if we could see them in the dark. Perhaps a peculiar construction of artificial eye would be required to convey the effect; but the study of the shades, the casts, and the transparency, and depth of glance of an eye, is properly the province of the taxidermist, who must instruct the glass-manufacturer accordingly.

Next to the owls, the North American sea-birds attract attention. The specimens belong principally to the larger varieties of water birds—the *Colymbidæ*, or divers; and the *Alcidæ*, or auk tribes. The latter is one of the strangest and most original-looking of all winged things. Watch them in their haunts upon a rocky coast: they keep to reefy ridges, and never patronise a shelving or a sandy shore. With wings no bigger, considering their size, than those with which Cupids and cherubs are decorated in ordinary pictures—with great strong webbed feet, placed, as Sidney Smith said of a tropical insect, where, with submission, the rear tails ought to be—they love to stand as upright as grenadiers upon the pinnacles of rock, just removed from the plash of the surf spray, sometimes making an occasional ridiculous demonstration with their little stumps of wings, as though they were going to fly, or, at all events, intending to convey the notion that they could, if they only thought it worth while; and thus, with their close oily plumage, as dry and tight-fitting to the body as so much leather armour, they doze off the effects of their full meal of fish, caught and swallowed whole in their long dives deep beneath the surface of the sea. The fact is, that, so far as locomotion and the power of obtaining food go, these birds are rather duffers to make a figure among their tribe. They cannot move in the air, except in mere jumps along the surface of the water; they cannot walk on the earth, for, when they try it, they continually topple on their noses—we beg pardon, on their beaks; they got on with tolerable speed upon the surface of the water, and a grey big auk will swim quicker than an ordinary boat will row; but under water is their element. The little wings do good service there, and even the native-born denizens of the sphere—the fish themselves cannot escape the accomplished diver. The fact that all divers can fly, or, to speak, under water, is not generally known; but it is a fact nevertheless. Often have we lain upon a woody bank, all tangled bushes and thick water-plants, watching, silently and securely, the gambols of a couple of water cuckoos in the bright pool below. The fact in question, to the best of our recollection, does not swim, and is not web-footed; but he dives admirably, always choosing a convenient stone or root along the bank as a *point d'appui*, and always using his wings vigorously as he shoots obliquely to the bottom of the pool.

The rock-birds are further represented in their homes and haunts by a curious and characteristic little model in the South-East Gallery, representing the process of robbing sea-fowl's nests in the Orkney and Shetland Islands. The strata, and rifts, and lines in the face of the perpendicular cliff are represented with more skill and natural effect than might have been expected in the handiwork of a fowler. Like the sample-gatherer, the bird-catcher hangs half way down astride upon a piece of wood, supported by a rope, which is kept from the sharp edge of the cliff by passing through the notch of a projecting horn of wood: the ascent and descent of the adventurer being regulated by a species of rude winch, planted, by means of a small rough scaffolding, steadily upon the ground, and managed by a couple of men. The constructor of the model, which is well worth inspection, seems to be a poet as well as a fowler and cragsman. Indeed, his work proves that he labours deftly with his fingers, limbs, and brains; his model demonstrating the first, his occupation the second, and his verses, which we transcribe from a card attached to the work, the third. The stanzas are as follows:—

> This model of rock is intended to show,
> The perils which the birds take for nesting,
> As their nature may be, some high and some low,
> While some in the water are resting.
>
> To take up their eggs from such rugged rocks,
> As may by the model be seen,
> To prevent any danger to which I'm no stranger,
> Invented this simple machine.

Worthy Mr. Hubbard, however, the genius in question, would, we suspect, not find it easy to induce his countrymen in Orkney and Shetland to adopt any safety apparatus of the kind. The northern fowlers are notoriously reckless. A snake or a rope is considered quite safe as all the support which they require for their rope, while a single comrade above is deemed sufficient to manage it, and prevent the warps from being cut through by grating against the rock.

The Fur Trophy in the Nave, in which is collected so marvellous a display of the most highly valued and delicately soft and beautiful spoils from the coats of the animals of the colder part of the world, is, as it were, guarded and set off by specimens of many of the creatures who have yielded up their covering to make adornments for official robes and ladies' dresses. The furs in their mercantile and manufacturing capacities have been already described; we only pause for a brief glance at some of the animals which yield them. These come from most parts of the cold and the temperate regions of the globe. From the shores of Hudson's Bay and the banks of the arctic rivers in America, and from the dreary steppes of Siberia, stretching down to Behring's Straits, on the Asiatic side of the Polar Sea, there, amid the wilderness, dwells the Russian sable, happily unwitting that his coat is worth from three to five guineas. In the rocks and snows of Sweden, and generally in Northern Europe, haunts the ermine, which answers to the weasel of southern lands. In winter he gets as white as the snows among which he burrows, all but the tip of his tail, which remains jet black; and so, then being as it were in season, he is trapped or shot, and his coat stripped to make what the heralds call minevers, and which is the most aristocratic fur in the world, being principally used for high ceremonial purposes of state, and holding the same rank among furs as "regal purple" holds rank among colours. The martens are great fur producers. The hunters know several different species. One, the stone marten, dwells in crevices of rocks, in shingly banks, and in the interstices of ancient caving, grey and mossy, or in the hoary walls and ruined battlements of crumbling castles. He is a great favourer of chinks and crevices, and is trapped or snared as he issues forth for a morning or evening prowl from his stony retreats. The first cousin of the stone marten is the wood marten; he is a forester, burrowing about the roots of pine and oak, and seldom or never stirring from the good green wood.

As home relatives to the tribe of the martens and the ermines, we may class the family groups of the squirrels and the weasels. The former is a capital animal for the taxidermist's art; it is elegantly shaped, and it posse-ses a head with a great deal of shy expression, and has a knack of displaying itself to the best advantage, by sitting upright as it munches its nut. Observe the enormous muscle of the creature's hind legs, which make it the famous jumper it is; and observe the manner in which the tail spreads behind it in the leap, so as to steady the flight of the creature to the wished-for branch. Squirrels are nearly as good swimmers as jumpers. A friend of the writer's, a keen observer of nature, observed a tiny little brown head bobbing away in the water, and speedily found that it belonged to a squirrel on a swimming excursion. With the idea of capturing the navigator, he tried to stop it with the oar; when, lo! the nimble little creature leaped from the point of the blade to the crown of the hat of his would-be captor, and with one jump sprung six feet into the water in the other side of the boat, and resumed his course, never, indeed, having deviated from it for a moment. There is something truly woodland in the squirrel. We associate him with glades and brakes—fine old English words both. He is the privileged dweller in oaks and elms of massy girth and glorious foliage. He is the mortal attendant of the fairies, and is always associated with them merely: for when the King and Queen of Fairyland round the shaven ring, or ride stately by "with bit and bridle ringing," what eye of mortal mould beholds them save that merry black orb which lights up among the oak leaves in the moonlight.

The weasel tribe is well represented in and about the fur trophy. This animal is also food for the craft of the taxidermist. The creature in all its varieties has a litheness and a suppleness of body and a shrewd cunning and quickness of expression about the head and throat peculiarly. A well-stuffed weasel ought to look at the gazer with a "catch me asleep if you can," staring out of every hair from his nose to his tail. The ferret has a peculiarly foxy expression, with a touch of the reptile in the cold bitter of his eye. The polecat, however, is the very impersonation of the ferocious skulker—the very impersonation of cool, artful ferocity, with noiseless step and ghost-like motion he glides into and vanishes in the burrow of a devoted rabbit.

In some sort a connecting link between the great cat tribe and the feline tribe, we have the pole-cat. There is an interesting group of these creatures near the fur trophy, with weaselly bones and lithe limbs. The breed must be disappearing in England, the not very pleasant odour of its skin preventing much pains being taken to preserve the species for the sake of its fur. In the wilder and remoter parts of the Highlands, the pole-cat, under its Scotch name the foumart, still flourishes. The same thing may be said of the brock, *Anglice* the badger, a group of which, a bluff, [illegible] light sort of animal, is exhibited.

Stuffed foxes abound, of all kinds, from our own ordinary reynard who drags his brush across Leicestershire, to the beautiful black and silver fox of Hudson's Bay, and the white fox of the Arctic regions. The best specimen of the preserved animal is, however, the realisation—very well done—of Landseer's, we think it is, clever picture of "Not caught yet." The case is in the Gallery above Tunkey. We have a grassy bank, with weeds and brushwood. Half covered in the foliage lies the trap, baited with a piece of mangled rabbit; but reynard is not to be done. With his quick keen eye tracing the tunny fish of the snare, his nose dilating to the scent of the attraction, and his softly-falling feet in the attitude of a stealthy trot, master fox is the personification of sly cool cunning and suspicion. A wolf in the fur department has evidently been stuffed by some one who never saw or studied the animal. He is quite dog-like. Two cases containing stuffed otters, have been contributed by the Marquis of Conyngham. They are not placed in the best light in the glide of the otter as well caught up as he appears to us in the act of rustling through the sedge to the neighbouring stream. There is no more interesting animal to watch than this fresh-water seal. From some shelf or rock overhanging a deep pool in a mountain stream, or from the bank of a lake, lies salmon round and round the crystal pool, lying in its deep rocky cauldron, green and pellucid, beneath. The hunt seldom lasts long: either the prey manages by a desperate dart out of the pool to make his way into the burrowing cave or hole below, or the otter is not at fault in his element as in deep still waters, or he is pounced upon, dragged to a shelving brink of rock, and the most delicate portion of his flakes—that immediately at the back of his head speedily eaten out; after which, his captor, who as a very dainty gentleman in the matter of fish, leaves the rest for the dogs and the crows.

The only other specimen to which we shall call attention in this part of the Exhibition is that strange animated link between two families, the *Ornithorinchus paradoxus*, which looks something like a small polecat with a duck's bill sewn on to its nose. There are two specimens in the case, one of which is represented in the wood cut, but the creature is like a dunning tailor, [illegible] beast with a bill!

In the Transept, just before the palms, [illegible] is by far the finest specimens of taxidermy in the Exhibition, is that of the Wild Turkey-cock. They are all birds: the plumage is beautifully displayed; the natural tints preserved in all their freshness, and the characters and manners of each proclaim the hand and the knowledge of a naturalist, and the mind and heart of a poet. The Wild Turkey-cock is showing the peculiarities for which the bird was once [illegible] for banquets. The animal itself is a noble specimen of a highly-bred and vigorous kind. He wears his hood upon his head; the hood in question consisting of a close-fitting cap of leather, which completely blinds the bird, and was only removed at the moment of flight. Its legs are manacled by jesses, stout thongs of leather, with which it was bound to the wrist, setting upon the sportsman or sportswoman's hawking gauntlet. The next specimen is called the "Struggle with the Quarry." The falcon has towered above the prey, a fine vigorous heron, swooped down upon it, and with beak and claws struck deeply into the struggling bird; the talons have tumbled, a mere chaos of fluttering feathers and jerking limbs and claws, upon the ground. The struggle is painfully life-like: the heron, with its head and throat torn by the hawk, and the long, red, bleeding flesh seen amid the rumpled feathers, seems calmly jerking his long bill, and attempting with his strong wiry legs to hit off his antagonist, who is tearing him with beak and claws. The convulsive movement of the struggle is represented with great truth; so contorted, indeed, are its members, its pinions, and limbs, that you must look at it attentively before you understand the position of the bird: the fierce impetuosity of the hawk is also very truthfully rendered. Still, like many of Landseer's finest pictures, the group is painful one; indeed, we suspect that it is a blunder in any species of art to represent artificially a fight, which would wound our feelings if seen in reality. Nay, even the keenest sportsman, although he knocks over his game without the slightest twinge of a humanitarian scruple, would possibly not wish to have continually before his eye a vivid representation of the sufferings of the wounded bird.

Close to the "Struggle with the Quarry," is the very clever "Gorged Falcon," which we have already pointed out as a triumph of expression in taxidermy. The stupid, blinking look of the bird—the half shut and dimmed eyes, and the oddly wrinkled cheek, with the indefinable expression of painful helpless repletion which pervades the whole individual, are all very cleverly caught up, and very effectively reproduced. The hawk sits, listlessly and half asleep, upon one leg—the other claw, still red from the slaughter, retracted by the involuntary tendency of the muscles up to the breast. The animal is in such a state that you might almost fancy that a long rest had overtaken him. A very few mighty labour would it be to fly, until digestion has done its work and something like spirit and alertness be restored. Turning from a gorged hawk to a hungry vulture—the stuffed lammergeyer of the Alps is represented as perched upon the rocky jag of a bare mountain peak searching with his fierce, wild, hungry eyes, the valleys and ravines below. The attitude of the creature is very graceful, and full of life and vigour.

Close to the lammergeyer we have a group of black game, nicely arranged; and near it a "scene in the tropics," consisting of a little bank or knoll grown over with luxuriant vegetation all tropical, of course—in the midst of which a collection of parrots and cockatoos, love birds, and some specimens of smaller winged creatures, are perched, apparently gossiping, chattering, and hunting for the gaudy butterflies and glancing lizards, and black shining beetles, which are crawling and passing to and fro. The aspect of the group, plants, birds, and insects, is [illegible], the plumage exceedingly gaudy and rich, and the habitual vacant half-idiotic look of a parrot very well imitated. Still our home birds, whose habits and whose air are known, have more charms than the most glittering of the tropic fowls. A "young leopard reposing" is a clever cub study; the clumsy limbs and coarse bony-looking frame of the creature being happily represented.

The "Dead Gull." We are still in the domain of Mr. Handcock, who represents a bird of the species in question, newly shot and fallen beneath a small withered branch, such as we sometimes see left by the tide, hung with a green drapery of dank sea-weed; the twigs of this forlorn stranded branch serving as a *point d'appui* for the representation, in a swooping posture with outspread wings, of the mate of the dead bird. The attitude of the latter is strictly natural, and the half-closed filmy eyes perfect; while the posture of the sorrowing survivor, seeking as it were to rouse and revivify its defunct partner, is thoroughly expressive of its restless, bewildered grief. The group, in the midst of the [illegible] and dreary picture of "The Widow," and, like that scene of honest animal distress, it is gentle and graceful, but painful. There is no more mock-looking or graceful a bird than the smaller sea-gull here represented. When seen close at hand, this creature is drowsy-like in the meanest of its expression; and the calm, mock look which a wounded sea-gull fixes upon the person who takes it up, has something in it irresistibly, and to our minds most painfully reproaching. In the Gallery in the North eastern Nave is another very carefully preserved representation of a dead gull of the same kind; the attention of the spectator being drawn to the representation of the slight rose-coloured tinge under the wing, which [illegible] the feathers of the living subject, but which [illegible] fades away after death. Some straining or dyeing medium has in this instance been resorted to, so as to make the effect permanent; but to a greater or less extent, however, the vivid representation of dead birds, their feathers rumpled, and their limbs distorted, as they may have fallen to the earth, is foreign to the intention of taxidermy, which is out of dead materials to represent actual breathing life, while the associations connected with the violently killed creatures in question are by no means soothing or agreeable.

We now mount into the inner North-Eastern Gallery, where a considerable number of the specimens of taxidermy are ranged together. The first case which attracts attention, or rather the first succession of cases, have been contributed by Mr. Gardner, bird preserver to her Majesty. As a whole, the specimens are far in [illegible] to Mr. Handcock's. We do not detect that breathing life, while the astonishment connected with the violently killed creatures in question are by no means soothing or agreeable.

We now mount into the inner North-Eastern Gallery, where a considerable number of the specimens of taxidermy are ranged together. The first case which attracts attention, or rather the first succession of cases, have been contributed by Mr. Gardner, bird preserver to her Majesty. As a whole, the specimens are far in [illegible] to Mr. Handcock's. We do not detect that breathing life, while the astonishment connected with the mechanical getting up of the birds, but in respect to the lack of character and sentiment displayed; the want of individuality among the specimens, and the over-crowding together of birds of differ[illegible] and generally chos[illegible] [illegible] [illegible] [

those which that artist delighted to draw. The subjects, however, are disgustingly painful; and, unless the artist meant them to ornament the vestibule of a slaughter-house, we can hardly see what possible destination he intended for his handywork. The largeness of the scale on which the details of the slaughter are represented makes the whole thing absolutely revolting. Two miniature models of similar scenes call for no particular notice. A number of well stuffed hawks are suspended in the air by strings, their wings outstretched so as to imitate the act of hovering. The notion is ingenious, but we fear, that, to be artistically true and satisfactory, every object must have a natural and unadorned, and not an artificial and unmeaning means of support. The groups of owls and hawks with their young are unexceptionable. The falcons feeding their nestlings are excellently managed, with equal picturesque grace and bulk. The attack by the polecats upon the hawks' nest is another piece of dramatic taxidermy; and the gambols of the litter of fox cubs, while old Reynard appears bringing a partridge for distribution among his family, form another pleasing group.

Turning to the *quasi* human animals, we recognise at once the practical exemplification of that old tendency in the Teutonic mind to gift brutes with human intelligence, and to make them take parts in long, and sometimes exceedingly droll histories, just like men and women. Some good specimens of these stories are given in the "Pilgrims of the Rhine." They are not properly fables, but rather half comic, half serious legends, generally full of subdued and characteristic significance, and going in a great degree upon the development of character in the brute *dramatis personæ*. Of these the fox always figures as the scamp of the piece—no doubt, a clever, insinuating, genial, manly scamp, but a scamp nevertheless. See him here devoutly confessing to the cock as a priest, next see him kidnapping the poor unsuspecting hare, of whom he makes a tool to serve some of his private ends. Then observe him contemplatively meditating over the volume in his lap, while he smokes his pipe, the better to digest a puzzling topic. In all these clever specimens of eccentric art taxidermy, the natural cunning and intelligence of the fox's face is exaggerated with very great skill, while the natural simplicity and stupidity of the hare's countenance is just as forcibly worked out. The group of the "Fox and the Hare," *Reinecke* bringing *Lumpe* to Court, is a perfect study. The animals are endowed with the strangest human expression, and yet they are animals still. We have engraved a specimen of this curious style of taxidermy. Observe, the expression being so much exaggerated, the specimens are rather caricatures than real art; but the preserver must *a fortiori* be capable of producing the nicest gradations of real expression in the face of bird and beast. There are a great many other specimens of small animals, and models of larger ones, engaged in human actions, such as a party of tabbies drinking tea, a number of large animals of the weasel tribe as sportsmen, with beaters of a smaller species, hunting an unfortunate flock of hares; weasels fighting duels; frogs walking genteelly out with umbrellas; rabbits trying in vain to do sums on a slate, and cats singing and playing the piano; but our space will only permit our begging the reader on his next visit attentively to study and note the curious degree of skill and drollery displayed in these most amusing caricatures of natural history.

ADORNO'S CIGARETTE MACHINE.

This machine consists of two travelling chains, whose parts are made with great accuracy. Each link is composed of 12 pieces, which are cut out of iron by machinery. One portion of the link is fixed on the chain, and the other portion is moveable. It is necessary that the machine be so nicely adjusted as to the proper quantity of tobacco and paper, and which must be regulated to the thickness of very thin paper.

The machine performs 14 operations:—1. It develops the paper. 2. It moulds the paper. 3. It inserts and presses the tabacco. 4. It regulates the amount of tobacco. 5. It brushes away the tobacco in excess. 6. It cuts the paper and divides the cigarettes. 7. It prepares the cigarettes to be folded. 8. It folds the cigarettes. 9. It transfers and finishes the cigarettes. 10. It prepares the ends of the cigarettes. 11. It finishes their ends. 12. It sends the cigarettes arranged to be packed. 13. It regulates the number of cigarettes. And, lastly, it cleans itself.

The machine makes and finishes the cigarettes with greater neatness and perfection than by manual labour, and the economy of labour is so great, that, solely in this respect, the price of the same manufacture by hand labour is wholly saved. More than eighty cigarettes may be made by the machine in a minute. Paper of the proper width and thickness is caused to pass over one of the travelling chains, consisting of lines of rods, ending with the seantling of the cigarettes. When the paper has a sufficient number of indents, fine tobacco is put into them, and the waste falls into a trough beneath the machine. As the chain on which the paper is first placed moves forward, a knife, by means of an appropriate movement, divides the paper into the length of the cigarettes, which are finally folded entire, by passing to the other travelling chain; and by pressure from above the cigarettes are completed ready to be removed from the machine. In the English market there is scarcely any demand for cigarettes, but in Spain and the American republics its importance is great. This will be better understood, when we state, that, in Mexico, 6,000,000 dollars worth of cigarettes are consumed in the course of a single year. The consumption of cigarettes in Spain and Havannah is proportionably greater. This cigarette machine is seldom worked at the Exhibition, as the materials (principally tobacco) are of an expensive kind; and, as the machine would convert a hundred weight of tobacco into cigarettes in a single day, too much expense would be entailed; but coloured cigarettes, as suggested by an ingenious friend who was looking on the other day, when we had an opportunity of seeing the machine in motion, would answer the purpose very well.

LETTERS FROM LONDON
ON
THE GREAT EXHIBITION AND OTHER MATTERS
BY PELEG E. WHEELER,
WITH AN INTRODUCTION BY BAYLE BERNARD.

(Continued from page 31.)

LETTER VI.—TO DEACON BIGELOW, AGAR-HOUSE, COOK'S FERRY.

THE OPENING DAY; MODERN PROPHECIES, THE GLASS-HOUSE SYMBOLS AND DEFECTS; THE LION'S WALK; THE LONDON STREAM; HIS SEIZURE AND RESCUE; AND ULTIMATE DELIRIUM!

RESPECTED FRIEND,—

The opening day! Here it's come, and that's a fact—roll'd round to us at last, as sure as the best spoke in a wheel, or mid-day on the clock. Here it's come, as it was bound to do, out of a sky as clear as truth and as soft and pure as childhood; come, bright and kind, and gentle as the first love we loved to look at. The stars know'd what they'd to do—they watch'd over it all night, keeping clouds from it and cold, and delivering it up to us at dawn, bright and balmy as beloved it. I guess that morning was bespoke, it could scarcely have come by accident. It was Natur's contribution to the Great Show of the day—Natur's proof of her own sympathy in a cause that must make our speshy git suthin' of her own spirit, and larn at least to watch her laws; nothing of extremes about it, neither hot nor cold, but well balanced, of even pressure, and, in short, a good embodiment of the progress it relates to. The opening day was just the day, Deacon, that you or the Doctor would have wished for, and thought properly significant of the great affair in hand. And there's suthin' in the name too. Han't the "opening day" a sense in it as strong as opening flowers? Aint it stretched as tight with meaning as a gooseberry with juice? It's true the Doctor tells us there's nothin' in a name, and he quotes a big authority—nothin' short of Shakspeare; but I reckon the world of his time wasn't quite as spry as our'n—wasn't scarsly as well awake as the locomotive ery. All his genius couldn't help him to paint the reign of steam, or dream about the telegraph. Now, I say that names are things, or, what's next to it, they are the skins to 'em; and I reckon you'll mostly find that a great fact has a great title: and aint the "opening day" a proof on it? Don't it speak of suthin' more than jist unfolding warehouse doors? Don't we think of grander openings—openings of thoughts and feelin's; openings of human intercourse, of social truth and progress, of light, and peace, and freedom;—to say nothin' of the opening of the eternal let of mouths which this morning went to work like so many high-pressure engins?

Yes, the day is come, Deacon, notwithstandin' the thousand fellers that swore so hard it couldn't—and couldn't, for all I could learn, jist because it ought. Nothin' is so onconceivable to some folks as a great good. The Almighty must perform a miracle to take care of his own critturs. Now, misery comes to us nat'rally—that's the thing we're born to. and some will tell you it's a sin if we endeavour to avoid it; that it's agin the command of Scriptur; that it's rank wickedness to take chloryform to diminish nat'ral pains; or to reap wheat without perspiring, if you live in ever so cold a country. That's the usual way. I reckon, truth has allers been disfigured by poor stoopid mole-eyed critturs taking the letter for the sperit. But, for all that, the day is come, Deacon, notwithstanding the gloomy faces, and the heavy-hanging forebeard that looked like rhymed pumpkins too heavy for their stalk; that raelly seemed so full of fruit they were a'most on the pint of burstin'. Notwithstandin' all their droopin' and their terrible foreboding, and their fears of a big calamity, and their sartainty of the sin, here the day is come in spite on 'em, to teach 'em better doctrine, and show it wasn't the Pagans only that were troubled with false prophets. Here the day is come, without conspiracy or pestilence, or the least mite of commotion, except in people's hearts—in kindly thoughts and wishes, and a proper heap of expectation: and this leads me to see a principle, which I reckon might be useful in our futur' calkylations, might help us to construct a sorter social almanac; and my principle is jest this, that whenever a good thing is going to happen, it's allers sure to be call'd impossible; and the greater the amount of benefit, the greater proof it won't turn up. Take our centry as a proof. When, forty year ago, it was proposed to light the streets with gas, warn't that proposal called impossible, tho' the year afterward it happen'd warn't it said to be an attempt to blow London into shivers, to put a volcano into pipes and have a vent at every door—twenty thousand eruptions all going off at once? Then agin in regard to steam; warn't we told that it was impossible that steam should cross the ocean, only six months afore it did? Warn't it larfed at as a lunacy, jist as the Arctic got afloat? And agin in vaccynation, when there was a sorter human murrain, thinning the English off like cattle, and 'twas proposed to check its ravages by weakening its attacks, warn't that too called impossible, and wuss than that, quite impious—trying to make people live when 'twas clear they were intended to die—when they were falling in a pestilence that was plainly the will of Heaven? And so in regard to the World's Congress; that was as mad and as bad as anything, tho' here it's come to pass, and with no greater amount of evil doers than teaching us to be friendly, and to live by honest labour. So I affirm it as a rule, Deacon, that whenever a thing is to be good and declared to be impossible, you may be as sartain as the sun that it's going to happen instantly.

Yes, the day is come, Deacon, full charged with light and cheerfulness; and if there's a roof that gets its share on it, I guess it's the World's Warehouse—that covering for all the wonders of human skill and energy, and yet the biggest one itself;—England's grandest contribution, show what she may inside—a most uncommon proper casket for the gems of good King Industry. Now, I aint told you what I thought on it—what was my first and best impression when I haff'd up to its side; and if you would like to know it, I must tell you that I wouldn't lose my balance, whatever was the preshur so in order to that end I sot right down afore it, with my back agin a tree, and took a'most two hours to come to a conclusion, and the pint I reach'd was this—that that house is nothin' short, Deacon, of a picture of human progress; that there' a meaning in every joint of it, and in every inch of windowpane; that from the basement to the roof on it, from the doorway to the crown, it shines out as the embodiment of an everlastin' truth. Take its substance, glass and iron, and what do these two signify? Aint it strength and cleanness? and aint these the very qualities that our speshy needs the most? I want to know if there's a darn'd thing bigger than the little eend of nothin' of our making any progress without we're equally strong and honest? Then agin, its figger; just reflect a bit on that; low and well set for the most part, taking a firm grip of the earth, and not narrow, weak, and lofty, as if 'twas a thing too good for it; and I'll jist ask agin, if these aint more of the proper elements—humility and prudence? Whilst as modesty is allers not only a source of strength but beauty, see its top rounding off into a brow of grace and spiritooar, lifting up to the smiling heavens its thousand eyes of gladness, as it drinks and radiates their light like a hugs diamond in the sun. That house, I say agin, Deacon, is a symbol of our speshy; and if they ever think to pull it down, I shall vow we're tumbling with it.

And so you'll guess, of course, that about my happiest hour in England was jist that that brought me up beside it, and you wouldn't be far wrong; but no happiness is perfect, Deacon, everything in this world has a'most to make us wish for more, and so, out of our discontent, raise a sufficient supply of energy. And so, agreeably to this law of natur, I felt that the Great Warehouse was deficient, and had two or three big stains on it that curdled my comfort mightily. I'll jest name 'em to you, Deacon, that you may see I aint grown an Englishman, and have my grumbling jest as nat'rally as swallowing fog and porter. In the first place, they put up afore the door on it the figger of a fighting-man, a great warrior on horseback, who spent his life and lost it in slaughtering his fellow-beings, and, just sitting, as he might do, calm and thoughtful, as one would hope, at the door of such a building as this, he'd put up in the air, stretching out a long sharp stabbing-iron, as tho' he was going to work at once upon the bodies of the visitors, or was holding up his plaguey broadsword as a sort of devil's cross—for all the world to worship it. Now, aint that suthin' shocking? to offer a child sticking up such a figger, the sign petrific and bloodshed, afore the doors of peace and amity; unless indeed it's meant to show the great purpose of the building,—to put the past well out of doors, whilst the future lies inside of it. tho' in that case, I conceive, seeing folks are so plaguey stoopid, the fact should be deeply printed and hung on the horse's nose, or sot, that they might look at it in the paper spere—not to labour but avoid it—just as boards serve on the ice to tell us when it's dang'rous.

But there's another point to mention. I regret to tell you, Deacon, that the spirit of fraternity and sister hood is out, and that it happens to be the commodity in which the show is most deficient. The flags of every country waving and mingling on the top are a proper emblem of the feelings that are uniting all about it; but once you get inside, I guess you'll find that prejudices stand as distinct as the several counters. This aint the proper moment to discuss the matter fully; and arter the support I've given the critturs, 'taint for me to run it down, because some folks have used me shameful. This is the common course, I know, but I aint going to be so mean; so I'll pack the case in a few words, and throw it in a corner. They've refused my contribution—I vow if 'taint the fact; neither my sausage-trap nor skull-cap are to be found in the Exhibition; and you see I aint the man now till no time before you'd larn the reason. In the first place, it's a pint of order, because I didn't lump 'em up with the gin'ral American contributions, which was of course to acknowledge that mine warn't at all superior; and 'twas likely To say that now, warn't it? And next, would you believe it, because they say they couldn't find room 'em, couldn't tell under what head they were to go into the catalogue—whether the practical or the fine arts. Now, since the hour you were raised, Deacon, did you ever hear such proper gabble—such an onconsist lot of braying, except from critters dooly qualified? Practical or fine arts! as if they warn't the two together, and I had any notion to show that this is jest their grand distinction. But there's a wuss complaint to come; I pass over my own wrong, I go on to the public's, and that's one you'll never guess if you could calkylate as well as the whole state of Massachusetts. This building, that invites the entire world to stock its counters, aint a free one arter all; it's free to goods, but not to men. It throws its doors open, it's true; but says you must pay to enter them! What do you think of that, Deacon? This great Fraternal Building to become a commercial spekylation—not a focus for the diffusion of a moral influence throughout the world, but just a counter over which to take a lot of the world's money; a spot to sell the social benefits it preaches up so grandly, and to call on furreners to pay for a handsome ornament to London! Now, I want to know if such an intention aint a blot on the hull project, aint a downright dab of dirt on it? To tell strangers, who send their goods and bring their persons to this capital, and so pour a flood of money thro' every channel of the country, that they must not only pay for show-room, but, when the show is over, leave the building that they've help'd to raise as a present to the country! Now, aint that a clever way of getting architectur cheap? I want to know what they'd have said, if we Yankees had done that. Wouldn't the papers have come out a spell on our calkulating natur, and our love of the main chance? I guess this aint the first time that good old Mother England has done the very thing she sees so wrong in her son Jonathan; and s'posing he did it arter her, just in a spirit of filial reverrence—oh! wouldn't she become disgusted, and put the cow-skin to him properly!

But now to detail the event, Deacon, the great business of the day—the opening of the flood-gate to the stream of all humanity. The morn' g, as I told you, turn'd out to be first chop, as good as if bespoke, made to order in Indiana, and sent across for the occasion. Well, you'll guess that in our garret we warn't inclined to oversleep ourselves; even if we wanted expectation, we hadn't too great a stock of air, and our mouths were forced to open, whether our minds were closed or not. Besides, as my friends happened to be all on 'em revolutionary, 'twas nat'ral, of course, that they should rise at the first moment. But here I've got to note a most uncommon want of deference, a piece of ignorance or neglect, that I consider downright shameful. Notwithstandin' the great occasion of a morning such as this, I'll be skinn'd if 'twas honour'd by a single grain of powder! There warn't a gun or e'en a cracker by way of noticing its dignity. Now, in America you know we allers think a celebration is entitled to a messenger, and we send some guns afore it, to tell people to look out. It's a notion among us, that's putting guns to their true use; that, as they happen to have long throats that can speak to thousands at a time, to make 'em give the signal for hoorahing to the public—to pitch the key of a grand chorus—is about their proper eend, and a way to make 'em minister to the public good instead of misery: so I need not tell you, Deacon, if this is "opening day" had only been with us, what an eternal lot of thunder we'd have got up for the occasion. We'd have made noise enough, I reckon, to have raked some clouds together, and perhaps induced them to have helped us to a flash or two of lightning. But what was the fact here? why there warn't report enough to skeer a rabbit, or set a spider swinging! There warn't, as I could hear, e'en a tune played on a trumpet. Tho' there are chaps here, I've been told, in some of the big bands, who could blow a French horn out of curl, there warn't a puff of wind from one on 'em; and the neglect was the more mindful, seeing the public hadn't received the usual notice from the weather; for that's a fact I've got to tell you, Deacon—that there's allers one grand featur of an English celebration, and that's an all-fired lot of wet; whenever there's a holiday or rejoicing, or any "come out" whatever, sure as a rifle comes the wet, and the wet in downright arnest. If it had been drizzling days before, or e'en coming down occasionally by the handful, or pailfull, on a celebration day it seems to feel an extry stimulus, a sorter call upon its energies, and down you have at them—give the entire tub! and yet, strange to say, to-day, Deacon, the heavens were quite clear, even the sky seemed to respect the great event about to happen, and, in order to ensure a proper harmony, resolve on making the human sunshine a sorter double of its own.

Well, as soon as breakfast was over, which was right early you'll believe, and I s'pose I needn't tell you was particular fraternal, I borrowing a knife or teacup from my French and German friends, and they, in the like spirit, borrowing my butter, loaf, and sugar;—I dressed myself right off, and set off on a sharp walk, afore the Palace doors were open'd, jist to note the look of London and the state of things outside the building, afore I gin my ticket and went in. Well, you'll 'spose the streets that mornin' warn't quite a pictur' of a prairie;—warn't as empty and as silent as the mammoth caves of old Kentuck. If they were ever meant for human akyducts, I guess they then fulfilled their end. As I've said to you already, Deacon, it's only a feller who has lived West and seen its style of rivers, that can form any notion of the noise "stream of London; and he must have been there in the spring too, and seen 'em swollen by snows and freshets, to fancy such a flood as I beheld this morning. 'Taint no use to describe it, Deacon, and so I shall hold off, and jist tell you what I thought was the wonder next in size to it. That was the gals, Deacon, the gals—the crowd, and look, and gear on 'em;—almost two to one to the men, and bless their hearts, in point of looks, worth four to one at least; such an everlasting lot of bonnets was outside of all arithmetic! I don't believe they were ever dreamt on by all our manty-mak ers on a hoar; and as for the faces under 'em, and the figgers they belonged to—ah, I want a better tongue, Deacon, to give you half a thought of them. You know I'm a high-tariff man, and go for home-made articles, and I reckon that our Eastern gals aint the worst of living samples: but the truth is still the truth, whether its taste is sweet or bitter, and the fact can't be denied, that the gals here are the jam—first chop, and nothing less. Such bright hair, and rosy cheeks, and round, springy, little figgers, I vow if there ain't some on 'em that look good enough to eat. They ought to make a feller's fort'n if he could git 'em for a bar, jest to taste the slings on mixing 'em, and so save the need of sugar. And here, to see 'em by the thousand, not in couples but in droves, and in rows, and straight, and round, and nicely rigged as the mast of a new schooner; in all manner and sorter notion of the most dreadful pretty dresses, white and blue, and green and yeller, with satin bunches in their bonnets that looked as slick as mushrooms, and ribbons long enough to moor a fleet of whalers to the Pole. And there was suthing more than that, too; there warn't only their bright faces, and happy, well-filled hearts, I guess their arms were filled as well; they brought no eend of babies—the most awful pretty toads you ever clap'd your eyes on—little, staring, springy critters, that seemed to take quite an ironical feeling, wanted to go ahead like others, and no wonder if they had, for they had been accustomed to high treasure. Those babies were a sight, Deacon; in the great show of the day they were the mothers' contribution, and I vow I thought it hard there warn't a counter to display 'em.

Well, after I'd got tired, I tried to steer, on an eastern and southern cruise, before I huffed and bore away for the great haven in the Park; but, arter what I've told you, you'll guess with what success. Every move was agin a tide that every moment was gitting stronger, thickening up from every street and doorway that fed the leading channel, till at last I was fairly wedged, Deacon, caught fast, and swung about like a skiff or a canoe that you try to paddle up a mill-race; and once I got agoing, there was no help but to go on, and so the great flood carried me, till I found myself brought up agin a tree in the big park, when you may s'pose I threw out my irons, and for a spell or so made fast. But rarely I soon found there was a bigger need than that, to hold on to life itself. In less than half a minute I felt like cotton in a screw—as well packed as the middle cod fish in a barrel from Cape Ann. What with the stomac of one feller, and the elbows of another, I got crooked like the letter S, and really begun to think I should want a garden-critter for to put me straight again. And just at that moment, to put a moral in the matter, there came a cloud across the sky and a little dash of rain, to make us mindful of the mixtur and ensartainty of happiness; and I thinking this was the beginning of the usual public weather, why I got a little skeared, for, says I, if here I stick, and that fast

as like a feather in an eddy, whirl'd round and round onceasing, and carried here and there without power to move, or stop, or hold on as I liked: I found myself in the middle of above twenty thousand people, all scutling about for places, and not at all the wust ones; and I s'pose it wouldn't have stopp'd all day, but that all of a sudden the doors were closed and the police sung out "the Queen," and then "to places" was the word, and in less than half a minit the scrambling was all ever, and the great, hurrying, whirling current became a solid body, and stood as still, and pale, and silent as tho' it had suddenly got frozen by some new great force of chemistry; and, as good fortin chose to have it, I was one of the particles within sight of the Royal platform—in what they call the Transept, right afore the chair and canopy—tho how I got there, marsy knows, and two of the policemen—and having this position, the very best in the whole building, you'll naterally expect me to give an account of all that happened—to give a full and clear detail of the hull inaugurating sarrymony. Well, all I can say is this, Deacon, that when I looked up and saw above me that gorgeous arch of glass, that seemed to be hung up in the air, as a bridge for the feet of angels, and when I view'd the very beings, angels themselves, by thousands, young, and pure, and beautiful, in their white and shining dresses, bending over the great galleries or lengthening out in lines below, with looks that seemed only made to shine with praise or mercy; when the sun too burst upon 'em, as tho' the heavens at that moment were smiling down on their lost tenants, and the great organs began to play the grandest mammoth kind of music, and the excellent Queen herself came to take her seat among her sisters, as the pattern of the [illegible] and the chorus then burst [illegible]

Your respectful and affectionate
PELEG E. WIBBLER.

(To be continued.)

GROUP OF ARMS, &C.—BY G[illegible]

GROUP OF ORNAMENTED ARMS, CUP, &c. BY GUEYT[illegible]

M. Gueyton's display of artistic silver-work is very splendid, and its examination will gratify a higher taste than that of mere idle curiosity. This exhibitor also pretends to a new and improved method of electro-plating, by which the expense is much lessened, leaving, necessarily, a larger proportion of the price of the article produced to reward the labours of the designer and fashioner. The group of objects which we engrave comprises a variety of sword-handl[illegible], in gold and silver, most admirably decorated with sculpture and engraving, and chasing and precious stones, in various manners; a dressing-case, of pure *Renaissance* style; and a prize cup, or racing plate. The last-named work is extremely interesting, the subject being most appropriate and happily chosen, and the execution in the very best style of art. It represents, as will be observed, the principal phases in the history (natural and educational) of the horse: the three principal being the ancient chariot-race, the mediæval tournament, and the modern race—"the race" *par excellence*. In the intermediate spaces we see the interesting quadruped first as a colt by the side of his dam; next in the stable; and in the last place, proudly bearing his master, a gallant cavalier, across the country, probably to the wars. In the centre is a group representing the education of Achilles by the Centaur.

THE ILLUSTRATED LONDON NEWS.

No. 506.—VOL. XIX.] SATURDAY, AUGUST 2, 1851. {TWO NUMBERS, 1s. WITH HALF-SHEET SUPPLEMENT, GRATIS.

THE TAXES ON KNOWLEDGE.

THE Select Committee appointed by the House of Commons to inquire into the operation of the law which forbids the publication of newspapers without a stamp, have presented their report. They have been for some months past occupied in collecting evidence on every branch of the subject, and appear to have conducted the inquiry with ability and fairness. The result is a condemnation of the tax on all the usual grounds on which it has hitherto been attempted to justify it. The report discloses no new facts, and states no arguments against the Stamp Duty, which were not previously known and employed; but it possesses the merit of concentrating these facts and arguments, and of putting the whole case in a clear, strong, authoritative, and convincing manner.

The taxes on knowledge are twofold: the first is the Excise duty upon paper—a subject to which the inquiries of the committee did not extend, but which it is desirable to keep constantly fresh in the recollection of the public. Our opinions upon it have been more than once expressed. The impolicy of taxing such a commodity is so generally acknowledged, that the abolition of the duty, and the consequent freedom of the paper manufacture, is only a question of time. Whenever a Chancellor of the Exchequer shall be found wise enough to imitate, as regards paper, the example set by Sir Robert Peel, with such brilliant success as regards glass, there will be no fear that Parliament will interpose its veto between him and his good intentions. If the officers of the Excise have not been already relieved of their mischievous attendance upon the operation of paper-making, it is solely due to the incapacity or unwillingness of Sir Charles Wood to devise a comprehensive and statesmanlike Budget. The doom of the tax has been pronounced by universal consent, and its continuance rests upon no argument stronger than that which our financial ministers are so fond of employing—that money must be procured somehow. Such an argument, when applied to taxation that impedes commerce and industry, and affects the health, morals, and social improvement of the people, will not continue to be tolerated.

But the impolicy and injustice of the second of the two taxes upon knowledge—the newspaper stamp—are not so generally understood or acknowledged. Many persons who think the interference of the Excise with the manufacture of paper to be injurious to trade, and who have no objection to the cheapening of paper generally, and of books particularly, are yet of opinion that the newspaper stamp has the effect of preventing the dissemination of false, seditious, or immoral doctrine in the newspapers;—that the tax "keeps newspapers respectable," and that in reality the stamp is not a hardship either upon the public or upon the proprietors of newspapers; inasmuch as by its means the public is privileged to receive, and the proprietors to send, newspapers free by post in all parts of the country. This class of reasoners will derive much instruction in perusing the report of the committee. No person who coolly and impartially considers the arguments used in this able document, and weighs the facts by which they are supported, can fail to admit that the newspaper stamp duty is, to say the least of it, a mistake, and that the sooner it is abolished, the better.

To tax news merely because it is news, is absurd as well as impolitic; for no Government can really have an interest in the ignorance of its people. But the absurdity of the tax becomes still more apparent, when it is known that the law authorities of the Government cannot strictly define what they mean by news. To use the words of the Report, "the Secretary of the Board of Inland Revenue states that a paper containing nothing but records of proceedings in private families, and calumnious insinuations as to the conduct of individuals, is not liable to the stamp;" but that a paper which should, without a stamp, publish the Queen's Speech on the opening of Parliament, would be liable to a prosecution. Falsehoods, libels, blasphemies, and seditions may be, and often are, published by periodicals that make such matters their business. Whatever impediments may be thrown in the way of such disreputable publications, the stamp duty is not one; for falsehood is not liable to the duty, nor libel, nor sedition, nor blasphemy. But when a newspaper publishes facts which it is of the highest social importance should be made known—when it sends its intelligent reporters to the galleries of the two Houses of Parliament, or despatches its active and painstaking correspondents to the remotest ends of the world, to gather commercial and political truths, the dissemination of which is a public necessity and benefit, it is taxed to an extent sufficient to withhold such information from the poor. No doubt, one of the original intentions of the Legislature, in imposing the stamp duty upon newspapers, was to have some sort of a guarantee, that publications, possessing such power for evil as well as for good, should not be established by irresponsible parties or mere men of straw. Yet it seems

OYSTER DAY.—"PLEASE TO REMEMBER THE GROTTO."—(SEE NEXT PAGE.)

equally beyond a doubt, that in this respect the Legislature made a mistake. The stamp does not prevent irresponsible parties and men of straw from punishing lies and libels; and, in the case of the great leading daily and weekly newspapers, provides no security that would not be afforded by the proprietors of such journals if no stamp existed. To carry on successfully a great speculation like a newspaper, daily or weekly, a man must conform to the usual rules of trade and commerce. He must pay his way, he must be known and respected, and he must be responsible for his words and deeds like other men, who expect to prosper and hold their position in the world—all of which he would be obliged to do to ensure his success, if no such impost as a stamp had ever been dreamed of. That the *Times* or the ILLUSTRATED LONDON NEWS would be less scrupulous in avoiding attacks upon private character, less moral, less religious, less intelligent without a stamp, than with it, will hardly be asserted for a moment; or that any rivalry to these journals, which should be established were the stamp abolished, could compete with them more successfully by publishing libels, by attacking morality or religion, or by pandering to the ignorant or the vicious, is absurd to imagine, without at the same time taking it for granted that the English are a bad and degraded people. The stamp is no impediment in the way of those who wish to print such things as these; and if the English are so bad and vicious as this hypothesis would make them, there ought at this moment to be an immense circulation of such inferior and abominable publications. But this is notoriously not the case, and destroys the whole argument of those who insist upon the stamp as the means of keeping the press respectable. As a rule, the press of England is respectable, because the people are so; and if any stamp, in the default of other means, could keep it so, it would not be the present stamp, which is a tax upon truth.

The justification of the Stamp Duty, which is based upon the free transmission of newspapers by post, as a return made by the Government for the penny which it levies, will not stand investigation. It is quite as untenable as the other argument. The transmission by post is simply a question of arrangement. If the Government will treat newspapers as it does letters, and only charge for the transmission of such as actually pass through the Post-office, it will put the matter on a proper basis. At present it justifies the tax on a false pretence. Not one tithe of the newspapers published are transmitted by post; and, of that tithe, it may be safely said that the greater portion pass, half a dozen or a dozen times, through the Post-office. As regards revenue only, the State would, in all probability, not lose a farthing by the abolition of the Stamp Duty, if it made each newspaper pay a penny every time it was consigned to the Post-office. But on this point, when the question comes before Parliament, we apprehend there will be no difficulty.

In the concluding suggestion of the Committee we heartily concur. It is probable, if the trade in newspapers were thrown open to all the world by the abolition of the stamp, that a class of newspapers would be started which would pirate the information, procured at great cost by such journals as the *Times*, *Morning Chronicle*, and *Daily News*. To remedy this evil, the Committee recommend a limited copyright. We doubt whether, under the present state of the law, the morning journals, with great expense, can supply most of the domestic and foreign news, could not prevent the evening and weekly papers from coolly appropriating to themselves the fruits of their labours, in most instances even without the niggardly honesty of acknowledgment; but it will probably be more advisable, when the question of the stamp comes to be discussed in Parliament, to declare a copyright for a limited period, as recommended by the committee, than to leave the great journals to the chances of the existing law.

Upon the whole, the country is greatly indebted to the committee for the document which they have presented to Parliament; and the approaching abolition of the unwise enactment, which they met to consider, will be due in no inconsiderable degree to its well-considered and impartial report.

OYSTER-DAY.

MONDAY next will be "Oyster-day," or the day on which oysters are first brought into the London market at Billingsgate. Upon the preceding page our Artist has pictured from his sketch-book a clear and true scene from this red-letter day of the London poor. Let us glance at the incidents of the groups of which the picture is composed.

The Oyster-day has arrived; and a very busy day it usually proves for Mr. Mayhew, in his "London Labour and the London Poor," tells us that "the number of oysters sold by the costermongers amounts to 124,000,000 a year. These, at four a penny, would realise the large sum of £120,650. We may, therefore, safely assume that £126,000 is spent yearly in oysters, in the streets of London." We will not pursue the calculation into how many grottoes might be built from the shells of a year's supply of oysters, but come at once to the pile the boys in the left-hand corner of the picture are raising. The coming-on of oysters is observed as a sort of festival in the streets; and in such a nook of the metropolis as the present locality, the grotto is usually built of inverted oyster-shells piled up conically, with an opening in the base, through which, as night approaches, a lighted candle is placed within the grotto, when, the effect of the light through the chinks of the shelly cairn is very pretty.

It is but fair that the young rascals should be rewarded for their trouble; and, accordingly, a little band, of what some churl may call urchins, sally forth to collect pence from the passers-by; and the usual form of collecting the tax, by presenting a shell, is shown in the next group. The old gentleman is pondering his displeasure at the request of the applicants, whilst his daughter regards them with a genial smile. We wager that he will drop his copper into one or more of the suppliant shells. Let us hope that he will not turn his back upon this cheap *extraction*. The children are in high glee, although one of them has shoeless: perchance, in the comic vein of the age, they are bent upon quizzing this mode of collecting "salt" for their oysters.

The third group remains to be noticed. The grotto-builders have wisely taken up their ground near an oyster-stall, thus bringing supply and demand closely together. At this street-shop a coal-heaver is the customer, and an old woman, who has "seen better days," is the vendor.

Mr. Mayhew relates, with quiet humour, some of the experiences of these street oyster-eaters—how their customers are "all sorts:" how "two-pen'orth is a poor gentleman's dinner;" how some persons buy "two-pen'orth instead of a glass of gin," &c. "We see a deal of the world, sir," says one of the sellers—"yes, a deal. Some, mostly working people, likes quantities of pepper with their oysters in cold weather, and say it's to warm them, and no doubt it does; but frosty weather is very bad oyster weather. The oysters gape and die, and then they are not so much as manure. [illegible] I clear [illegible] a day, [illegible] the commencement [illegible] the fine with the wet days, and the weak days with the Sundays, though I am not out there, but, you see, I'm known about

THE COMMANDER IN CHIEF IN INDIA.—From Simla, under date May 20 we learn that Sir W. Gomm, while taking his usual morning ride a few days previously, was accosted by two discharged Sepoys, who rushed out and seized his pony's head, loudly demanding "justice!" They kept their hold until a European person, who was happily at hand, came to Sir William, rushed to the rescue, and knocked one of the men down, when the other released his hold. Sir William is said to have had a narrow escape of falling over the precipice, at the sudden appearance of the men startled the pony so as to render the position of his rider dangerous

OCEAN STEAM NAVIGATION.—M. Cores De Vries is now at Batavia, making preparations for carrying out his contract with the Net erlands Government. He expects two steamers before the end of the year, one of which is to work to Padang, and the other is to be stationed on the west coast of Sumatra

Mr. Abbott Lawrence, the United States Minister at the court of [illegible] tested last his son, Col T. B. Lawrence [illegible] owned [illegible] of Mr. Colt's American revolving [illegible] pistols, for the use of an officer [illegible] He, for the use of an officer [illegible] necessary have given direction to [illegible] pistols to be removed from the Exhibition Building, and delivered to C[illegible] Lawrence as requested.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The Legislative Assembly has determined to take a little relaxation from its labours.

On Tuesday last, a motion for prorogation from Aug. 10th to Nov. 4th was agreed to, after a division in which 420 voted for, and 232 against the proposition. It was then unanimously resolved to elect twenty-five members as a committee of Permanence, to sit at certain periods during the prorogation. M. Creton recommended the Assembly, that his proposition for the repeal of the law of banishing the two branches of the Royal family stood for the 11th of September; but, as the Assembly would not be sitting at that time, he should move that it be fixed for Monday next. Motion rejected.

On Wednesday a bill was introduced in the Assembly, to continue the censorship on theatres for another year. Some opposition was offered to the measure, but it was ultimately carried by a large majority.

During the past week workmen have been engaged in preparing the Hôtel de Ville for the *fêtes* of the Exhibition, which commence to-day (Saturday). The court of Louis XIV. has been converted into a garden, and the statue of the "Grand Roi," which was in the centre, has been taken down from its pedestal to make way for a handsome fountain. Full-grown trees are planted at the corners of the court, and the gallery has been decorated for the banquet of 500 covers, which is to be served by Chevet, of gastronomic celebrity. Expeditions have been undertaken into the provinces to cater luxuries for the distinguished visitors. The meadows of Normandy have been ransacked for the finest oxen. A prize ox is to be served whole, in order to gratify the British relish for roast beef. The *garde meuble* of the state has opened its stores to the Prefect of the Seine to furnish the most sumptuous gold and silver plate. Immense numbers of lustres of rock crystal are to be suspended from the ceilings.

The military spectacle on the 6th instant is intended to be much more than a simple review of the army of Paris. A series of brilliant manœuvres are to be performed in the Champ de Mars, and on the heights of Trocadero. The artillery are to throw a bridge over the Seine above the Pont de Jena. Arrangements have been made to enable as large a number of people as possible to have a good view of the operations.

The solar eclipse was observed at Paris under very favourable circumstances on Monday, the day being bright and sunny, and the sky almost cloudless. At half-past 3 o'clock P.M. the moon's surface appeared like the crescent moon, two-thirds of its surface being hidden; and at this time, and for nearly an hour previously, a singular gloom prevailed; and at the moment of greatest obscuration, the sun was surrounded by a luminous rainbow-like aureole, forming a complete circle of about 100 yards in diameter to the naked eye.

The law officers have reported that the charge made some time since against a member of the Chamber of Deputies obtained a station for a friend upon condition of sharing the salary, is entirely without foundation.

The *Siècle* has been seized for containing a vile calumny upon the President of the Republic, insinuating that he is much embarrassed, and that he has had to pay some debts contracted at the Elysée which were not his own. The author and the publisher of the libel are to be prosecuted.

M. Carpentier, editor of the *Republique des Campagnes*, has been tried, found guilty, and sentenced to six months' imprisonment, for publishing a seditious article.

The anniversary of the Revolution of July, which placed the late Louis Philippe on the throne, was celebrated on Tuesday, in Paris, at the church of St. Paul. A low mass was performed, and afterwards a few crowns of *immortelles* were deposited at the foot of the Column of July, on the Place de la Bastile. The commemoration was a very cold affair altogether.

UNITED STATES.

We have intelligence this week from New York to the 19th ult.

A rumour of Mr. Webster's resignation of the post of Secretary of State had obtained some credence, but proves to be unfounded. Mr. Webster, however, will retire from the cares of office for a short time, in order to recruit his health.

The diplomatic proceedings in regard to the affairs of Central America were still in progress. The *Tribune* says:—"It seems that the English Government is ready to relinquish its peculiar relations with the Mosquito Kingdom, and surrender her control over San Juan. But she refuses to make that surrender into the hands of Nicaragua, which claims an unconditional right of territory to San Juan, and refuses to submit to any restrictions. There are other territorial difficulties between Nicaragua, Costa Rica, and the other States, which also seem difficult of adjustment. On these subjects Sir Henry Bulwer has addressed to the American Government a communication, urging the necessity of its interference to produce an amicable settlement of the question. The subject is now under consideration by the Secretary of State."

The extra session of the New York Legislature adjourned on the 11th ult., after passing several important enactments. The passage of the bill for the enlargement of the Erie Canal provides for the complete enlargement of that canal within four years, the immediate enlargement to the extent which would give ample other avenues to the seaboard, and endowing the state with a large revenue independent of taxes.

The overflow in the Upper Mississippi and its tributaries still continued, to the great damage of the inhabitants in the vicinity. So great a flood has never been known before since the settlement of the country. It is now more than a month since the waters began to rise, and for hundred of miles along the Mississippi, Missouri, and their tributaries, the bottom lands were completely submerged; the growing crop had been entirely destroyed—many houses washed away—a vast amount of live stock had perished—and a wide extent of territory, which promised an abundant yield, had been rendered barren and desolate for the season. The levee at the city of St. Louis had been entirely overflowed, and the warehouses filled with water to the depth of several feet. During this period business had been almost entirely suspended, as boats could receive no freight nor discharge their cargoes at the usual landings. The river was several miles wide opposite St. Louis. Great fears were entertained, that when the waters subsided, leaving a large surface of mud and vegetable matter exposed to the midsummer sun, the effect would be highly injurious to health.

The cholera was prevalent to a considerable extent in St. Louis.

The health of Mr. Fenimore Cooper had improved, and he was considered out of danger.

The Tehuantepec surveying expedition had returned to New Orleans. All the essential surveys, at least those which go to show the entire practicability of the railroad route, were complete.

A table had recently been published containing an account of the railways in the United States. The whole number of railways is 235, measuring 10,287 miles in length, and constructed at a cost of 3 6,60,394 dols.

On the night of the 17th, a frightful freshet took place in Pennsylvania, which commenced great ravages, destroying railroads, sweeping away bridges, carrying off houses, submerging lands, and washing away crops of all descriptions. Several lives were lost by this calamity.

CALIFORNIA.

The accounts from this remote quarter are fourteen days later than those previously received. Crime was increasing in a fearful ratio, and law was of little or no avail. The gangs of daring desperadoes which infested that country committed the most frightful outrages with impunity. And there was neither security for life nor property. The more respectable inhabitants of San Francisco had formed themselves into a committee of safety, for the purpose of seeing the law faithfully executed. The committee had scarcely been formed when a ruffian named Jenkins, who was one of the many bad characters that had come from Sidney, was detected in stealing a safe from an office on Long Wharf. He was taken before the committee, found guilty, and sentenced to be hanged, which order was executed within an hour from the time the solemn decree was pronounced.

M'Manus, one of the Irish political exiles, had arrived at San Francisco, where he was feasted at a public dinner, over which the Mayor presided, and at which all the distinguished men of the state were present. We announced the escape of M'Manus from Australia some weeks since.

CANADA.

From Canada we learn that the Board of Trade of Toronto had passed a vote of censure upon the council, for having memorialised the Government to impose different duties upon American manufactures.

In the Legislative Assembly a series of resolutions had been moved for the repeal of the union between Upper and Lower Canada.

Efforts were being made to construct a railroad from Halifax to Hamilton, where it is to join the Great Western, constituting a continuous line from Halifax to Detroit

The census returns for 1850 give the population of Canada at nearly 800 000.

INDIA.

The accounts this week from the East are dated respectively Bombay, June 28, and Calcutta, June 12.

The news is of little interest, universal tranquility prevailing throughout India.

Two shipwrecks are mentioned which have occurred at the entrance of Bombay harbour, one of which was attended with fearful loss of life. The ships were the *Abd Rahoman*, from Jodda, with pilgrims, and the English vessel, *Charlotte*, Captain Dowden, from Bombay. The *Abd Rahoman* struck on the island of Kenery, when upwards of 150 of the pilgrims perished. The *Charlotte* was de troyed off Jinjeerah, 20 miles south of Kenery—crew all saved [illegible]

The question of the social position of Hindoos converted to Christianity was exciting much attention. In Calcutta a large and influential meeting of Brahmins and Hindoos had been held for the purpose of considering whether the [illegible] of converted Hindoos to their cast privileges might be rendered possible, which now it is not, as a lifetime is insufficient to comply with the ceremonies prescribed as indispensable on such occasions. After a long discussion, it was agreed on the part of the Brahmins that a fine should constitute the principal condition of re-admission to the forfeited privileges of cast. This is one of the first consequences of the act of the Indian Legislature whereby a Hindoo or a Mahommedan convert to Christianity was maintained in all his [illegible] to have forfeited property, family, and every other claim, by reason of their conversion. To each a question was brought into operation very recently at Madras, in a very striking manner, by Sir W. W. Bayton, one of the judges of the supreme Court there, bringing before him the wife of a converted Hindoo, who had been abducted from her husband by her own family, and, in the face of a multitude of Brahmins, giving her up to the custody of her husband, who, he decided, had not forfeited [illegible] rights over her by abjuring his religion.

This decision has occasioned a great sensation among the native Hindoo population.

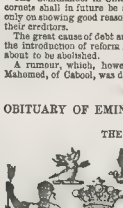
The Commander-in-Chief in India has directed that no young ensigns or cornets shall in future be allowed to exchange corps more than once, and then only on showing good reason for so doing. This is to prevent their flying from their creditors.

The great cause of debt amongst military officers was about to be removed by the introduction of reform in the system of messes—the compulsory mess being about to be abolished.

A rumour, which, however, needed confirmation, was prevalent that Dost Mahomed, of Cabool, was dead.

OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

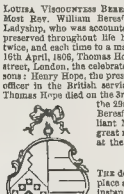
THE EARL OF CHARLEVILLE.



CHARLES WILLIAM BURY, Earl of Charleville, Viscount Charleville, and Baron Tullamore, of Tullamore, in the King's County, in the peerage of Ireland, was the only son of Charles William Bury, of Charleville Forest, near Tullamore, first Earl of Charleville of the new creation, whose wife was Catherine Maria, widow of James Tisdall, Esq., and daughter and sole Baron of Thomas Townley Dawson, Esq. The son, Charles, the second Earl, the subject of this notice, was born on the 29th of April, 1801, and married, the 26th of February, 1821, Beaujolois Harriet Charlotte, third daughter of the late Col. Campbell, of Shawfield, by his wife, the Lady Charlotte Campbell, second daughter of John, fifth Duke of Argyll, who, after Col Campbell's decease, the 17th of March, 1809, married, secondly, the 17th March, 1818, the Reverend Edmund John Bury, who died in 1832 Her Ladyship is well known as the talented and distinguished Lady Charlotte Bury. The second Earl of Charleville succeeded to the honours of his house on the demise of his father, the 31st October, 1835. His Lordship had previously, while Lord Tullamore, sat in the House of Commons as representative for Penryn, from 1832 till 1834; in politics he was a Conservative. The Earl died on the 14th instant.

LADY BERESFORD.

LOUISA VINCENNETSES BERESFORD was the fifth and youngest daughter of the Most Rev. William Beresford, first Lord Decies, Archbishop of Tuam. Her Ladyship, who was accounted one of the greatest beauties of her day, and who preserved throughout life her youthful and attractive appearance, was married twice, and each time to a man of high public distinction. She wedded, first, the 16th April, 1806, Thomas Hope, Esq., of Deepdene, in Surrey, and of Duchess-street, London, the celebrated author of "Anastasius," by whom she had three sons: Henry Hope, the present proprietor of Deepdene; Adrian Hope, a cavalry officer in the British service; and Alexander James Beresford Hope. Mr. Thomas Hope died on the 3rd February, 1831; and his widow married, secondly, the 29th November, 1832, William Carr, present Viscount Beresford, the vicar of Alkmaar, and one of the most brilliant heroes of the Peninsular war. Her Ladyship, to the great regret of all who knew her, died on the 21st instant, at the family seat, Bedgebury Park, Kent.



LADY MACKWORTH.

THE death of Phillippa, Dowager Lady Mackworth, took place at her residence in London, on Friday last, the 18th instant. Her Ladyship was the widow of the late Sir Digby Mackworth, Bart., Cavendish Hall, Suffolk, and sister of the Rev. Sir Robert Affleck, Bart., of Dalham Hall, in the same county, who died in May last. This excellent and charitable lady, who had attained the advanced age of 85 years, will be deeply regretted by her relatives and friends, and the many objects of her unostentatious bounty.

FRANCIS JAMES NEWMAN ROGERS, ESQ., Q.C., OF RAINSCOMBE, WILTS.

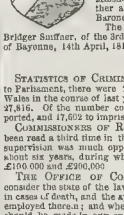
THE learned lawyer, one of her Majesty's Council, and Recorder of the City of Exeter, was born in 1791, the son of the Rev. James Rogers, of Rainscombe, and Catherine his wife, youngest daughter and co-heir of Francis Newman, Esq., of Cadbury House. His family was of great antiquity, having been seated at an early period at Bryanston, county Dorset, now the residence of Lord Portman. A direct ancestor of the gentleman whose death we record, Thomas Rogers, Esq., was Serjeant-at-Law *temp.* Edward IV.

Mr. Newman Rogers was called to the Bar by the Honourable Society of Lincoln's Inn, 21st May, 1816, and became a member of the Western Circuit, where he enjoyed a fair share of practice, and obtained a silk gown.

Mr. Rogers was a legal writer of some note. His principal works were a treatise on "The Law of Elections," and a "Practical Arrangement of Election Committees," and a "Practical Arrangement of Ecclesiastical Law."

He married, in 1892, Julia Eleanora, third daughter of William Walter Yea, Esq., of Pyrland Hall, county of Somerset, and leaves three sons and two daughters.

SIR HENRY SHIFFNER, BART., CAPTAIN R.N.



THE death of this naval officer occurred a few days since Sir Henry was born 4th November, 1789; the second son of the late Sir George Shiffner, Bart., by Mary his wife, daughter and heir of Sir John Bridger, of Combe Place, Sussex. He early entered the Royal Navy, and served on many stations. He was Lieutenant in the *Owen Glendower* at the capture of the island of Anholt, in 1809. His commission of Post Captain bears date 1819. In 1838 he was placed on half-pay; and in 1846 he accepted the retirement.

Sir Henry married, 9th of July, 1828, Emily, second daughter of the late Thomas Brooke, Esq., of Church Minshul, county of Chester, but had no issue. His brother and heir now is the Rev. Sir George Shiffner, third Baronet of Combe-place, who is married, and has children.

The deceased Baronet's eldest brother, Captain John Bridger Shiffner, of the 2nd Foot Guards, was mortally wounded at the siege of Bayonne, 14th April, 1814.

STATISTICS OF CRIMINAL OFFENDERS.—According to the returns to Parliament, there were 26,813 persons committed for trial in England and Wales in the course of last year. The number of the preceding year (1849) was 27,816. Of the number, 2,950 were ordered to find their sureties, and keep their peace, or be transported, and 17,052 to imprisonment. The number sentenced to death was 49.

COMMISSIONERS OF RAILWAYS ACT REPEAL BILL.—This bill has been read a third time in the Commons, and passed. The commission, whose superintendence was much engaged by the railway interest, has been in existence about six years, during which period it cannot have cost less than between £106 000 and £200,000

THE OFFICE OF CORONER.—The select committee appointed to consider the state of the law and practice as regards the taking of inquisitions in cases of death, and the appointment, duties, and remuneration of the officers employed therein; and whether it is expedient that any, and what, alterations should be made in any such matters, and who were empowered to report their observations to the House; have considered the matters to them referred, and have agreed to the following report:—Your committee, looking to the probable termination of the session, see no prospect of finishing their inquiry, and beg therefore to recommend the re-appointment of a committee on the subject referred to them in the ensuing session, with a view of completing the inquiry which they had been unable to finish. As the evidence is not complete, your committee have obtained from reporting it to the House."

According to the *Bristol Mirror*, the following persons connected with that city were received the last week into the Church of Rome: viz Miss Holmes, daughter of Mr. Marcus Holmes, Mr. Stob, jun., and Marshall, Esq., eldest son of the Rev. James Marshall, Christ Church, Clifton.

REPEAL OF THE WINDOW DUTY.—On Monday last the new act (14 and 15 Vict. c. 36), to repeal the window duty and to substitute a housedutty was printed. This act has a retrospective operation. The new house duty will date in England and Wales from the 5th of April last, and from Whit Sunday last in Scotland, from which time the window duty will cease and determine. The new duties are to be under the care of the Commissioners of the Inland Revenue.

On Saturday an attempt at assassination was made in a suburb of Paris, under circumstances which have stirred some sensation. A young lady of 17, who had expressed strong opposition to the intention of her mother to contract a second marriage, refused to sign the contract on the accepted terms, and said, on being asked, "I wish to know if you persist in your design to marry my mother?" On receiving an answer in the affirmative, the girl, who is of a highly respectable family, drew from beneath her mantle a pistol, which she instantly discharged at her interlocutor. The ball grazed his shoulder, and took off the hair. The young lady was conducted to the commissary of police, and, after having been interrogated was placed at the disposal of the procureur of the Republic.

Liebig, the celebrated German chemist, is about to visit Liverpool. During his stay he will be the guest of James Muspratt, Esq., of Seaforth.

IMPERIAL PARLIAMENT.

HOUSE OF COMMONS.—SATURDAY.

The House had a mid day sitting.

The Consolidated Fund (Appropriation) Bill was read a third time and passed.

The House then went into committee on the Improvement of Towns (Ireland) Bill, and passed a great many clauses after some prolonged discussion.

The report on the Patent Law Amendment Bill was brought up and agreed to.—Adjourned.

HOUSE OF LORDS.—MONDAY.

The Mercantile Marine Bill and the Merchant Seaman's Bill were read a second time.

The Public Works (Ireland) Bill was read a third time.

Several other bills were forwarded a stage.

The Episcopal and Capitular Estates Management (No. 2) Bill went through committee.

The Commons Inclosure Bill went through committee.

On the motion of the Earl of CARLISLE, the Victoria Park Bill was read a third time and passed.

SMITHFIELD.

The report of the committee on the Smithfield Market Removal Bill was brought up.

Earl GRANVILLE offered some strictures upon the clause introduced into the bill in the Commons, by which compensation was granted to the City of London corporation for the loss of privileges consequent upon the abolition of the market of Smithfield, and moved an amendment by which the compensating clause was expunged from the measure.

After some discussion, their Lordships divided upon this amendment:—Contents, 59; non-contents, 15: majority, 44. The compensation clause was consequently struck out.—Adjourned.

HOUSE OF COMMONS.—MONDAY.

The House had a mid-day sitting, when the committal of the Medical Charities (Ireland) Bill having been moved,

Sir W. SOMERVILLE stated, that the advanced period of the session left no chance of passing the bill in its existing shape, so much opposition being threatened upon its very numerous clauses. He, therefore, proposed to pass the enactments having reference to dispensaries, and abandon all the rest of the measure.

The bill thus retrenched was then allowed to pass through committee.

Sir W. SOMERVILLE afterwards announced that the Valuation (Ireland) Bill would not be pressed during the present session.

The House adjourned at three to five o'clock.

In answer to Sir H. W. Barron, Sir W. SOMERVILLE stated he would not proceed with the Improvement of Towns Bill. His intention was to proceed with the Petty Sessions and other bills.

SIR JOHN FRANKLIN.

Mr. ANSTEY gave notice it was his intention to ask the Secretary of the Admiralty whether there was any truth in the last report that had been circulated with respect to Sir John Franklin; and in case it should, like so many others, turn out to be a fabrication, whether it was the intention to put in force the law against the retailers of false news? (Hear.)

Mr. PARKER was understood to say he knew nothing of the report in question, except seeing it in the newspapers.

JEWISH DISABILITIES.—MR. SALOMONS.

The SPEAKER stated he had received the following letter from Mr. Salomons:—

Great Cumberland-place Friday, July 25, 1851.

SIR,—I am advised that it is my duty respectfully to inform you and the House, that two actions at law under this statute have been commenced against me for penalties alleged to be incurred by me, for having exercised, on Monday last, the right of sitting and voting in the House of Commons as member for Greenwich; and that at the trial of those actions any resolutions or proceeding which the House may adopt can be given in evidence in that action.

With the greatest respect, I have the honour to be, Sir,

Your most obedient servant,

DAVID SALOMONS.

To the Right Hon. the Speaker.

The order of the day was then read upon the petition from Greenwich.

Sir B. HALL moved, "That the electors of Greenwich be heard by counsel at the Bar of this House, in pursuance of the prayer of their petition presented to this House on Friday last, the 25th inst." (Hear, hear.)

Mr. ANSTEY seconded the motion

The ATTORNEY-GENERAL contended that the subject had been already so fully discussed, that no new light could be thrown upon it, and the only result from the arguments of counsel would be a further wasting of time by the Legislature.

Sir J. PAKINGTON observed that the petitioners asked in terms only to defend a right which no one contested, namely, that of electing whom they pleased as their representative.

After a miscellaneous conversation,

Mr. AGLIONBY recommended the Government to grant some delay for the purpose of considering the perplexed question, before proceeding to settle it offhand, by passing the resolution which Lord J. Russell had announced.

Lord J. RUSSELL denied that the electors of Greenwich had any *locus standi* in the House. Their privilege extended only as to the choice of the representative whom they would return, and when that was done, the function of the House such as he had suggested—simply declaring the duty that devolved on them not to admit a member who had been unable to fulfil the formalities required by law.

Mr. Alderman SIDNEY and Mr. MACGREGOR supported the motion.

The House divided:—

For the motion	..	..	..	..	.. 75
Against it	..	..	..	..	.. 135
Majority	..	..	..	..	.. —60

The motion was accordingly lost.

Mr. R. CRESSWELL said he would not, after the division which had taken place, press the case of Baron Rothschild on the attention of the House. The petition on the subject was from the electors of London, and its tenor was similar, mutatis mutandis, to that from the Greenwich electors; viz. that the petitioner be heard by counsel at the Bar.

Mr. C. ANSTEY said the hon. gentleman had, in his opinion, exercised an unwise discretion, and he would therefore take up the motion on the paper in justice to the electors of the City of London. Baron Rothschild was in a different position from Mr. Salomons; for he had not taken his seat, and was entitled to be heard at the Bar of the House.

Mr. ANTHONY supported the motion.

Mr. R. CURRIE made a somewhat spirited reply to the remarks made upon him by Mr. ANSTEY and Mr. AGLIONBY.

After some observations from Mr. NEWDEGATE,

Mr. B. OSBORNE said that Mr. Currie was a bad advocate of a good cause, and that Mr. Anstey deserved good credit for taking up the matter as he had done.

Sir J. PAKINGTON said, as a constituent of Mr. B. Osborne, to whom he had given a plumper at the last election, he felt he had a right to condemn him for the course he had pursued upon that as well as upon other occasions, and presumed the hon. gentleman had not the remotest notion of ever offering himself again to that constituency.

Mr. HOSKINS supported the motion.

After some observations in reply from Mr. ANSTEY,

The House divided, and the numbers were—

For the motion	..	..	..	..	.. 41
Against it	..	..	..	..	.. 77
Majority	..	..	..	..	.. —36

This motion was thus also lost.

The adjourned debate on Lord J. Russell's resolution, to the effect that Mr. Alderman Salomons should not be allowed to take his seat until after he should have taken the oaths prescribed by law, was resumed by

Mr. ANSTEY, who moved an amendment to the effect that the House, having regard to the religious scruples of Mr. Salomons, would exercise its undoubted right to alter the oath of adjuration so that the hon. gentleman might take it. The hon. and learned gentleman, in the course of a long speech, twice assured the House that he was not speaking against time; and also intimated his intention of pressing his amendment to a division.

After some observations from Mr. HEADLAM and Mr. J. EVANS in support of the amendment, the House divided, and the numbers were—

For the amendment	..	..	..	..	.. 50
Against it	..	..	..	..	.. 88
Majority	..	..	..	..	.. —38

The amendment was therefore rejected.

Mr. BETHELL opposed the resolution of the noble Lord, and asked him to pause before he placed the House in the false position of coming to a decision which might in a very short time be contravened by a court of law, before which the matter was now certain to be brought. He entreated of the noble Lord to allow the matter to rest as it stood for the session, and thus avoid the unpleasant dilemma which he had adverted to.

Lord J. RUSSELL said the House could not wait for the decision of a court of law in a matter in which the House itself had full jurisdiction, and he could for law in a matter in which the House itself had full jurisdiction, and he could for law in a matter how much difference between the cases of Baron Rothschild and Mr Alderman Salomons as should prevent the same resolution being adopted in both cases.

After some observations from Mr. ANSTEY and Mr. J. A. SMITH,

The House again divided, and the numbers were—

For the resolution	..	..	..	..	.. 123
Against it	..	..	..	..	.. 68
Majority	..	..	..	..	.. —55

The orders of the day were then gone through, and the House adjourned at twenty-five minutes past two.

HOUSE OF LORDS.—TUESDAY.

The Smithfield Market Removal Bill was read a third time and passed.

ECCLESIASTICAL TITLES ASSUMPTION BILL.

The Marquis of LANSDOWNE moved the third reading of the Ecclesiastical Titles Assumption Bill.

The Earl of ABERDEEN availed himself of that, the last opportunity he should have, of entering his protest against this bill, his apprehensions respecting the effects of which had not been at all removed by the discussions which had taken place. The measure had been carried by overwhelming majorities, every amendment had been successfully resisted, and yet he believed that a single individual could not be found in either House of Parliament who had given his entire approbation to the measure. There was but one point on which all the advocates of the bill seemed to agree, and that was that something should be done. He regarded as a most dangerous power the license to common informers to institute proceedings without the consent of the Attorney-General. Still he should not divide the House upon the subject, but would content himself with entering his protest against the bill upon their Lordships' journals.

The Bishop of OXFORD said that the representatives of the Church and the members of the L. gislature had distinct duties to perform, and those duties they had perf rmed. The clergy had protested against an aggression upon the Church of which they were the representatives, and the Legislature had framed a measure to check a movement which partook both of a spiritual and temporal character.

The Earl of GALLOWAY opposed the motion, believing that it would prove fatal to the peace and well being of the country.

After some observations from the Duke of Argyll, Earl Fortescue, the Earl of Glengall, Lord Nelson, and other noble Lords, the bill was read a third time.

On the question that the bill do pass,

Lord MONTEAGLE moved the insertion of an additional clause, with the view of preventing the bil. from interfering with the spiritual jurisdiction and functions of Roman Catholic bishops

The Marquis of LANSDOWNE contended that the clause, though unobjectionable, was unnecessary, as the bill would not interfere with spiritual matters.

After some observations from Lord St. Germans, the Bishop of Oxford, and Lord Cranworth,

Lord MONTEAGLE withdrew his motion.

The bill was then passed.—Adjourned.

HOUSE OF COMMONS.—TUESDAY.

The House had a mid-day sitting.

The Medical Charities (Ireland) Bill was read a third time and passed.

THE BALLOT.

Mr. H. BERKELEY brought in his bill for taking the votes of candidates at elections for members of that House by means of the ballot.

It was read a first time, and the hon. gentleman named this day month for its second reading, amid much laughter.

The remainder of the sitting was occupied in considering the Metropolitan Sewers Bill, which passed through committee.

THE HOP DUTY.

In the evening sitting,

Mr. FREWEN drew more drew attention to the Hop duties, and moved the following resolution:—"That the Excise duty on hops is impolitic and unjust, and ought to be repealed at an early period."

Mr. FULLER seconded the resolution.

Mr. J. HODGES moved, as an amendment, "That, on any reduction of Excise duty on hops taking place, it is expedient to reduce the Excise duty on British hops and the Customs duty on foreign hops by one penny per pound weight each, together with the 5 per cent. additional duty thereon granted by the act 3 Vict., c. 17."

After some observations from Mr. HARROW and Mr. CURRIE,

The CHANCELLOR of the EXCHEQUER resisted the motion on the same grounds as heretofore, having no reference to anything but the finances of the country.

After some remarks from Sir J. TYRELL, Mr. CORDEN, and Mr. BASS,

Mr. HODGES withdrew his amendment.

The House then divided on Mr. Frewen's motion, and the numbers were—

For the motion	..	..	..	..	.. 30
Against it	..	..	..	..	.. 59
Majority	..	..	..	..	.. —28

The motion was consequently lost.

RETENTION OF THE CRYSTAL PALACE.

Mr. HEYWOOD then moved that an humble address be presented to her Majesty, praying that her Majesty will be graciously pleased to direct, in such manner as to her may seem fit, that the Crystal Palace be preserved until the 1st of May next, with a view to determine if that novel structure, or any portion of it, can be adapted to purposes of public utility and recreation.

Colonel SIBTHORP strongly opposed the motion. He had from the very first opposed the Crystal Palace, which he believed to be the first step to an attack upon the people of this country; and most unhappily it had turned out that he was not mistaken. The Sabbath-day had been desecrated, and the poor had been trepanned up to town from all parts of the country to see the World's Fair. Trade had been paralysed, and there was but little in prospect for the people but poverty and poor-rates.

Mr. LABOUCHERE thought the effects of the Exhibition would be productive of the greatest benefits to trade as well as science, and the best interests of morality. Much as he was delighted with the wonderful structure raised by Mr. Paxton, he was still more delighted at seeing the orderly demeanour of the hundreds of thousands of visitors to the Exhibition. Not a single case had occurred demanding magisterial investigation; and it was also most gratifying, that, although our streets were crowded with foreigners beyond all former precedent, the public peace had never been broken, and those foreigners must have noticed, that, without the slightest exhibition of military force, everything was as quiet and orderly as possible. With respect to the retention of the Palace, he could only say that he himself, as a Commissioner, would not feel himself authorised to retain those buildings in their present form, unless there should be a very unequivocal expression of public opinion to the contrary.

After a short conversation,

Lord SEYMOUR said that his desire to maintain good faith with the public would make him vote against the motion.

After some observations from Mr VILLIERS and Mr. CLAY,

The CHANCELLOR of the EXCHEQUER objected to the motion on the ground of the expense which turning it into a winter garden would entail on the public. He also thought that good faith demanded the Building should be taken down. Like Mr. Labouchere, he would give no vote on the subject; but it was agreed that if the Government he felt bound to have the Building taken down, unless there should be such an unequivocal expression of opinion by the House as should warrant them in adopting a different course.

After some discussion,

The House divided, and the numbers were:—

For the motion	..	..	..	..	.. 75
Against it	..	..	..	..	.. 47
Majority	..	..	..	..	.. —28

The motion was accordingly agreed to.

Mr. ANSTEY then rose to move an address to her Majesty with a view to the cessation of transportation to Van Diemen's Land; but while the hon. gentleman was addressing himself to the subject, the House was counted out.

HOUSE OF LORDS.—WEDNESDAY.

Their Lordships had a short sitting.

The report on the Charitable Trusts Bill was brought up, and several private and public bills were forwarded a stage.—Adjourned.

HOUSE OF COMMONS.—WEDNESDAY.

The House sat from noon to six o'clock.

STEAM COMMUNICATION WITH AUSTRALIA.

In answer to Mr. Henley,

The CHANCELLOR of the EXCHEQUER said that no steps had as yet been taken for establishing steam communication between the Cape and Sidney. He was not prepared to say that so expensive a scheme would be adopted.

Lord JOCELYN denied that the proposed step, which had been recommended by the committee of which he had been chairman, would cause great expense; on the contrary, the committee had arrived at the conclusion, that the route in question would be the cheapest.

On the motion for going into committee on the Patent Law Amendment Bill,

Mr. T. EGERTON objected to proceeding with it at such a period of the session.

The CHANCELLOR of the EXCHEQUER said that the bill had been fully considered in the House of Lords, and urged the proceeding with it.

Sir F. Thesiger. Mr. Macgregor, and Sir De Lacy Evans having spoken, the former in favour of, the two latter against postponement,

The SOLICITOR-GENERAL said that 500 persons had taken out protections for articles exhibited at the Great Exhibition, and were waiting to take out patents under the proposed measures.

Mr. T. GREEN objected to the practice of allowing a patentee six months to specify, and said that the bill, as it stood, would have the effect of cheating the intellects of the country of many of their best works.

Mr. CARDWELL would support the bill, but not as a settlement of the patent laws, which required thorough reform, to effect which object he hoped Government would next session appoint a select committee

Lord J. RUSSELL said that Mr. Cardwell's suggestion should be taken into consideration. The Government regarded the present bill only as an improvement of the law as it stood.

The bill then went through committee *pro formâ*.

CHURCH BUILDINGS ACT.

The House went into committee on the Church Buildings Acts Amendment Bill. The first clause was struck out, and clauses 2 to 28 inclusive were agreed to. A discussion arose on a clause proposed by Mr. Frewen, providing for the case of the avoidance of a benefice with no church or chapel attached, which clause, upon division, was carried by 40 to 37; majority in its favour, 3. It was finally agreed that the Solicitor-General should draw up a clause on the subject, with certain alterations suggested by Mr. Gladstone.

The Petty Sessions (Ireland) Bill was partially considered in committee.—Adjourned.

HOUSE OF LORDS.—THURSDAY.

The Court of Chancery and Judicial Committee Bill and the Medical Charities (Ireland) Bill were read a second time.

The Ecclesiastical Residences (Ireland) Bill was reported.

The Leasehold Tenure of Land (Ireland) Act Amendment was read a third time and passed.

The Mercantile Marine Act Amendment Bill passed through committee.

SANITARY STATE OF THE METROPOLIS.

The Earl of SHAFTESBURY moved that an humble address be presented to her Majesty, praying her Majesty to take into consideration the sanitary state of the metropolis, with a view to such amendments in the Nuisances Removal and Diseases Prevention Act as may appear to be required.—Agreed to.—Adjourned.

HOUSE OF COMMONS.—THURSDAY.

The House had a mid-day sitting.

The Sheriffs of the City of London appeared at the Bar, and presented a petition from the Lord Mayor, Aldermen, and Common Council of London against the dissolution of the present Water Companies.

The Con. Duties (London and Westminster, and adjacent counties) Bill was read a third time and passed.

RETENTION OF THE CRYSTAL PALACE.

In answer to a question from Mr. B. OSBORNE, with respect to the retention of the Crystal Palace, whether the Chancellor of the Exchequer was prepared to give notice for its retention,

The CHANCELLOR of the EXCHEQUER said, that, by an engagement between the Commissioners and the contractors, the Commissioners were bound to pay an additional sum to the contractors if they did not give notice by the 1st of September that the Palace was to be taken down. The Commissioners had a considerable surplus in hand; but if the public were to have it kept up, the public would be subject to the responsibility of retaining it as well as maintaining the Building.

Mr. WALKER understood the right hon. gentleman, on a former occasion, to say, that no claim would be made on the Consolidated Fund in case the Building were kept up.

The CHANCELLOR of the EXCHEQUER had not said so. The contractors were willing to keep up the Palace to the 1st of May, if they got compensation.

METROPOLITAN SEWERS BILL.

On the motion for the third reading of this bill,

Sir B. HALL objected to the appointment of a barrister as a chairman at a salary of £1000 a year, and of another briefless barrister as secretary, at £500 a year, with an engineer besides at £1500. The House had not, by next session a new bill would be introduced, and that an alteration would be made to improve the constitution of the board.

Mr. WALKER objected strongly to the appointment of barristers to offices for which they were entirely unfitted. He deprecated the introduction of such a measure at so late a period of the session. He protested against it altogether.

In reply to Mr. B. Osborne, the CHANCELLOR of the EXCHEQUER said the chairman had not yet been appointed.

The bill was read a third time and passed.

METROPOLITAN INTERMENTS BILL.

The House went into committee on this bill.

Mr. WALKER was strongly opposed to the power proposed to be conferred by this bill on the Board of Health, to obtain money from the Chancellor of the Exchequer to buy burial-grounds, and then to lay a penny rate on the public to pay for them.

The bill, after some opposition, passed through committee.

Several bills were forwarded a stage; and the sitting was suspended until a quarter past five o'clock.

In the evening sitting,

THE EPISCOPAL AND CAPITULAR ESTATES MANAGEMENT (No. 2) BILL.

On the motion for the second reading of this bill,

Colonel CHARTERIS objected to going on with a bill of this importance at so late a period of the session. The attempt to smuggle it was certainly very assinine. He thought it was unbecoming, to say the least of it, for the Government to push it forward. He should, therefore, take the sense of the House upon the question, that this bill be read a second time this day six months.

Sir B. HALL thought that before they went on with this bill they ought to have an explanation from the Government of what was the real opinion of the commissioners who had been appointed to inquire into the subject, since the bill was certainly not founded on the report which had been presented.

The CHANCELLOR of the EXCHEQUER could not see what objection there could be to the present bill, since every improvement which it proposed was not for the benefit of any particular individual, but for the benefit of the whole in general. The scheme of the bill was in his opinion a much better scheme than the one recommended by the Commissioners.

After considerable discussion the House divided. For the second reading, 45; against it, 34; majority, 11. The bill was then read a second time.—Adjourned.

ALLEGED DISCOVERY OF PART OF SIR JOHN FRANKLIN'S CREW

The following paragraph, which appears in the *Dundee Warder* of Friday (last week), requires confirmation:—

"On Saturday, the 19th inst., the whaler *Flora*, of Hull, J. Robb, master, who has been out a year and a half, cast anchor at Stromness, and sent her letters and papers by post

"A letter was received in Aberdeen on Monday, by Mr. John Douglas, from his brother, Mr. G. Douglas, mate of the aforesaid ship. It contains the following affecting narrative:—In February last our ship's crew partially abandoned the vessel, and erected a large snow-house on shore, it being in many respects more comfortable than on board, and better suited for hunting operations. We had been at that time five months frozen up in Lancaster Sound. In one of our excursions we fell in with a party of Esquimaux Indians, nine in number. They had a slight knowledge of our language. They inquired whether we were English or American. On being satisfied on that point, they inquired if we belonged to Chief Franklin. The idea now flashed upon our minds that they knew something of Sir John and his crew, and we answered in the affirmative. They then pointed to the right, to a towering heap of snowy mountains, and by their gestures they signified they had gone to sleep. We brought them to our snow-house, when I and eight of my men should accompany the Indians, and probe their story to the foundation. The party consisted of Mr. Page (our surgeon), J. Brown (carpenter), Wilson, Blair, Hall, Morgan, Anderson, Gowley, Jones, Jenkinson, Rafferty (seamen), and myself. We had a plentiful supply of provisions, which were packed in a flat-bottomed boat, which was covered with seal-skin; and several rifles, spears, &c. We started on our journey on March 27; our route was one of which, whither they can be conjectured. We proceeded in a sig-zag course up one hill, down another, then to the right, then to the left, and then to the right again. On the fourth day symptoms of discontent to be the manifested by the dog-sledge laddy tars. Our feet were cut and wounded by the sharp projecting fragments of ice; the thaw was setting in, and we were apprehensive of being buried by the avalanches of snow, which descend like lightning down the sides of the mountains. On the tenth day, April 8th, our guides led us into a large natural amphitheatre among the mountains. After a journey of some miles, we descr ed something waving over the snow. It was a black silk handkerchief tied to the top of a walking-stick. We eagerly drew out the staff, and commenced operations by digging about two feet deep. We came to the body of a man, and in a few minutes after we discovered three other bodies. They were frozen like bodies, decomposition had not commenced. Their beards were long and shaggy, while their rigid features and wasted limbs spoke in the language of nature—they had died from want.

"Their dress was that of British seamen in cold latitudes. One man had his name written, or rather engraved on his arm, H. Carr. They were all more or less marked; some had crosses on their breasts, others stars, ships, letters, &c. Our hearts sickened at the sight. We replaced them in their cold desolate graves, and set up the same sad *memento mori*. 'Poor fellows,' I exclaimed, 'you have attempted to regain your home by an overland journey, but you are left in the desert!'

"The Indians could give us no more intelligence, so we returned. The most probable conjecture is, a large party had set out from Sir John Franklin's expedition; four had thus perished; in all probability the whole of them are now dead."

The letter is signed "Thomas Reid," and is dated "Dundee, July 22, 1851."

MILITIA PAY.—Mr. Ralph Bernal, Sir George Grey, and Mr. C. Lewis have brought a bill into the House of Commons to defray the charge of the pay, clothing, and contingent and other expenses of the disembodied militia in the United Kingdom, to grant allowances in certain cases to subaltern officers, adjutants, surgeons, &c., and to authorise the employment of the non-commissioned officers. The rates of pay, &c., will be inserted in the bill in committee.

ROYAL YACHT SQUADRON REGATTA.—The members of the Royal Yacht Squadron have given a cup, value £100, to be sailed for by yacht clubs of all nations, on the 22nd of August. The Royal Yacht Club dinner is to take place at the Squadron House on the 19th of August. Her Majesty's Cup is to be sailed for by cutters of the Royal Yacht Squadron, 105 tons and upwards, on the 20th; of three and four tons, between 50 to 100 tons. Prince Albert's Cup is to be sailed for on the 20th by schooners of 140 tons and upwards, if enough do not enter, then by schooners under 140 tons. The annual Royal Yacht Squadron ball is to take place on the 21st; the fireworks on the evening of the 22nd.

A bill has been brought into the House of Commons by Lord Seymour and Mr. C. Lewis for confirming the provisional orders of the general Board of Health, referring to the following places, viz. Morpeth, Bristol, Worthing, Beverley, Sherborne, Bridgend, Bryn Mawr, Norwich, Margate, Weymouth, Newmarket, Romford, Tenby, Kingston-upon-Hull, and Hertford.

REPRESENTATION OF LIMERICK.—The Earl of Arundel and Surrey has been received with great enthusiasm at Limerick. On Monday, immediately on his arrival, the following address was presented to him:—

"It is with pride and gratification that we, the Catholics of Limerick, bid you welcome to our ancient city. Selected by us as the exponent of our opinions and the representative of our sacred cause in Parliament, we tender it to you in the honourable trust, and, animated by the same sentiments, and actuated by the same great duty, you have unhesitating y responded to same sentiments, and actuated by the same great duty, you have unhesitating y responded to our call. For the first time in history, the cause of England and Irel nd is one and the same our call. For the first time in history, the cause of England and Irel nd is one and the same cause—the vindication of religious liberty. Under that holy standard, with you for our leader, there can be but one result—peace, happy homes and altars free."

His Lordship, in reply, observed that he felt deeply grateful for the mark of respect and attention which had been shown him, and he hoped to prove deserving of their confidence. The noble Earl, on the occasion, leaned on the arm of the Roman Catholic Bishop, the Right Rev. Dr. Ryan, who travelled with his Lordship from Dublin, from the railway terminus to the committee-rooms.

REPRESENTATION OF GREENWICH.—In the event of a vacancy occurring in the representation of this borough, Mr. M. Merryweather Turner has announced his intention of offering himself as a candidate. He professes Ministerial principles.

THE BAGNO OF NISIDA, THE PRISON OF CARLO POERIO.

STATE PROSECUTIONS OF THE NEAPOLITAN GOVERNMENT.

WE are enabled, from the sketch-book of a Correspondent, to illustrate one of the gloomy prison-houses in which Carlo Poerio, the ex-Minister of Naples, was confined by verdict of the Grand Criminal Court, as described by Mr. Gladstone, in the first of his letters to the Earl of Aberdeen. As the description of this *Bagno* of Nisida was quoted in our Journal of last week (see page 111), we need not here repeat the passage. It appears that the practice of chaining two prisoners together was introduced at Nisida, for the sake of Poerio and his fellow-prisoners. Mr. Gladstone adds . -

I was assured that two or three weeks before, among 800 prisoners in the *bagno* (which to the passer-by looks hardly bigger than a martello tower), these double irons were totally unknown; and there were many political offenders then there, but they were men of the lower class, to whom this kind of punishment would have been but a slight addition. But just about the time when Poerio and his companions were sent to Nisida, an order came from Prince Luigi, the brother of the King, who, as admiral, has charge of the island, ordering that double irons should be used for these who had been brought into the prison since a certain rather recent date—I think, July 22, 1850. Thus it was contrived to have them put on Poerio and his friends, and yet to have a plea, such as it is, for saying that the measure was not adopted with a view to their case, and to the extreme moral (as well as the not slight physical) suffering which it would secure for them. Among these, as I had already said, had been chained together the informer Margherita and one of his victims. Among these, I myself saw a political prisoner. Romeo, chained in the manner I have described to an ordinary offender, a young man with one of the most ferocious and sullen countenances I have seen among many hundreds of the Neapolitan criminals.

The Inspecter of this prison, General Palomba, had, I was informed, never, or not for a very long time, visited it. But he had come just before I was there; and it is impossible to avoid the inference, that he came in order to make certain that the orders for increased severity were not evaded or relaxed.

Our correspondent has furnished us with the following strong confirmation of Mr. Gladstone's conviction, "that it is often desired to obtain the scaffold's aim without the outcry which the scaffold would create."

In 1847, the prison of Castellamare was in such a ruinous state that two sentires were placed on the road to prevent any carriage passing it, except at a foot pace, from fear of its being thrown down by the concussion, it being in so dilapidated a state, from a fire some years before; and yet in those black walls were every night confined from 700 to 800 convicts, employed by day at the dock-yards of Castellamare. The King could not be in ignorance of this, as he passed his summer months there, and almost daily visited the dock-yards adjoining it.

It is the common practice in Italy to condemn to death without the executioner's hand: a disaffected regiment may easier be got rid of by being sent to encamp at the swamps of Capua than by court-martial, when the uniforms returning in cartloads to the stores is the only telltale; or an inquiring *religieuse* ordered to a monastery so unhealthy that a second spring never greets its inmates, the malaria being as deadly as the axe.

CLOCKMAKING.—Mr. Matthew Litchfield, of Sutton-in-Ashfield, has just completed an elaborate time-piece, or astronomical clock. It shows the time of the sun's rising southing, and setting; his right ascension and declination, and his place in the ecliptic for every day in the year. The age and phases of the moon, her right ascension and declination; the time of her rising and setting, the time she comes to the meridian, and her place in the ecliptic for every day in the year. The rising, southing, and setting of the stars of the first, second, and third magnitudes, their diurnal and annual revolutions, with the time of their coming to the meridian, for every day in the year; likewise, the right day of the month for every day of the year.

LYNCH LAW AMONGST THE SCHOOLMASTERS.—(*From a New York paper.*)—At the general meeting of governors and parents, specially convened, resolved unanimously, that, as Mr. Morrison has not yet thought fit to lower the charges for boarders in his establishment, in accordance with the reduced prices of fixings of all kinds, and moreover has, without the concurrence of any governor or parent interested in his school, taken upon himself to extend the time of the usual half-yearly vacation, each parent or guardian be authorised and desired to deduct from the next account of his son or ward 25 per cent. for the reduction in the price of fixings, and 5 per cent. additional from the remaining sum for each week's extra holiday so given by Mr. Morrison to his own pocket.—New York, June 23, 1851.

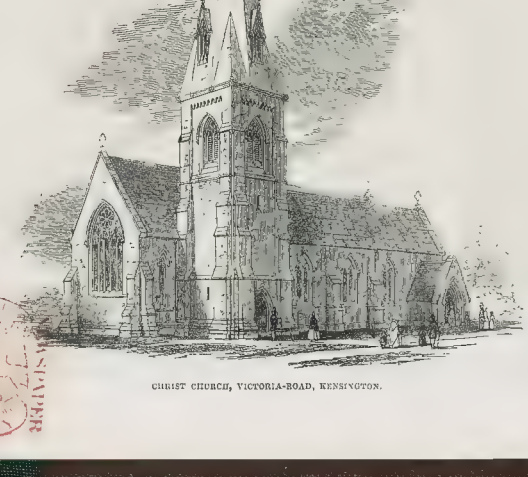
A dinner was given on Saturday, at M. Soyer's Symposium, to a body of French mechanics, who have been sent over to this country by the Commissioners for France to visit the Great Exhibition. Among the English guests who were present were Mr. Fox, of the firm of Messrs. Fox and Henderson, who, in reply to the toast of his health, which was eloquently proposed by one of the *ouvriers*, expressed the satisfaction with which he viewed such a demonstration of friendship and good-will. The exhibition, he remarked, would be a great instrument in the promotion of the peace of the world, a sentiment which obtained the cordial assent of the meeting.

CHRIST CHURCH, KENSINGTON.

THIS edifice, of very neat design, is situated in Victoria-road, and was consecrated on Wednesday, the 23d ult., by the Bishop of the diocese. The Church, which is not at present a district, has been built to accommodate the over-crowded congregation of the parish church of St. Mary Abbotts. The first stone was laid by the Vicar, the Archdeacon of Middlesex, on Wednesday, the 24th of July, 1850. The architect was Mr. Benjamin Ferrey; the builder was Mr. Myers. The architecture is of the Decorated style, varying from geometrical to flowing. The ground-plan comprises a chancel, upwards of 30 feet long; a nave of five bays, with aisles; a north porch; and a tower and spire at the east end of the north aisle (opening by an arch into the chancel), of a total length of 120 feet. The pillars of the nave are octagonal; the chancel arch is lofty, springing from clustered piers, the roofs are all of open timber; the chancel is fitted with longitudinal stall-like benches, and the organ (an excellent instrument, by Houlditch) is placed on one side, under the inner arch. The windows throughout are of flowered quarries, by Messrs. Powell, of Whitefriars; the east window is a rich diaper pattern, copied from York Minster. The communion-plate was presented by J. Merriman, Esq.; the altar chairs by W. F. Wolley, Esq., of Campden House; and the altar-cloth by Dr. Philp. The pulpit is an elegant one of stone. The whole of the Church is paved with Minton's tiles. The decorations of the chancel are not yet completed but a considerable amount of coloured diaper-work is contemplated. All the seats are open, and will accommodate from 700 to 800 persons. The total cost of the building and fittings has been about £5000.

The site of the Church was presented by H. L. Vallotton, Esq., of Hyde Park-gate, the principal proprietor of the neighbourhood. The Church was well filled on the day of consecration, in spite of the unfavourable state of the weather. An excellent sermon was preached by the Bishop, from St. John, xx. 19, which realised a collection, towards the building fund, of £120.

At the conclusion of the service, about seventy of the chief clergy and gentry adjourned to the vicarage, where an elegant collation had been provided by the Archdeacon. The customary loyal toasts were given,



CHRIST CHURCH, VICTORIA-ROAD, KENSINGTON.

and the Bishop, after an able speech from the Archdeacon, alluded to the great want of Church accommodation still existing in the parish, notwithstanding the three churches that had been erected during the incumbency of the present Vicar: his Lordship stated that he hoped to be called upon, before very long, to consecrate another church; and that he should rejoice to see the day when he should be able to crown the whole by consecrating a noble parish church, in all respects worthy of the opulence and respectability of the neighbourhood.

THE LATE MARSHAL SEBASTIANI.

FRANCIS HORACE DE SEBASTIANI, a Marshal of France, and a soldier of the Republic the Empire, and the Monarchy, sprang from a family connected with that of Napoleon. Sebastiani was born in 1773, and commenced his military career very early in life: he was a Colonel of Dragoons at the period of the celebrated 18th Brumaire. Having then acted a part which pleased Napoleon, he rose rapidly in favour and in fame. His subsequent career was most brilliant. His name continually appears in connexion with the terrible wars of France in Germany, the Peninsula, and Russia. He shared in the defence of the French territory in 1814, and he fought at Waterloo. At the battle of Austerlitz, Sebastiani was highly distinguished; and, immediately after that victory, his Imperial master, as a strong mark of his esteem and confidence, sent him to Constantinople to negotiate an alliance between the Sultan Selim and France, for

THE LATE MARSHAL SEBASTIANI.

shutting the entry of the Dardanelles against the British fleet. He there first gave proof of his diplomatic talents. After the fall of Napoleon and the return of the Bourbons, Sebastiani joined the Opposition in the Chamber of Deputies, and continued to act with it throughout the period of the Restoration. The revolution of July, 1830, found in him an ardent supporter, and his conduct in aiding that great event obtained for him the lasting friendship and gratitude of Louis Philippe. General Sebastiani, on the establishment of the new Government, went first as Ambassador to Naples, and after that as Ambassador to London. He received from the King of the French, on October 21, 1840, the *bâton* of a Marshal of France; and every honour and happiness appeared to attend his old age, when a frightful domestic tragedy destroyed his peace and that of his family for ever. The Marshal's daughter, the Duchess of Choiseul-Praslin, was, on the 18th of August, 1847, assassinated by the Duke her husband, who poisoned himself in the prison of the Luxembourg. Her father never recovered the shock. He retired from public life, but, on the breaking out of the revolution which dethroned Louis Philippe, he once more came forward to aid the King with his counsel. Unfortunately for the Monarch, his advice, dictated by wisdom and gratitude, could not be followed. Marshal Sebastiani died at Paris, on the 21st ultimo, in the seventy-ninth year of his age.

THE GUERNSEY RACE-PLATE.

THIS superb piece of plate is "the Queen's Cup," presented by her Majesty to the inhabitants of Guernsey, and to be contested for at the races held on the 16th and 17th inst. The Cup is of elegant design, with *cinque-cento* enrichments, and the introduction of dolphins, peculiarly characteristic for an island prize. It is from the establishment of Mr Dobson, silversmith to her Majesty, 32, Piccadilly.

THE GUERNSEY RACE CUP, 1851.—PRESENTED BY HER MAJESTY.

PARIS FASHIONS FOR AUGUST.

PARIS FASHIONS FOR AUGUST.

All the brilliant *toilettes* appear to have left Paris for Vichy and Baden Still, as the fashions are made up in Paris, if we cannot see all the charming novelties worn, we can glance at the toilets most admired at the various watering-places. The materials, of course, are of the lightest texture imaginable. Poplin is superseded by the new Scotch *popilinette*, which is well adapted for travelling, because it does not tumble; and, as it is worn without flounces, it can be packed in trunks without inconvenience. Now that embroidery is so much sought after, *canezous* are much the fashion: they are generally made of embroidered muslin, with *point d'armes*, the richest kind of embroidery. They are worn with *barèye* skirts, with flowered or square (kind of plaid) patterns, trimmed with flounces. A scarf or plain pointed shawl of black lace completes this charming morning visiting dress.

For evening, light ball dresses, mostly of white muslin, are worn low; and the indispensable ornaments of such a *toilette* are n atural flowers.

Our duty as chroniclers of fashion obliges us to mention all novelties. It is with regret we have to speak of a fancy which appeared some time back, but only as a fancy, when we remained silent upon the subject; but now it threatens to become a fashion, we must caution our fair readers to hesitate before they adopt the innovation. What think you of a waistcoat—a man's waistcoat!—of white *piqué*, with diamond or malachite buttons?

THE ILLUSTRATIONS.

Leghorn straw bonnet, trimmed with two bunches of short plumes. Dress of *popilinette* with pattern, plain ground; trimmed with three flounces, edged with plaid ribbon; body open in front, and kept in place by three *lacés* of ribbon to match. *Fichus* of English lace, wide sleeves, with under-sleeves, also of English lace; pointed shawl, of plain black lace.

2. A Bonnet of embroidered straw, with spreading front, trimmed with green, red, or white poppies: these last are charming. Albanaise dress, mallow-coloured, with *pardessus* of the same; white *piqué* waistcoat, trimmed with double row of buttons; *fichu*, trimmed with Valenciennes lace.

The cape and crown of cape are trimmed with Malines lace in two rows, mingling with the bunches of striped ribbon, laid on flat.

Scarf of black net, trimmed with velvet lace, laid on flat; the lace is sometimes of different widths, set on according to taste, and trimmed with a lace flounce; they are also made trimmed with two flounces instead of two *fichus à colonne* (that is, with a white stripe) with inlet.

Closed under-sleeve, trimmed with an inlet, also with two rows of Malines lace. There are other under-sleeves of muslin, open and trimmed with two rows of English lace. Canezou of Indian muslin, trimmed with embroidery *à l'Anglaises*, with a shoulder-band, and small skirts; and just above the skirts a fancy ribbon, closed by two bunches without ends.

LOCKS AND LOCK-PICKING.

WITH A PORTRAIT OF MR. A. C. HOBBS.

In our last week's Supplement we gave Engravings and descriptions of Chubb's Detector Lock, and Newell's (of America) Parnutoptic Lock (A. C. Hobbs proprietor), and also referred to the exciting challenges then pending with respect to the picking of those locks and others heretofore considered impregnable.

For some time past Mr. Hobbs has upon more than one occasion hinted at the possibility of opening, without keys, those locks which had heretofore been considered as possessing the great desideratum of perfect security. In order to put the matter to a test, a number of gentlemen were invited to be present at No. 94, Great George-street, Westminster, to meet Mr. Hobbs, for the purpose of affording him an opportunity of operating upon a lock which, some months since, was placed on the door of one of the vaults of the State Paper Office. Several gentlemen accordingly assembled, among whom were Mr. Porter, the secretary of the Board of Trade; Mr. Biddle, of the Great Exhibition; Mr. Peabody; Mr. Schenck, engineer

MR. HOBBS.—FROM A DAGUERREOTYPE BY MAYALL

Mr. Bell, and several other gentlemen. The lock having been examined and found to be fairly locked, Mr. Hobbs produced from his waistcoat pocket two or three small and simple-looking tools, and proceeded to work. Within twenty-five minutes from the time of commencing, the bolt of the lock flew back, and the door was opened. It was then suggested by one of the gentlemen present that Mr. Hobbs should turn the bolt back again, and lock the door; it being a "detector" lock, it was considered he would be unable to accomplish this feat. In less than ten minutes, however, the door was again locked—no injury whatever was done to the interior of the lock, and no traces were to be seen of its having been picked. The lock in question bore the stamp of "Chubb's New Patent."

As may be imagined, this performance created a great deal of excite-

ment in the world interested in locks and keys; and a committee, consisting of Mr G. Rennie, Professor Cowper, and Dr. Black, was immediately appointed for the purpose of making arrangements for allowing Mr. Hobbs to try his skill upon the mysterious lock so long exhibited in the window of Mr. Bramah, in Piccadilly, with the tempting announcement, in letters of gold, offering a reward of £200 to any one who should pick it. In short, this challenge, so long unheeded, has at length been accepted. The monster lock has been removed from its long resting-place in Mr. Bramah's window to an upper room in the house; where, it having been placed between two boards, which have been sealed by the committee, Mr. Hobbs at once commenced operations upon it. Thirty days are by agreement to be allowed for the experiments. By the end of that time, if Mr. Hobbs shall not have succeeded, he will have to confess himself beaten *quoad* the lock in question, which will then, doubtless, be restored with honour to its old position in Messrs. Bramah's window.

Meantime, it may be interesting to go back into the history of the affair, and to look a little into the subject of locks and lock-picking in general.

This subject was brought under the consideration of the Institution of Mechanical Engineers, at their meeting on the 30th of June, when Mr. Hodges read a paper on the progress of lock improvement which was followed by an animated discussion, in which Mr. Chubb and Mr. Hobbs took part. At this meeting, the challenge given by Mr. Chubb relative to the picking of his lock was formally accepted by Mr. Hobbs, who, in his turn, held out a challenge respecting the Newell lock in the following terms:—"That a party might take any commercial lock (of the Newell patents), examine it as much as he pleased, without limit of time, and take the lock to pieces and put it together again in the presence of competent persons; the lock to be then locked in their presence; and that the party could pick it in any time, and after any number of trials, a prize of £1000 would be given."

In consideration of the interest very naturally excited in the public mind, and particularly amongst commercial communities, by the performances of Mr. Hobbs, and the consequences which they seem to involve, we have devoted some attention to the subject, with the hope of being able to give our readers a popular account on of the rationale of the principles upon which Mr. Hobbs operates in lock-picking.

Taking Chubb's lock as the last and most striking example. As we explained in our short descriptive article last week, and as all who have ever seen a Chubb lock pretty well understand, the security of that lock consists in a set of tumblers ranged side by side—say half a dozen in number—which have to be raised to different heights, and which must be operated upon by "bitts" in the key, such "bitts" being more or less long, according as the tumbler each is to act upon is to be raised higher or lower. Until all these tumblers are raised with exactness to their respective positions the bolt is not liberated, and will not turn with the key; but as soon as they are all so elevated, the bolt will yield backwards to any force applied in the proper direction. In writing about picking one of these locks, Mr. Hobbs commences by supposing that the bolt would yield to force applied in the right direction but for certain obstructions, which it becomes his business to remove. Accordingly, he introduces into the lock a sort of skeleton key, or pick-lock, with which he presses the bolt in the direction backwards; and to the other end of that instrument, on a lever arm, he puts a weight, which keeps the pressure of the bitt constantly against the bolt: he then proceeds, by means of a very simple implement, to lift the tumblers one by one—an operation of considerable nicety, requiring great delicacy of touch; and, as he so lifts them successively to the right places, they are retained there, removing, one by one, the several obstructions against the backward movement of the bolt; so that, when the last tumbler is raised, the bolt is entirely free, and flies back by the pressure kept on it by the lever before mentioned, and the lock is opened. To re-lock it, it is only necessary to reverse the process just described. We shall next week consider the subject further, shewing in what the principle of the Newell lock differs from the tumbler locks hitherto in use in Europe.

MIDDLESEX COUNTY LUNATIC ASYLUM, COLNEY HATCH.

THIS new Asylum has just been completed, and on the 1st ult. was inspected by the "justices, clergy, boards of guardians, and parochial officers within the county of Middlesex." On the same day, the burial-ground attached to the Asylum was consecrated by the Bishop of London; and our Artist has represented this brief but impressive ceremony. The spot selected was inclosed and covered by a tent. In the foreground of the picture, Mr. Murray is reading the deed of conveyance, which he afterwards delivered to the Bishop's chaplain, who stands at the head of the table, between the Bishop and one of the Chaplains of the Asylum. The deed of conveyance being presented by the proctor to the Bishop, his Lordship delivered a short address, followed by a prayer, with which the consecration terminated.

The visitors were then shown over the Asylum, and in the course of their inspection frequent must have been the melancholy reflection that the most grievous affliction to which the flesh is heir should demand this vast building for the sufferers. Still, this thought was followed by the consolatory evidence, that wherever human skill could effect in mitigating the frightful suffering, had been here attempted, and that such a "happy haven" had been reared. In the course of the day, Mr. B. Rotch, the excellent chairman of the Magistrates' Committee, took occasion to congratulate the county upon the work at last accomplished, and ventured to predict that even those who had most opposed the scheme at first would now concede its advantages, allow that it was economical, and at least not deny that it was something to be proud of as a model institution for the world.

It will be interesting to add, that her Majesty has originated a fund to be called the "Victoria fund," which is to be applied to the assistance of those persons who leave the asylum cured, but who, when they leave it, may be without friends or means of self-support. Prince Albert, it is stated, also takes great interest in the institution. The first stone of the building was laid by his Royal Highness on May 8, 1840; and a view of the edifice, as now completed, appeared in the ILLUSTRATED LONDON NEWS, No. 370. The length of the main building of the Asylum is 1884 feet, or 36 feet longer than the Crystal Palace, in Hyde Park.

CALENDAR FOR THE WEEK.

SUNDAY, August 3.—Seventh Sunday after Trinity.
MONDAY, 4.—East India Docks opened, 1805.
TUESDAY, 5.—Oyster season commences.
WEDNESDAY, 6.—Prince Alfred born, 1844.
THURSDAY, 7.—Queen Caroline died, 1821.
FRIDAY, 8.—George Canning died, 1827. Marshal Ney shot, 1815.
SATURDAY, 9.—Accession of Louis Philippe to the French throne, 1830.

On peut se les procurer séparément, ou réunis en une brochure, avec une couverture magnifiquement illustrée. Prix des Cahiers contenant Douze Numéros et une magnifique Vue du Palais de Crystal tirée à part, 6 shillings.

NATIONAL ILLUSTRATED LIBRARY.
In Monthly Volumes, copiously Illustrated, price 2s. 6d.
Just published,
THE MORMONS, a Contemporary History; or, Memoirs of the Life and Death of JOSEPH SMITH, the American Mahomet. In One Vol. Price 2s. 6d.

"The contents of this volume are curious and interesting to the highest degree, containing as they do the first full and fair account which has been given to the world of the new religion called Mormonism, and of Joe Smith, its founder."—*Atlas.*

"One of the most painfully instructive volumes that ever issued from the press."—*Witness.*

"One of the most remarkable events in modern history has been the rise and progress of the Mormonites; it is, perhaps, unparalleled in the history of the world. The author has performed his task with impartiality and care."—*Standard of Freedom.*

"An extremely interesting work. The author gives the details of the history of the American Impostor and his followers with candour so essential to historical narrative. The incidents are so numerous, exciting, and tragical, that the work has all the fascination of a romance, and cannot fail to attract very general attention."—*Glasgow Examiner.*

In preparation, a variety of original works. The Third Volume of BOSWELL'S LIFE of JOHNSON will be published on the 15th August, price 2s. 6d.

Office, 198, Strand.
